# THE ARCHITECT

## A JOURNAL OF ART, CIVIL ENGINEERING, AND BUILDING

### THE ARTISTIC EVOLUTION OF ARCHITECTURE.

At the opening of a new year it may be not inappropriate to take a glance at our great master-art of architecture, if only in humble recognition of the scientific spirit of the age, as an enterprise of human intellect which has reached a point of development far from the beginning, and why not still farther from the end? The indomitable perseverance of physical research, within the personal recollection of men of five-and-forty, has been, as it were, unearthing the very arcana of nature's creative operations, and with a

success which, to many of the most estimable amongst us, seems not only bewildering, but alarming; until at length, by the necromancy of inductive demonstration, the very well-springs of society, with all its diverse customs, laws, moralities, myths, traditions of hope and fear, its histories of peace and war, its arts and sciences, its liberties, slaveries, ascendancies, authorities, its good and evil of every kind, are threatened with intimate discovery, and the elements of responsibility itself with reduction *secundum artem* to first principles of necessity as the simplest rule of law. In such circumstances it may be said to be only a question of time when we shall be able, in speaking of the magnificent historic fine-art of building, to make use of forms of expression which shall no longer loosely describe superficialities, the mere morphology of phenomena, but with scientific precision indicate the actual bases of principle and the causes and effects of fancy. The evolution or engenderment of architectural design, that is to say, must obviously, amongst the rest, become the subject of philosophic inquiry in its turn; and already we may be said to be waiting impatiently for the hour and the man.

The accomplished and eloquent President of the Royal Academy, in addressing the students some three or four weeks ago,\* accepted the occasion to offer a remarkably graceful and able statement suggestive of the line of argument which will be brought to bear upon the case when the time comes. "Art, in relation to Time, Place, and Race," was the title which Sir FREDERICK LEIGHTON adopted for his discourse; and it proved that his philosophical instinct was on the right track when he, although a painter, and a philosophical painter, found himself so much under the necessity of relying upon the architectural productions of the early ages of civilisation for the illustration of his argument. He could not help perceiving that, in the early youth of human culture, it was in magnificent building that the vigour of the artistic sentiment first discovered its powers; and when he called upon his audience to contrast the architectural remains of old Egypt and old Greece, as their first experiment in the discovery of the drift, if no more, of artistic evolution, he felt that, in their inception, all other systematic arts must own themselves to have been very small when architecture was very great, and to have been indeed things of the future when building, most colossal and most majestic, was already a thing of the past.

Sir FREDERICK LEIGHTON well said that it was impossible for him to overtake more than "a mere fragment" of his subject; we in our turn must acknowledge that we are equally unable to touch upon more than a mere fragment of his discourse. What he calls "Time, Place, and Race" covers more ground in philosophic prospect than we could attempt just now to indicate, if only in the language of speculation; and too many adventitious elements to be even vaguely catalogued in the space at our command, or, we are free to confess, by the knowledge at our disposal. But one incident that must have forcibly attracted the notice of most of the hearers and readers of the President's thoughtful lecture is so well worthy of further consideration, that even in this most cursory way we may take leave to dwell upon it as a singularly cogent illustration of the manner in which the mysterious sentiments of the mind of a people act directly upon the material aspect of their handiwork. We refer to the contrast which was so lightly touched, and yet so effectively defined, between the devotion of the Egyptian mind to the contemplation of the melancholy repose of death, and the occupation of the bright Hellenic intellect in the appreciation of the grace and vigour of life. It does not require any great effort of imagination to perceive how important the consequences of so radical a divergence of thought would be. Nor is it difficult to discern the corresponding difference between two equally prominent historical forms of intellectual development at a much later period of history, namely, the Christianity of the Middle Ages and the Scepticism of the Renaissance. If, as HERODOTUS records the fact, the Egyptians were "religious far beyond any other race of men," the Western Nations of Mediæval times, we may surely say, were religious beyond the Egyptians. And if in the time of ARISTOPHANES (it may have been but a pardonable artifice of rhetoric when PAUL THE APOSTLE reminded the Athenians a few generations afterwards that "in all things they were very devout") the bright Hellenes were as mercurial as their great precursors had been grave, we may very clearly see in the Italians of the Cinquecento period and the French of the whole modern time the same development of a broad and overwhelming reaction of human instinct, under the same law, although yet undiscovered, of artistic evolution.

But we must confine our attention in the present hasty observations to still narrower ground. To seek out the fundamental principles upon which a Titanic temple by the Nile and a little shrine on the Ilissus must necessarily differ, is more difficult than to observe how the "dim religious light," in other words the ineffable sepulchral serenity, of a Gothic cathedral, contrasts from first to last with the jubilant brilliancy of an Italian cortile. Shall we say that the constant contemplation of "death, and after death the judgment," was both the weft and the web of Mediæval art, and that even in this nineteenth century there is more than we suppose of our national artistic endeavour in England not yet emancipated from the old gloomy habitudes, and scarcely yet crossing the threshold of that entire joyousness of beauty which the old Greeks so delighted to cultivate?

The evolution or engenderment of Gothic architecture, as an example, might be a comparatively easy, if still a long, process to trace. The wreck of the Roman Empire, and the degradation of the Classic elements of both design and structure; the

\* See *The Architect* of December 15 ultimo, p. 368.

introduction of a somewhat effeminate form of Christianity, under the patronage of effete authority; the advent of northern barbarism in all its rude health of body and mind, and the corresponding change in faith and morals; the ascendancy of a vigorous and militant priesthood, the only agency by which the rampant spirit of violence and oppression could be resisted and overcome on behalf of mercy and justice; the universal domination, therefore, of religion, and the enforced allegiance of the whole mass of society to its principles of thought; the exaltation of the divine ideal to the uttermost, and of the aspirations of humanity when it followed the divine; and the whole of this rugged and yet grand drama, as it was performed, unconsciously, upon the stage of European history, unconsciously reflected in the mirror of building, generation after generation, with complete fidelity and unflinching force of expression. Then we do not forget, of course, to trace along the same line, step by step, the progress of the substantial, as distinguished from the social, elements of artistic cause and effect; and we find not only structural skill, but the application of materials and workmanship, at first declining to a low level, then struggling to recover, rising here and there with some success, in old forms and new; eventually acquiring a force and freedom of their own, and, like a strong man rejoicing as he runs a race, rejoicing in the sense of indomitable vitality and undaunted courage. So also, in the meantime, we can follow the development of the whole system of satellite arts which were now revolving around the master art of architecture; scarcely dependent upon it so much as lending it a thousand ancillary graces and playing about it with infinite joyousness. The influence of a strange and quaint traditional fraternity of workmanhood, most interesting to follow, is also said by some to have been such an element as we should have to admit into the sphere of inquiry; and there might doubtless be other considerations not to be quite overlooked, if the equivalency of components to resultants were to be rigorously insisted upon; but, throughout the entire philosophy of the matter, one thing that must account for much that would otherwise be indescribably characteristic is the radical peculiarity of thought to which we have alluded—the constant contemplation of something, not only not belonging to the surrounding world and the triumphs of life and sunshine, but throwing over all a glamour of the grave, and lauding to the skies the blessedness and the victory of death.

These suggestions, we are aware, do very slender justice to the breadth of inquiry and precision of detail which the expounder of principles would have to bring to the task of dealing effectually in the modern scientific spirit with the origin and progress of architecture; and perhaps there is no other historical period of development which would be so easy to handle as the one we have reviewed. But one observation which may at any rate be made is this—that the evolution of architecture is manifestly a process of exceedingly slow pace, the result of incidents which move slowly because of their very complexity and intricacy. The accepted history of the art, based upon its mere morphology or science of forms, in which superficial imitation is supposed to be the leading agent, and indeed an arbitrary and often capricious agent, only lies across the threshold of its true philosophy.

## A PUBLIC HEALTH EXHIBITION.

BY PROFESSOR T. ROGER SMITH.

AN exhibition in which architecture and building will play an important part is announced to be held this summer at South Kensington. We refer to the International Health Exhibition, which is to occupy the buildings put up to house the Fisheries Exhibition of last summer, and which its promoters hope may attain something of the popularity of that fortunate venture. As an introduction to any further remarks on the proposed Health Exhibition itself, we may find it instructive to glance at the circumstances to which it owes its existence.

Among the minor events of the year just closed, by no means the least remarkable was the great and, to some extent, unexpected success of the Fisheries Exhibition. Of the many displays, national and international, which have been held during the era of exhibitions, as the last thirty years deserves to be called, only a small number have accomplished results equal to the hopes of their projectors; but among them the

Fisheries Exhibition must be counted. Indeed, it is not too much to say that both in extent and popularity the display at Kensington fairly astonished its promoters. Success in the case of an exhibition may be gauged by the number of visitors, by the amount of public attention attracted, or by the sum total of the receipts. From a higher standpoint the tests are the completeness with which the subject is illustrated, the number and excellence of the novelties brought to light, and the influence which may be exerted on the development of art, industry, or commerce; and unless good results of both classes be attained the success cannot be said to be complete.

There was a good deal in the nature of the pursuits illustrated and the objects exhibited at the Fisheries, as it was familiarly termed, to account for its attractiveness, not to say fascination, for the bulk of English visitors. All the inhabitants of our vast extent of coast were of course interested in that which forms one of the special occupations in their neighbourhoods, and in which not a few of themselves were engaged; while for all inland folk there was a kind of seaside savour about the whole affair which recalled associations of holiday time, boating, bathing, fishing, and shrimping, not to speak of the very many to whom angling is a favourite relaxation, and who found that was kindred to their pursuits at Kensington; all these went prepared to be pleased, and found in the exhibition that their anticipations were not disappointed. The material objects were many of them picturesque, all of them characteristic, and as nets and boats, oars and paddles, rods and lines are all in their very nature eminently movable, they were brought together with ease in great quantities, and were to be seen in a perfectly natural arrangement.

These elements of popularity might, however, not have sufficed to secure this brilliant result, had not the architectural distribution of the *locale* been favourable. The architect and his work are of far more importance than the world—or, at any rate, the English world—is willing to admit; and, in almost every public undertaking the intelligence with which the building has been planned, or the reverse, has quite as much to do with success or failure as any of the more obvious considerations of the case.

Rather more than ten years ago exhibitions intended to be annual were begun at this very spot in South Kensington with very good prospects of success, and with the double advantage that it was proposed to unite fine art with technical. Considerable expense was gone to in the erection of galleries, and infinite pains were taken by experienced persons; but the scheme, though launched seemingly with every chance of prosperity, languished for two seasons or so and died a natural death. To nothing was this failure more directly traceable than to an architectural blunder. Sir HENRY COLE, astute though he was, and himself the child of the most successful exhibition of the century, committed the blunder, unpardonable in a man of his sagacity, of causing the galleries to be arranged round a great open space, but not opening on to it, so that nowhere could the visitors congregate. The wonder of 1851 had been the vast crowd pacing up and down the nave of that first Crystal Palace; and the real magnet which drew the multitude to Hyde Park was this very changing kaleidoscope of humanity which they crowded to gaze at, and to which each spectator unconsciously contributed a fragment. So it has been in every successful exhibition since, and the many who care more for relaxation, recreation, or excitement than for study or research, ceased to frequent Sir HENRY'S galleries as soon as they found that, though they could see the objects exhibited admirably, they saw little or nothing of one another.

From this drawback the Fisheries Exhibition was free, and though it was held in what was not much more than a series of well-built sheds, there was a capital promenade under cover, and there was a further attraction such as has not been to be had in London for many a day—a garden illuminated and provided with chairs and bands of music, and offering on those evenings when our uncertain climate permitted such amusements, an *al fresco* lounge that recalled something of the cheerful sociability of French or Italian cities.

It is now desired to take advantage of this fresh departure, and a short series of subjects, at once popular and important, has been arranged. First on the list stands public health, and this is to be illustrated in the present year. Public health does not mean simply drainage, and of this the framers of the programme seem to be aware, for though a very large number of subjects connected with what is commonly called

sanitation are mentioned, others are included which belong to hygiene, considered in its broadest and truest sense, as the source of healthy human life. As much of our life, especially much of modern life, is spent in buildings, the influence of the building upon those who inhabit it, work in it, or are taught and teach in it, has rightly been included, though probably hardly so much prominence has been given to it as its paramount importance merits. The truth is that almost the whole course of our sanitary efforts hitherto has been unavoidably devoted to extricating ourselves from the disastrous consequences of a gigantic blunder. We suddenly found that modern house-drainage, as practised all but universally, was leading to deadly and fatal results, and we had first to learn what was wrong and how to right it, and then to attempt, with as yet only very partial success, to rouse public attention. But all this is only negative. A house is not necessarily healthy because there are no foul smells, and the elements from which its human occupants draw their supplies of vigour and cheerfulness are not the absence of nuisances but the presence of light, warmth, dryness, cheerfulness, comfort, and fresh air.

If the exhibition can but succeed in giving some, even the faintest echo, of the brightness of spirit enjoyed by those who are in circumstances thoroughly conducive to health, it would gain an attractive charm, far more powerful even than the sense of the picturesque, and the faint touch of something akin to romance, which we have alluded to as attaching to the display of last year. We do not see that this is too much to aim at ; but in order to reach it the architectural side of the science of health must receive its full share of attention.

Six divisions have been announced. They comprise—1, food ; 2, dress ; 3, the dwelling-house ; 4, the school ; 5, the workshop ; and 6, educational appliances. Dress and food may probably prove the most attractive parts of the display ; but our readers will be more concerned with the house, the workshop, and the school, and we trust that the undoubted advance which has taken place in this country within the last quarter of a century in buildings for habitation, for manufacture, and for education, will be clearly made manifest, and that pains will be taken to show how so complex a problem as making a dwelling-house, a factory, or a school as healthy as it can be, should be attacked, and has been, in fact, successfully dealt with. The healthiness of a building depends upon its whole architectural treatment, the choice of site, the aspect of the different rooms, sufficient window space, sufficient air space, good ventilation, freedom from draughts, damp and smoke, and even dust. The appearance contributes its share to the beneficial effect which a thoroughly good building exerts on the health of its inmates. In a house by WATERHOUSE, or a school by ROBSON, or an institution by SAXON SNELL, all these influences are combined, as far as the circumstances of the case permit, for the good of those who are to occupy the building, and it is this co-operation of architecture with hygiene which we would gladly see illustrated.

Of course all these qualities can only be perfectly appreciated in the actual building, and buildings, even the smallest, cannot be taken to Kensington as boats and nets could, nor can they be erected there to any great extent ; but in the plans of structures provision is made for every one of them, and in good plans or models well shown the science of healthy building not only is embodied, but can be to a considerable extent exhibited.

It might even be possible to point out in some way the excellency of the plans which are adjudged fit to be presented, in sufficient detail to enable the public to judge why from a health point of view they were judged fit for distinction ; and should this be attempted, and properly carried out, it will prove eminently instructive, not only to the general public, but to architects themselves, and to those caterers for public accommodation who create the dwelling-houses not only of the million but even of the "Upper Ten."

We shall watch with no small interest the development given by the Commissioners appointed by the Prince of WALES, and headed by him, to this part of their proposals. It is a matter of regret that while there are no fewer than four medical men, there is no architect and no engineer on the Commission ; but this omission may perhaps not prove so detrimental to the object we believe to be one of the most important of those which the exhibition contemplates—the demonstration of the influences which the architectural design of buildings exerts on those who occupy them, and the way in

which every part of a building, and the structure as a whole, should be so framed as to promote their health. Physicians are quite as much alive to this as any other class of observers, perhaps more so, and they know better than many other people that such influences as these, though they have been too often overlooked or ignored, are of primary importance to individual and public health.

## FIFTY YEARS AGO.

ONE man alone in England is competent to draw a contrast between the condition of architecture fifty years ago and to-day. Need we say it is the NESTOR of the profession, Emeritus Professor DONALDSON? He has, like the Greek hero, "so long walked hand in hand with time," that he could go back in recollection for even another decade. Sixty years since Professor DONALDSON had acquired a reputation. His design for a Temple of Victory was exhibited in the old Royal Academy at Somerset House. Before that time it had gained for its author the honour of admission to the Roman Academy of St. Luke, and as if to testify that a work of art is, like CLEOPATRA, unaffected by time, it was very lately engraved in a French periodical. It seems like going back to the Heroic Age when one finds that in the same exhibition were the design for BARRY's first commission, his church at Brighton, besides some of his Egyptian sketches the restoration of the Erechtheum by INWOOD, the drawings of the Bank of England by SOANE, the Cambridge College by WILKINS, a dream of Ancient Athens by COCKERELL (who was then without substantial commissions), and rustic lodges by JEFFERY WYATT, known afterwards as Sir JEFFERY WYATVILLE. If Professor DONALDSON would recall his recollections, what a delightful book would be produced, and one, too, without a fellow in English literature ! We have no intention in the limited space assigned to us to attempt any ambitious comparison between the two periods. Our desire is simply to take from the records a few circumstances which may suggest the state of the profession in 1834, just as a cross section here and there often serves to explain a line of country.

There is nothing more difficult than to describe the condition of architecture at any time in a few words. It is like commenting on "things in general" in a sentence. In 1834 there would be no difficulty in obtaining in London as fine a design for a building as could be then obtained in any city in Europe. BARRY had shown of what he was capable by his Travellers' Club House, COCKERELL by his chapel in Regent Street, HARDWICK by his Euston Station and Goldsmiths' Hall, WILKINS by his University College, and among the young men who were looking out for an opportunity there was HARRY ELMES, who in a year or two afterwards carried off the St. George's Hall prize, which COCKERELL was proud to complete. But with all this available ability there was a tendency in the English public to gratify themselves by patronising commonplace architecture both in private houses and in public buildings. It was supposed that nothing could be so "respectable" as cement, and not only were houses built with drab fronts, but fine old red brick houses were coated with that dismal material. A representative man of that time was Mr. McCULLOCH, the political economist (CARLYLE'S "McCrowdy"), and the only occasion when he appeared to be enthusiastic was when he was eulogising cement. It was to his mind as splendid a result of economic science as shoddy, adulteration or other shams. By means of stucco he said the finest freestone could be so closely imitated as to make detection most difficult ; it could be applied to an inferior class of houses, and it permitted an elaborateness of ornament that could not be executed in stone at many times the cost. On public grounds it was no less advantageous, for, as he said, "this method of dressing-up houses has contributed most materially to the improved appearance of the town." A political economist—especially when he holds a lucrative office—always appears to live in the best possible world, and to Mr. McCULLOCH those parts of London which owe most of their elegance to the judicious application of "stucco," were magnificent and incomparable. It is, however, an advantage sometimes to see ourselves as others see us ; and this was possible in 1834, for the Baron D'HAUSSEZ, who was one of the Ministers of CHARLES X., visited this country in 1833 and gave his opinion in print upon what he saw. He was not delighted with English painting or

music, but the architecture, he considered, was worst of all. Building, he said, was reduced to routine—brick was piled on brick, and there was no thought of order or symmetry. Columns were the substitute for ornament. They were placed on cornices and balconies, on shops, palaces, and cottages, and with as much utility in one place as in another. The architect's duty ended when the walls were constructed, and the rooms divided by longitudinal and horizontal partitions. Then came the upholsterer and decorator, who covered the walls with red paper, and introduced furniture and carpets to correspond. In a word, the Baron came to the conclusion that although the English could build towns they were unable to build houses. To what extent was the critic right? The answer will be best suggested if we first consider the state of professional education in those days. One often hears it said that there must be fewer opportunities now than formerly for the attainment of knowledge in architects' offices, and on the other hand it is affirmed that long ago every pupil was a model youth who was eager to acquire practical knowledge, and when his term was expired, he was fit to undertake any kind of building. How pupils were taught fifty years ago can be seen from a remarkable letter which was addressed by a Mr. BELL, an architect, to Sir JOHN SOANE. One extract will suffice:—

In other professions the path is so clearly chalked out, and the studies so well defined for the student, and his *status* so fully acknowledged when he has passed his examinations, that he is at least free from the annoyance of competing with those who have not gone through the same ordeal with himself. But in architecture, when the student becomes one-and-twenty, he suddenly finds himself freed from an office where he has been toiling three, five, or seven years, learning the mechanism but not the principles of his profession, with all his deficiencies staring him in the face, at the very moment when he is most in need of self-confidence. It is possible, though not probable, that there may be a few who, diligently devoting the hours generally allotted to pleasure or rest, may, during their apprenticeship, learn a little of the theory of construction, and something of the history of their art. But their ideas on practical utility, without the advantage of demonstration, must be crude and uncertain; and with regard to the less tangible properties of beauty and proportion, books are not the best masters, since there are too many of them in which contrary theories are upheld, and none in which essential qualities are firmly established. Yet, admitting that the apprentice, during his minority, has taken full advantage of his leisure moments, and learned more without than within his office, still his acquirements are not such as would enable him to pass an examination with credit either to himself or his master. The truth is, that the master (generally speaking) has no interest in his pupil, except in so far as regards his own convenience; and as that can be best attended to by making him one of the instruments of the case he has just taught him to handle, instead of teaching him how to think, he inculcates passive activity. That this must continue to be so, as long as the present system holds, I do not doubt; and consequently many minds of naturally noble germ be crushed by this contracted mode of education. But besides the practical routine of an office, other professions have their schools, their colleges, their able professors—their honours and acknowledged rights. Architecture alone, that which of all others requires the most extensive acquaintance with general principles of science and art, has no schools, and no laws for its government and protection; so that the title of architect being open to all, it has been assumed by every description of persons, from the veriest hedge-carpenter to the most superficial antiquarian charlatan. When these things are considered, it is surprising that more monstrosities have not appeared, and more disastrous accidents not occurred.

The length of this quotation will, we hope, be justified by its interest. It is not unlike many a speech and letter of our time, but the remarkable fact is that although fifty years have elapsed, the public continue to be indifferent to the process by which an architect acquires his title to practice, and it is still possible to appear in borrowed plumes without inconvenience to the wearer. Mr. BELL, with the world before him, was dissatisfied with the profession. Sir JOHN SOANE, who had gained fame and fortune, was of the same mind when he looked back upon his fifty years' practice. In the "Memoirs" which he had privately printed in 1834, there is a strange passage which suggests that Sir JOHN regretted his adherence to the profession, and that in his old age he believed he could have found some other more worthy of his powers:—

Though I have briefly alluded to those intellectual delights and mental gratifications which the architect feels whilst perpetuating in his labours the charms of his chaste and beautiful damsels, yet I have likewise detailed many of those serious mortifications and disappointments that have induced not only the present Master of

the Rolls, but many other highly-talented artists, to retire from the practice of this noble and useful art, after having devoted years of study to acquire a competent knowledge of its theory and practice. Nor will it be matter of surprise if the student in architecture, after glancing over the preceding pages, should be discouraged from the pursuit of his studies, and leave the practice of the profession to the ignorant mechanic, the deceptive contractor, the speculative builder and the fanciful draughtsman.

This passage may have been due to private, rather than professional wrongs, for at that time Sir JOHN was smarting under filial ingratitude, and he had been charged with squandering his money "in the ostentatious gratification of pride and vanity," while his nearest relatives were in a state of pauperism. But it may also have been the outcome of his indignation at the success of some of his incompetent contemporaries. It was hard to see WILKINS preferred before him, but to know that in the Court and in public offices JOHN NASH was considered to be a greater artist than JOHN SOANE, was more than human nature could be expected to bear. His remedy for architectural evils was the adoption of limited competitions, and for all we know it may have been SOANE'S suggestion which influenced the authorities the following year, when it became necessary to procure designs for the new Houses of Parliament. Of one thing Sir JOHN was convinced, namely, that if there had been a competition, the King's palace would have stood on Constitution Hill as he proposed, and that his design must have been accepted. "If this course had been followed," he wrote, "instead of that monstrosity at Pimlico yclept Buckingham Palace, raised to the disgrace of the nation, at an enormous expense, on a swamp surrounded with nuisances of a most disgusting character, we might have seen a royal palace erected on that elevated and salubrious spot, Constitution Hill." In those days writers and speakers were more outspoken than they are now.

Sir JOHN SOANE'S name was the most prominent in the profession at the beginning of 1834. In February he delivered his last lecture at the Royal Academy, and his friends then proposed that a medal should be struck as a memorial of his honourable professional practice, and his liberality in presenting his collections to the nation. Among the members of the committee were BARRY, ANGELL, GEORGE BARCLAY, CHARLES FOWLER, GOLDCUTT, RHODES, ROBINSON, KENDALL, DONTORN, JOSEPH KAY, and THOMAS LEVERTON DONALDSON, all of whom were enrolled on the earliest list of Fellows of the Institute of Architects. The medal (or rather medals, for there were copies in gold, silver, and bronze) was presented to Sir JOHN SOANE in March 1835, with an address which was written by Professor DONALDSON. In the course of Sir JOHN'S reply (which was read by a friend) he referred to the sunbeams and shadows which cross an architect's career, the shadows being "the dissatisfaction which sometimes arises from his zealous opposition to the fancies of his employer, or from the perversion of his own well considered designs in forced submission to the false taste of some influential patron." It was also announced that in commemoration of the event the sum of 150*l.* was to be annually distributed at the Museum among distressed architects, their widows and children. Sir JOHN SOANE also gave 750*l.* to the new Institute of Architects.

The foundation of the Institute was, we may note, another incident of the year 1834. As far back as 1806 there was a "London Architectural Society," but it was not long lived. A second Architectural Society was founded in October 1831. The members ventured on having a *conversazione* on January 21, 1834, in Exeter Hall, and no less than two hundred and fifty people were invited by the president, Mr. W. B. CLARKE. There was a mosaic slab at the entrance of the rooms inscribed *Salve*, on which the visitor was made to tread. The President's pavilion was hung with red drapery, there were architectural drawings, sketches, paintings, &c., to be seen. It was explained by the President that the object of the Society was to establish a British School of Architecture, with a library, museum, professorship, and exhibitions, and to seek a charter in order that the profession might be preserved from uneducated, incompetent intruders, who did not scruple to snatch business from men who had gained their knowledge by hard study and at great expense. In the same month a meeting was held in the Freemasons' Tavern to form another Society; but all who were present were unable to agree. A special meeting was afterwards held at the Craven Hotel, and to it may be traced the foundation of the Society which is known as the Royal Institute of British Architects. The first general meeting was held in June

1835, at the rooms of the Society in "Evans's," near Covent Garden Market, under the presidency of EARL DE GREY. The vice-presidents were CHARLES BARRY, J. B. PAPWORTH, and P. F. ROBINSON; the secretaries, T. L. DONALDSON and CHARLES FOWLER; and the ordinary members of council, J. GOLDCUTT, H. E. KENDALL, GEORGE MOORE, JOHN NEWMAN, HENRY RHODES, G. L. TAYLOR, and ROBERT WALLACE. Among the honorary members were JOHN BRITTON, Dr. WHEWELL, and Professor WILLIS.

On looking over the list of members, one is struck by the preponderance of names associated with the style that was called Classic. SCOLDS and BLORE stood almost alone in representing Gothic among the Fellows. But an event occurred on the night of October 16, which exercised the greatest influence on the architecture of the following years, and for a time made Gothic paramount. Orders had been given that the Exchequer "tallies" should be burnt in the stoves of the House of Lords. The flues were either dirty or defective, and in consequence the Houses of Parliament were destroyed by fire. If it were not for the exertions of Lord MUNSTER and Mr. WESTMACOTT, the sculptor, Westminster Hall would have shared the fate of the adjoining buildings. It was announced that the design for the new Houses of Parliament was to be selected in a competition, and that Mr. HANBURY TRACEY, Sir EDWARD CUST, the Honble. T. LIDDELL, Mr. GEORGE VIVIAN, and Mr. SAMUEL ROGERS, the poet, had been appointed Commissioners to examine and report upon the plans. What followed is known to the youngest pupil of the present day. CHARLES BARRY'S design was selected, and Gothic became the popular style. The mind of the public had been prepared for the adoption of it by the romances of WALTER SCOTT, and we may also note that the "Tracts for the Times," which afterwards had much to do with the substitution of Gothic for Italian and Classic churches, were at this time beginning to attract attention in Oxford.

The year 1834 might be taken as marking the close of an era that had long been moribund. In the next year we find signs that would at one time be thought revolutionary. Attention was for the first time given to the connection between art and manufacture, and a Parliamentary Commission was actually appointed to investigate the subject. To many people it must have been as sure a sign of the downfall of England as the passing of the Reform Bill. But the inquiry opened the eyes of the public for the first time to the necessity of fostering design, and to it may be traced the existence of the Science and Art Department, with its schools, museums, and exhibitions. From what we have said we think it will be evident that since 1834 there has been progression, and in spite of the existing depression may it not be anticipated that in the ensuing half century the rate of progress will not be diminished?

### BUILDERS' GRIEVANCES.

BY STANLEY G. BIRD.

IN taking a retrospective view of the condition of the building trade for the past year, I am afraid it must be admitted that it has been as bad as it possibly could be. Look where one will in the City, large and expensive blocks of offices and warehouses are unlet, and in the suburbs long streets and terraces of houses are tenantless. The signals of distress, "To be let or sold," show, without doubt, that building in London is overdone. This, I regret to say, is also the case in the country. The fact is evidenced by many of the important buildings in London, public and otherwise, during the past two years having been contracted for and erected by provincial builders, many of whom have opened offices in London. This is a serious consideration, and the question naturally arises as to the cause of these firms being able to compete successfully against London builders on their own ground. The answer will probably be apparent to anyone giving the matter a moment's thought. The quarterly register of the state of trade throughout the United Kingdom shows that everywhere alike it is "slack." If confirmation of this were required, reference to the returns of failures would show that the building trade, in proportion to their number, still holds the unenviable position of heading the list. It is a sad reflection, and shows there is a screw seriously loose somewhere, when we find that so many large buildings, the erection of which should have brought honour and profit to the builders, have only resulted in their collapse or ruin.

Much prominence has been given of late by the press to the unsatisfactory condition of houses built in recent times. No doubt this may be true, and is of some ; but it must be remembered that there are "builders" and "builders." It is to the jerry builders that the newspapers refer, and I am sorry that the facts are too strong for contradiction. There can be no doubt that the late depression is responsible in a great measure for this state of things. When a panic occurs people are frightened, and naturally rush to their lawyer for advice, and he suggests a mortgage as a safe investment. The lawyer inquires of a surveyor, who is on the look-out for business, and seeing houses in the suburbs, being run up by a builder, informs him that he can obtain advances for him if required. Frequently the builder has half a dozen other offers of the same kind, and is obliged to decline ; but he has "a friend" who is about to make a start. This friend is probably a journeyman, without a farthing in the world to lose, but everything to gain. By this means hundreds of "jerry builders" or "field-rangers" are created annually. One is led to wonder how these men obtain credit, but when it is seen that merchants are willing and anxious to supply materials on any terms, and when, too, timber merchants offer such facilities as taking bills at six months and then renewing them, one need not be surprised that before the bills come to maturity the builder has vanished, leaving the mortgagee in possession of a questionable security. Occasionally one of these speculating builders blossoms into a contractor. It will be conceded that no trade requires so much general knowledge and such training as that of a contractor ; yet many of these men, with scarce any qualification, go into it with a light heart, often calling in the aid of a local surveyor, who combines the calling of auctioneer, house, coal, and insurance agent with that of the profession of architect. This gentleman makes up the estimates, and being anxious to show his efficiency gets him a few jobs. The result is not often long in showing itself. I have been assured by many friends that much of the work taken during the last year has been at ten and even twenty per cent. under prime cost. This state of things, this keen competition, cannot last, and I trust in the year which is just beginning many will see the folly of continuing it, and will give it up before it gives them up. Things certainly cannot be worse, but let us hope that 1884 may be better and more prosperous, although it does not seem to open brightly, for I am told on all sides that comparatively few prospective works are in contemplation. I do not mean railway or public contracts—though that business, too, is bad—but smaller and the more ordinary building works, which must always form the staple food for the rank and file of the building trade. It has been noticed lately by builders, and doubtless also by surveyors, that in the last few months there has been a great dearth of quantities, and I am told that instead of there being half a dozen or more sets in their office, for which tenders are required, two sets are seldom in at one time.

During this year the Royal Institute of British Architects will celebrate its jubilee, while the builders hope to inaugurate the incorporation of their Institute—perhaps some day it may boast too of the proud title of Royal. I have always felt the necessity for some permanent institution similar to the Royal Institute, and being still more anxious for the well-being and the improvement of the trade, have been at work for some years to this end ; and I am glad to say that I think there is now every prospect of success. I trust the day is not far distant when every one will have to pass an examination and obtain a diploma of fitness before he shall be permitted to call himself a builder.

During the present year it is hoped to obtain a conference with the Royal Institute on several matters of vital importance to the community generally, but to builders in particular. One of these matters is the "quantity question." At a meeting of the National Association of Master Builders of Great Britain, held last summer, the following resolutions were passed, viz. :—

1. That quantities should be taken out by competent surveyors.
2. That quantities should be taken out by responsible surveyors.
3. That quantities should be signed by the surveyor.
4. That quantities should form part of the contract.
5. That it be recommended that the Institute should give some diploma of fitness of surveyors to take out quantities

fairly and properly, somewhat similar to the system established in Scotland of "ordained surveyor."

6. That the Royal Institute and the National Association agree upon a fair form of tender.

7. That the Royal Institute be asked to consider certain amendments to the form of contract; among these an alteration to be made so as to make the quantities part of the contract. Also to provide for extra work being paid for during the progress of the works. Also as to the costs of award, and that an award in arbitration shall be made within a reasonable time, and that no enlargement of time shall be allowed without the written consent of both parties.

I have had some correspondence with Mr. WHITE, the Institute secretary, on the subject, and I believe there is every prospect of a meeting being arranged during the summer. These are matters of the utmost importance to us, and I shall be very glad if, in the meantime, builders and architects will give me the benefit of their experience and advice, so that I may be prepared to fully lay the matter before the Royal Institute.

In addition to the many difficulties which builders have laboured under for some years, an increase in responsibility has now been thrown on them by the introduction of the Employers' Liability Act, and the trade has now established the Builders' Accident Insurance, Limited, to protect themselves against accidents to their workmen.

### SIR JOSHUA REYNOLDS AT THE GROSVENOR GALLERY.

THE popularity of the art of REYNOLDS has never been put to so crucial a test as it now runs in the Winter Exhibition of the Grosvenor Gallery. More than two hundred portraits and fancy pieces fill all the available space, and repeat with a variety in monotony the types and fashions of the painter's time, his moods and mannerisms; appealing, moreover, not as little-known or seldom-seen pictures, but with familiar faces, from frequent public exhibition or presence in English homes.

Everything conduces to this popularity of REYNOLDS. About the life and character of few artists do we know so much or so pleasantly. He is the genial centre figure of a genial circle; brilliant gossip scintillates around him and the varied throng of dames and lordlings, wits, statesmen and philosophers, fair ladies of dubious fame and indisputable charms, or children innocent as the newly-opened daisy, who, under the easy favour of the artist, were welcome to seek immortality at his easel. We read his diary and know all about his strenuous industry, his ambitious efforts to excel and discover and experimentalise; we discern well enough the kind heart and shrewd sense to which his friends high and low alike testified. Further, the portrait art of REYNOLDS is winning by reason of a combination that is quite individual, a fine taste that is close upon the creative, a perception of character that is nearly insight, a grace that approaches the ideal, united to a lovable, almost homely, simplicity, and a use of the dear familiar looks and ways of family life. This union is of course found most distinctly in the pictures of mothers with their children, such as *The Duchess of Devonshire and her Child*; *Lavinia, Countess Spencer, and Viscount Althorp*; *Mrs. Hartley and her Child*, three portrait groups which, for tenderness and grace of motherhood, set forth with pictorial style, cannot be surpassed within the circle of actual, not ideal, art. After these subjects come the single studies of children, the freakish darlings with their pet animals—little *Miss Cholmondely* crossing a stream and hugging her dog with such deliciously anxious effort; *Muscipula*, with her mouse-trap; *Felina*, with her cat; and that lovely figure of little *Master Philip Yorke*, with the robin on his shoulder and the dog looking up in his face, which will be new to many visitors to the Grosvenor Gallery. For perfect rapport between the child and his bird and the dog, for spontaneous grace of pose in the set of the boy's figure, outstretched arms, and bent curly head, this slightly-finished piece (the hands are more suggested than painted) is one of the most perfect specimens of REYNOLDS' child-pictures. To the company must be added *Lady Fitz Patrick*, a tiptoe on the hill-top, dainty as if dropped from

the skies, and *The Hon. Francis Harris with a Dog*, a charming composition but in very bad condition.

Perhaps in no quality did REYNOLDS show his artistic nature more than in the relation between his treatment of a subject and the subject itself, apart, that is, from his abominable experiments with varnishes and pigments, for which he is no doubt repentant in some artists' limbo at this moment. It were not too much to say that instinctively he seems to have felt his way to the touch and style which best befitted the age and character of the person before him.

His faulty or careless drawing, his generalised draperies, the lack of substance and distinct articulation of form that may be honestly admitted as too frequent—these imperfections or positive faults are incident to every class of subject which he treated. His technique, moreover, was influenced by the restless experimentalising spoken of before, and by the sway of the master whose method for the moment he sought to emulate—TITIAN or RUBENS or VANDYCK. But, taking all these matters into account, there remains a fine correspondence between matter and manner, to put the case roughly, which is notable and distinctive. Compare, for example, the child pictures named above with the portraits of *Elizabeth Gunning, Duchess of Hamilton, The Hon. Mrs. Beckford, The Countess of Mexborough*, and pictures of that sumptuous class, or with the simpler but still elegant *Lady Henrietta Herbert* in a dark hat; *Lady Anne Bingham*; *Lady Caroline Keppel*; *Lavinia Bingham, Countess Spencer*; *The Young Lady*, niece of BURKE's lawyer; or with *Mrs. Nesbitt as Circe*, or *Mrs. Collier as Celia lamenting*, or with the deliberate, smooth, and solid *William Augustus, Duke of Cumberland*, with his portly person wrapped in robes of the Garter, or the VANDYCK-like study of *George John, Viscount Althorp*, at seventeen, or the incisive and carefully-modelled bust-portrait of *Joseph Baretti*, or the precise *Warren Hastings*, or the glowing face of *Richard Burke*, or the *David Garrick* and other studies of facial expression. Then the nude figures painted in emulation of TITIAN, forced up with melting golden varnish and strong *chiaroscuro*, and the grandiose portraits, such as the famous *Mrs. Siddons as the Tragic Muse*—they all have their especial and appropriate mode.

This collection at the Grosvenor Gallery is, on the whole, as complete as need be, with the exception of important allegorical pictures such as the *Virtues* for the New College windows, and dramatic efforts like the *Ugolino*. The gathering is thoroughly representative. Canon FURSE and Dr. HAMILTON have lent black-and-white sketches, interesting as first notes of composition. Among the pictures exhibited can be traced the repetition of attitude or arrangement of detail which is often made at request of sitters, by a popular portrait painter, or from his own favourite fancy. The student of method, too, has ample field for curious investigation in following the phases of REYNOLDS's technique, especially where cleaners have not been allowed to skin a picture alive, as in the lamentable case of the famous *Mrs. Pelham Feeding Chickens*. We may freely grant all the shortcomings, groan over crackled varnishes and decomposing carnations, slovenly drawing and characterless drapery, with what other indictments may be made against our genial English master; but for all that we "shall never look upon his like again."

### THE PRIORY OF THE HOLY TRINITY, DUBLIN.

By THOMAS DREW, R.H.A.

FOR many years the site and plan of the cloister garth and the surrounding monastic buildings, which must once have been a part of the Priory of the Holy Trinity (now known as Christ Church Cathedral), Dublin, have been a matter of curious speculation to me. The church alone has survived to our time. I knew it all before Mr. Henry Roe's great restoration. Every detail of that restoration, with its marvellously interesting revelations of the church's former plan, was familiar to me, as all the church is now. I had read all that is known to be recorded of it, but without meeting the slenderest clue to the history or existence of the former subsidiary buildings of the monastic establishment.

By Mr. George Edmund Street, R.A.—to whose marvellous instinct for the comparative anatomy, as I may term it, of a

Mediaeval building and profound architectural erudition we owe the re-creation of this perfect and unique twelfth and thirteenth century church from merest shreds of evidence—the site or plan of the monastic buildings was untraced or uninvestigated. I know this from the interesting account of the restoration penned by this great architect himself, and left unpublished at his death, the proofs of which, before its publication, it was my privilege to revise. It has been a matter of great interest to me—following, *longo intervallo* indeed, so great a master in the care of the cathedral—to alight upon some threads of evidence not only to identify the site of the monastic buildings, but to trace their plan with a bold hand, leaving but little conjectural of what goes to fill in the outlines.

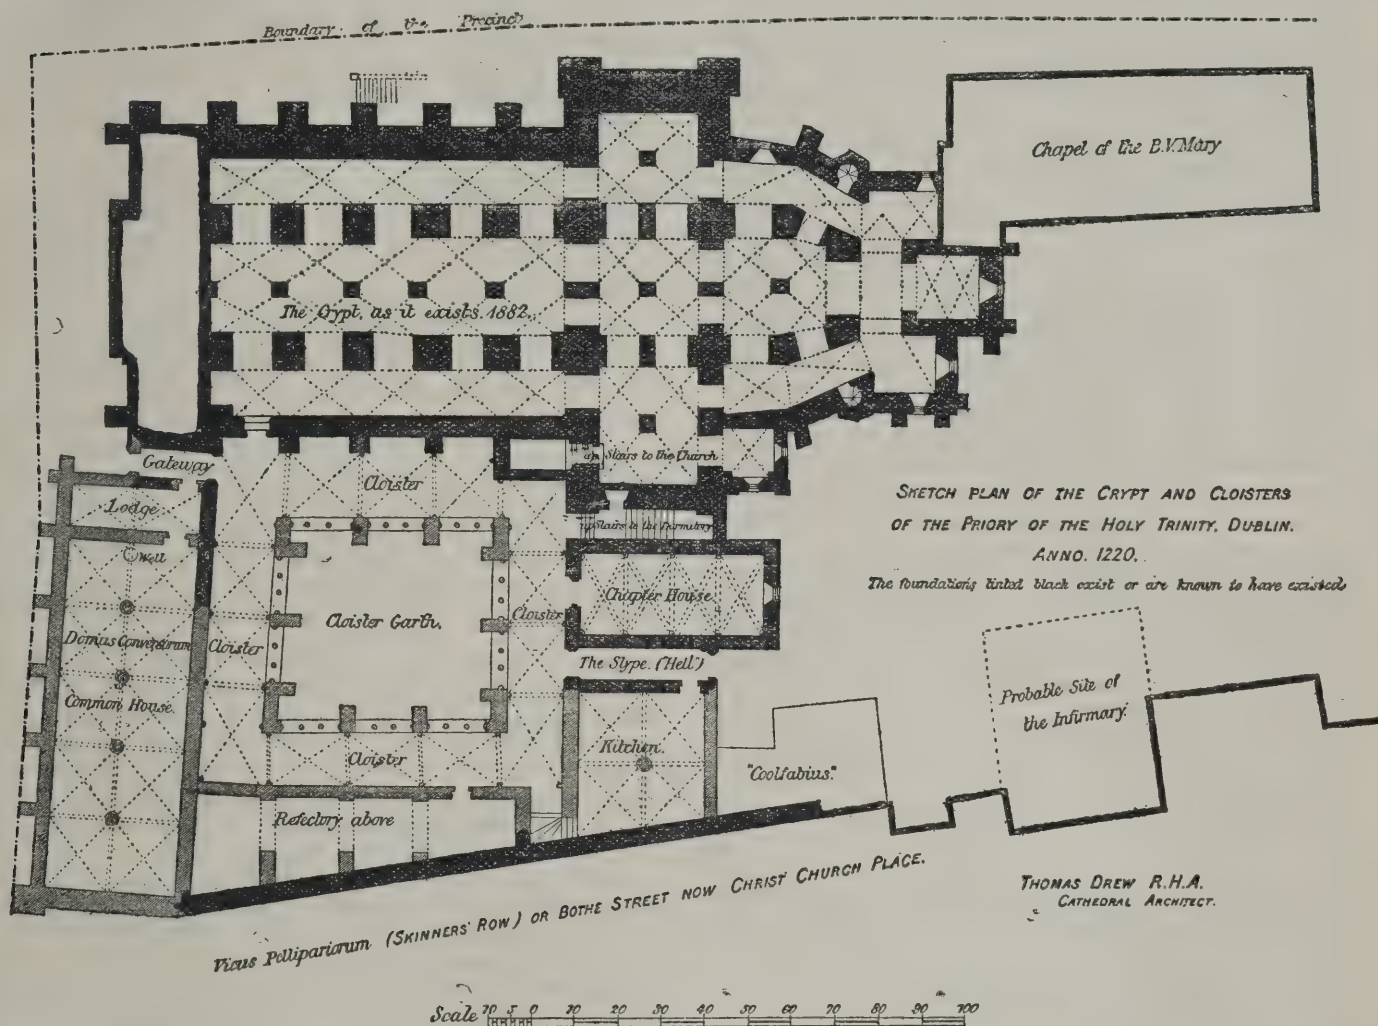

I have long looked for even a hint to aid speculation as to whether the cloisters stood upon the north or south side of the church, as they indifferently do in the monastic plan. I inclined to surmise on the north, as nothing more unlikely than the south side as it exists (a steep declivity between Christchurch Place and the cathedral), as a site for the level of a cloister garth, could have

the chambers over it. I have no doubt they are those very ones offered by an advertisement in a Dublin paper of that time—

To let, apartments in Hell.  
N.B.—Well suited to a Lawyer.

Further information as to the “Exchange” was given me from a map, the accuracy and authenticity of which I cannot well doubt from its internal evidence, although the sources from which it may have been compiled are a mystery.

Bound up in Kelly's new (and uncompleted) edition of Archdall's “*Monasticon Hibernicum*,” vol. ii., is a map of Christ Church Cathedral and precinct, evidently not drawn for this work. The text has no reference to it, and the reference figures on it are sought for in the body of the work in vain as having any meaning. I have, however, ascertained that this map was intended for a work by William Monck Mason, never published. It would appear that his well-known history of St. Patrick's Cathedral was not intended to be a monograph, but the first instalment of a great

suggested itself. I had scarcely entertained a thought of looking for anything so improbable. However, there is preserved in the cathedral, by some happy chance, a comparatively modern document—a map and survey of the cathedral property, with a schedule, prepared by one John Sedding in 1761. It shows the old Four Courts, and the passage then colloquially known as “Hell,” the Exchange, and, as the schedule quaintly sets forth among other things, “the place where the stocks is;” \* it delineates the many houses and small tenement holdings in Skinner Row, now swept away, and the two “yards” surrounded by shops and small booths intervening between these and the south side of the cathedral.

Looking at Sedding's map, the last thing that would strike most people would be to develop the plan of a monastery out of it. Views of the cathedral from the south-east, given by Grose in 1791, and drawn as late as 1821 by George Petrie, give a rude notion of what the “Exchange” was. It is at once recognisable as a Mediaeval groined building, and Sedding's schedule sets forth

and ambitious work, “*Hibernia Antiqua et Hodierna*, being a Topographical Account of Ireland, and a History of all the Establishments in that Kingdom, Ecclesiastical, Civil, and Monastick.” I have the prospectus of the volume relating to Christ Church projected in 1819. This projected volume never saw the light, and the MSS. and raw material collected for it found their way to what is known as the Phillips collection, locked up from scholars at Cheltenham. The steel plates intended for it were sold at an auction in London, bought by Mr. Kelly, and inserted *passim* in his new “*Monasticon Hibernicum*,” to adorn the work, merely. Mason's map gives the Exchange as a four-bayed groined building.

It scarcely needs a glance from anyone acquainted with the typical monastic plan and its varieties to recognise this building as the ancient Chapter-house in its usual and expected place with reference to the church. It stands east and west, about seven feet away from the south transept, and the views above referred to show us the monks' dormitories over it. The passage that intervenes between the Chapter-house and transept in Sedding's map gives, where one would look for it, the staircase by which the

\* The stocks are still preserved in the cathedral.

monks passed from their dormitories to the church. Knowing that the south transept had been greatly altered in 1831, when the old door, brought from the north side, was inserted in the middle of it, I looked for a trace of the monks' door where it should be, and then found it plainly indicated by the built-in masonry to the left of the present doorway. Here were clues, absolutely determined, to point to the existence of cloisters on the south side.

To the south of the Chapter-house, in most monastic plans, one looks for the passage called the "slype." Here it is found clearly defined in the old plans, remembered by some still living citizens, and familiarly known by the more modern name of "Hell," even so far away as to Robert Burns. The lines have been often quoted :—

But this that I am gaun to tell,  
Which lately in a night befel,  
Is just as true as deil's in hell  
Or Dublin city.

We know that next to the "slype" would come the kitchen, or "calefactory," the day-room of the monks, its limits only wanting to be defined, and which Sedding's map supplies when studied.

This would have been all to be derived from Sedding's plan, but for another thread of evidence. I had occasion, in 1881, to cut a deep drain across the cathedral precinct on the south side, and I looked with interest for the uncovering of part of the walls of the old Four Courts.\* I found the walls where I crossed them exactly as laid down in Sedding's plan, but found a remarkable difference in the walls themselves. The east and west walls of the old Court of Common Pleas did not go down to a deep foundation, but were borne above the peat stratum on great beams or cradles of massive oak. The west wall of the King's Bench, however, was different. It was carried down to a greater depth, to the solid foundation beneath the peat, and was an enormously solid mass of ancient masonry. Here I recognised an ancient wall of the monastery. I also laid bare and ascertained the ancient level of the cloister garth, finding it about nine feet below the church floor, and nearly on the level of the floor of the crypt. This solved several problems of built-up doorways, steps, and approaches, which had puzzled everyone. The existence of a cloister-garth at such a level, levelled for and scooped out in the side of a steep declivity, was unexpected.

A practical mind will at once infer the existence of a great retaining wall somewhere that would be required to keep back the overhanging bank on the south side. Sedding's map at once indicates it. A narrow yard, or area—say four or five feet wide—which may be traced along the back of the houses in Skinner's Row, described as for instance :—

"The precinct wall, serving as a backside to the houses of Mr. Wingfield and Mrs. Parsons, in Skinner's Row, and giving light to their back rooms."

Thus I can trace the limit of the monastic buildings at the south side. I was disappointed to come on no remnant of the eastern precinct wall, in what is now St. Michael's Hill, but Mason's map lays down its limit, and it exactly coincides with the line of the west side of Christchurch Lane, as it existed in 1761, about the centre of the present roadway. It is parallel with the ancient wall to the west of the King's Bench Court, before alluded to, so that here we have, with but little conjecture, the limits defined of the Domus Conversorum, sometimes known as the Common House, which we would look for in the usual monastic plan, and we recognise, under a misunderstood and corrupted name, the "Commons House" of Christ Church Cathedral, so often mentioned in records, where sundry parliaments were held, the last in 1559; not a "House of Commons," but the common house of the guests, postulantes, and brethren of the monastery.

Analogy of similar plans would lead us to look for the abbey gateway in the north-west corner of the group, and then we suddenly recall that we all remember it, unrecognised as such, before the late restoration. There are photographs showing it extant. Little knowing that the cloister level lay 9 feet under the surface of the soil, one did not recognise in the cellar-like arch above it the head of the abbey gateway. Its site was exactly under the doorway of the present south-western porch. A gate-house lodge, or parlour, should have been about here; my restora-

\* The Four Courts were built upon the site, and in part on the foundations of the monastic buildings and cloister garth by the Crown, in 1695; the Dean and Chapter receiving 10*l.* per annum rent for the ground. The last remains of these were covered in about 1826.

tion of this feature is purely conjectural. Assuming the precinct boundary to fix the width of the Common House, I conjecture it as arched in two spans, with a row of pillars down the centre, as would be most usual in such a building.

For the refectory I have only, I admit, such slender evidence as the precinct boundary well-defined, and the analogy of other monastic plans affords: we know from precedents that it should be traced here. Taking all the evidence which has been recited, and other minor corroborative hints which the old plans afford, one can sketch the cloister plan so far, but to find that there would not be room for the refectory to stand east and west in the usual way, between the south cloister walk and Skinner's Row. It could not have projected from the group standing north and south, as it does in other places, because the limit of the precinct forbids. One then recollects the declivity of the ground, and that if it had been planned upon the same level as the cloisters, it would have been many feet below Skinner's Row, and that passers-by would have looked down into its chimneys. Everything points to the conclusion that the refectory was not on the ground-level, but on that of the dormitories, and extended over the south cloister walk. Here, again, the plans give faint indication of a passage next the kitchen, which would exactly serve in position for a staircase between the kitchen and refectory.

The following are definitely or approximately the internal dimensions of the several parts of the plan :—

Cloister garth and cloisters . . . . .	76 feet by 84 feet.
East Side—Dormitory staircase leading to church, . . . . .	25 feet ,, 7 feet.
Chapter-house . . . . .	42 feet ,, 20 feet.
Slype . . . . .	28 feet ,, 8 feet.
Kitchen . . . . .	30 feet ,, 30 feet.
South Side—Staircase . . . . .	26 feet ,, 7 feet.
Refectory . . . . .	75 feet ,, 33 feet.
West Side—Common House . . . . .	82 feet ,, 29 feet.
Lodge . . . . .	29 feet ,, 10 feet.
Gateway . . . . .	17 feet ,, 7 feet.

Beyond the cloister walls, speculation can but vaguely follow the existence of the inferior buildings of the monastery. The broken outline of the precinct suggests the projection of square buildings, and one places the finger on the spot where the infirmary would most likely be. A shred of evidence is, I believe, locked up in a term I cannot construe. Sedding, in his schedule of tenements, describes several of them in this wise, *e.g.* :—"23. Part of *Coolfabius* as a backside to Mr. Sillcock's house in Skinner's Row."

When I trace out the plots described as "Part of *Coolfabius*," and obliterate modern boundaries and walls, I find that this is a corner by the east wall of the kitchen, and under the great overhanging wall of the precinct. I believe I recognise in the name the Irish word *cuil*, a corner, and I look with confidence to some better antiquary to interpret what this corner was.\* It is the spot where one would look for the offices of baser use—the middens, privies, and great drain from the kitchen.

Under the present green sward, between the railings of Christchurch Place and the church, antiquaries may assume the foundations of these buildings lie, and may yet be investigated. It may be a parallel for the discovery of a fragment of the cloister of old St. Paul's, which has led to the creation of a pretty garden in the heart of London, if we should some day uncover some of our cloisters to be an object of interest in the city garden, which I hope may be created in the yard of Christ Church Cathedral.

## PARIS NOTES.

M. GAILLARD, a rich amateur, has announced his intention of founding a travelling scholarship for young architects desirous of visiting the architectural treasures of France. It will be awarded by open competition, and the jury will be chosen by a ballot of the competitors themselves.

In the first stage of the Achille Leclère competition in architecture, the authors of thirteen out of the twenty-seven sketches sent in have been admitted to take part in the final contest. The completed designs must be forwarded to the secretary of the Institute on or before February 29 next, and judgment will be announced on March 8.

\* Dr. Joyce, on being consulted, is unable to form an opinion as to the meaning of this name.

Another architectural competition, that for the Prix Godebœuf, one of the most important of the year, has been decided, the winner being M. G. Le Roy, a pupil of MM. Coquart & Géraldt. The subject given was a "funeral monument."

M. Lauson, sculptor and Grand Prix de Rome, has just presented to the Académie des Beaux-Arts a plaster statue of the Comtesse de Caen, who was known, as the artist's benefactress. Madame de Caen is represented seated in an arm-chair, holding her will in the right hand and a small statuette in the left. The work is to be placed in the museum founded by and named after the Countess.

Several of the Paris papers announced erroneously that the famous Panthéon mosaic would be uncovered during the *neuvaine* (or anniversary week) of Sainte-Geneviève, the patron saint of the edifice and of Paris. The artists to whom this beautiful work was entrusted asked eight years for its completion. Five years have scarcely elapsed since its commencement, and the mosaic itself may be said to be finished; but the frame and other details remain to be done, and will require about two years for their completion. It is not expected, therefore, that the work can be given to public view before the year 1886.

The old building known as the "Tour du Moulin" (Miller's Tower), that stands in the Montmartre Cemetery, was lately threatened with destruction by the authorities of the cemetery, in order to utilise its site for burial purposes. On hearing of this intention, however, the Historical Monuments Commission came to its protection, with the result that the destroyer's hand has been arrested, and this interesting relic of the seventeenth century will be preserved. According to archæologists, the tower belonged to a mill built by the Frères de la Charité—a religious body that first established itself in Paris on the invitation of Marie de Medicis.

Several important resolutions affecting the regulations of the National Triennial Salon have been arrived at by the superior Council of Fine Arts. At the first exhibition of this kind, held last autumn at the Palais de l'Industrie, in the case of works that had already been publicly exhibited, a written notice or description of the subject was all that was required for submission to the jury. In future all works sent in will have to be personally inspected by the jury, of which the Director of National Museums, the Conservators of the Louvre and the Luxembourg, the Director of Public Buildings, and all ex-directors of fine arts, will henceforth be *ex-officio* members. The number of works to be admitted has, moreover, been considerably reduced—the paintings from 800 to 600, the drawings and water-colours to 150 in all, and architectural designs to 40. It was proposed to the Council to decide that the exhibition should comprise a certain fixed number of entirely new works; and the discussion made it evident that the admission is likely to be encouraged. This seems hardly compatible with the avowedly retrospective nature of the exhibition, and goes far to account for and justify the hostile attitude now being taken up by the Artists' Society towards the Triennial Salon, particularly as the next one is fixed for May 1886, when it will directly clash with the annual Salon, which opens about the same time.

Immense buildings are now in course of construction as an annexe to the Lycée Louis-le-Grand. They occupy a corner of the Luxembourg Gardens lying between the Rue d'Assas, the Avenue de l'Observatoire, and the Rue de l'Abbé de l'Épée, their total ground area being upwards of 10,000 square mètres. Operations were commenced in March last, the masonry work is nearly finished, and the new college is expected to be ready for occupation by the end of the present year.

A remarkable mosaic has just been discovered at Nîmes. It is no less than 12 square mètres in superficial area, and represents a Roman emperor seated on his throne with a nude female figure beside him; in the foreground two servants are depicted leading, one a lion, the other a wild boar; behind the throne stands a soldier with the Roman helmet, and on one side a number of slaves are represented as arriving in a great state of hurry. This valuable relic of old Gaul has fortunately escaped without damage from the picks of the excavating workmen; the design is perfectly clear and the colours almost as fresh as if recently executed. The

local journals, with perhaps a little pardonable exaggeration, talk of the new find as worth a million francs, and competent judges declare it to be certainly the most beautiful mosaic of the epoch yet discovered, while it appears that the late owner of the house beneath which it was found received only 40,000 frs. from the municipality when his property was lately expropriated for improvement purposes. The mosaic is to be enclosed in a strong iron frame and placed in the temporary museum, pending its removal to the permanent Art Galleries and Museum now being erected by the town.

THE NEW LAW COURTS.

It is gratifying to find that there is at least one official who is willing to testify that the new Royal Courts of Justice have some good qualities. Mr. G. G. Kennedy in relating his own experience says:—There is one virtue in the courts which is of paramount importance to those whose duties, like mine, compel them to be in attendance from half-past 10 to 4, and that is ventilation. The air circulates freely, and in this respect the courts compare favourably with all other law courts in the kingdom which it is my fortune to know. Some, I know, complain of draughts; but where, may I ask, is there not one person in a court of justice who makes this complaint whenever the air is freshly circulated? The consequence is that, instead of feeling wearied and depressed at the end of the day, as one used to feel after a similar day's work in the Westminster courts, one feels fresh and able to settle down to work in chambers without the struggle against that feeling of exhaustion and "court headache" engendered in the old days. The acoustic properties of the present courts are not so good as they might be, but sitting in the third row of benches one can hear sufficiently well. The passages are rather dark; but this is a matter surely of secondary importance. The courts may not be easy of access; but their inaccessibility is not an unmixed evil, if it only places obstacles in the way of that army of unsavoury loafers who used to crowd into the courts at Westminster. I can only add that since the change to the New Law Courts I have felt a different person after my day's work there, and that I am ever grateful to the eminent architect who designed them, and to others to whom I am indebted for the present improvement.

BUILDING IN GLASGOW.

It is satisfactory to find that there are now better prospects for builders in Glasgow than has been the case. The *Glasgow Herald* says that the position of the building trades is a matter of current knowledge. On every hand structural operations can be seen in progress, and these are of such a nature that for some months to come there cannot be any diminution of the prosperity which set in early this year. Of new works there are notably the Municipal Buildings, just commenced; the restoration of the extensive properties recently destroyed by fire in Buchanan and St. Vincent Streets, the extensions at the City Fever Hospital, London Road; the operations in connection with the City and District Railway, as well as many more private undertakings which have been arranged for in different quarters of the city. A good idea of the amount of building-work on hand—though sanctioned, the greater proportion remains to be executed—will be formed from the following statement, kindly and specially prepared by Mr. John Whyte, assistant master of works:—

LININGS GRANTED BY DEAN OF GUILD COURT, WITH VALUATIONS IN 1882 AND 1883.

Nature of Operations.	1882.		1883.	
	Linings.	Valuation.	Linings.	Valuation.
New dwelling-houses and shops	24	£97,050	25	£113,500
Alterations on shops and dwelling-houses	35	13,671	41	17,855
Warehouses, workshops, offices, stables, byres, and alterations on such premises	144	290,830	157	193,276
Churches, halls, schools, and other buildings for public purposes with alterations in such	24	97,865	24	360,369
Totals	227	£499,416	247	£684,980
Increase, 1883	—	—	20	£185,564

The masons—of whom there are about 1,800—now receive 7½d. per hour, which is ½d. higher than last year's rate. Bricklayers are paid 8d. and slaters 7d. per hour.

## NOTES AND COMMENTS.

THERE is an interesting exhibition in Bond Street, in connection with the Art for Schools Association. The committee have brought together several engravings, etchings, and autotypes from good pictures, and the object of the association in suggesting what kind of illustrations can be had without much cost is laudable, and deserves encouragement. The largest and by far the cheapest example in the exhibition is the copy of the frieze by M. DIDIER, which was published in *The Architect*. But we trust that the system of mounting it adopted by the Committee will not be followed by teachers. From its length it was necessary that the frieze should be published in sections, but the margins of the divisions do not require to be perpetuated; there is no advantage in having the parts of a figure separated by a white space, and the arrangement would naturally be puzzling to a child.

ONE of the most pleasing of the old Greek legends is that which relates the contest between a flower girl and a painter. The girl was to make garlands and the painter to copy them, but in the end the girl was victorious, for she combined flowers with a dexterity that the painter was unable to follow. The contest has been made the subject of a picture by Signor SCIFONI, which is engraved in CASSELL'S *Magazine of Art*. But unfortunately the legend was unknown to the company's writers, and the picture is interpreted in a characteristic fashion:—"PAUSIAS is interested, GLYCERA for once is embarrassed: it is the beginning not only of a masterpiece, but of an affair of the heart. Even now it is not impossible for painters to fall in love with their sitters. The present picture, with its inspired painter, its sweet and gracious model, its chorus of pretty duennas, may not be inaptly described as," &c. Writing of this style may be captivating to milliners' apprentices, but we should like to know what Signor SCIFONI thinks of it, and of the competency of English *littérateurs* to degrade a picture.

A SOMEWHAT similar discovery has been made by the art critic of the *Standard*, in his description of Mr. LONG'S picture *Anno Domini*. In this work (which the artist wished to call by the more appropriate title *The Unknown God*) there is a procession of Egyptian priests and other dignitaries, and a figure of ISIS is made one of the principal objects. There is never much difficulty in deciding that ISIS was a goddess, not a god. But the *Standard* critic says, "It represents the chance encounter of two processions within sight of the Pyramids. One is the procession of ISIS, with the god himself, his priests, his fair minstrels, &c." When it is remembered that this sentence was examined by readers and sub-editors, and probably by the editor himself, it would appear that the *Standard's* scholarship is still as remarkable as when in a leading article AUGUSTINE of Canterbury was confounded with AUGUSTINE of Hippo. With such examples before them, and remembering other blunders, is it surprising that painters and sculptors do not welcome journalists to their studios?

THE destruction of the Roman Catholic Church at Leamington by fire has been made the opportunity by the Rev. Canon LONGMAN to teach some important lessons to his brother clergymen. The first is, that no organ tuner should be allowed to go to the organ without the knowledge of the rector of the church, and that an unprotected candle should not be used while working within the instrument. The second is, that churches should be provided with adequate means for extinguishing fires. Although at Leamington the office of the fire brigade was near the church, and notice was sent there at once, the men of the brigade were not ready, and the half-hour's delay was the loss of the building. Lastly, it is recommended that the property should be insured at full value, which was not the case at Leamington. This advice is useful, although in some places it would be difficult to find enough men to use the apparatus for extinguishing, or enough water. But if organ tuners and the workmen who are employed for occasional jobs were properly overlooked, there would be little danger of fires in churches. In those cases there is no supervision.

THE restoration of the west front of Lichfield Cathedral is now almost completed, as far as the structural portion of the work is concerned, and seventy-three of the one hundred and

twelve niches already contain figures, most of them given by individual donors during the progress of the restoration since 1877. Of the remaining thirty-nine niches, some are occupied for the present with the old Roman cement figures of kings of the Norman dynasty. There still remain, however, some twenty-five vacant niches to be filled. Of the figures specially wanting to complete the western façade proper, there are four of the minor prophets, two of the archangels, and two of the Apostles. The Dean is desirous to obtain donors for these while the scaffolding is still standing, the contractor, Mr. THOMPSON, having kindly allowed it to remain for a while in the hope that more figures may be promised. The cost of a figure varies from 26*l.* to 45*l.*

During the ensuing session the following papers will be read at the ordinary meetings of the Society of Arts:—"Electric Launches," by A. RECKENZAUN; "Science Teaching in Elementary Schools," by WILLIAM LANT CARPENTER, B.A., B.Sc.; "Coal Gas as a Labour-saving Agent in Mechanical Trades," by THOMAS FLETCHER, F.C.S.; "Sanitary Progress," by B. W. RICHARDSON, M.D., F.R.S.; "The Progress of Electric Lighting," by W. H. PREECE, F.R.S.; "Forest Administration in India," by Dr. BRANDIS, F.R.S.; "Reclamation of Land on the North-Western Coast of England," by HYDE CLARKE; "Water Regulation in England," by General RUNDALL; "Telpherage," by Professor FLEEMING JENKIN, F.R.S.; "New Process of Permanent Mural Painting" (invented by ADOLPH KEIM, of Munich), by Rev. J. A. RIVINGTON; "Slate Quarrying," by W. A. DARBISHIRE. Courses of Cantor lectures will be given on "Recent Improvements in Photo-Mechanical Printing Methods," by THOMAS BOLAS, F.C.S.; "The Building of London Houses," by ROBERT W. EDIS, F.S.A.

A new arrangement is to be made in regard to the frescoes in the Manchester Town Hall. Originally it was agreed that, out of the eighteen frescoes, nine were to be painted by Mr. FORD MADOX BROWN, and nine by Mr. F. J. SHIELDS, the price for each panel being 275*l.* Two or three years ago Mr. SHIELDS informed the Town Hall Committee that he was unable, on account of the condition of his nervous system, to undertake the commission. It was resolved on Wednesday to entrust the remainder of the frescoes to Mr. MADOX BROWN. The Council have also shown liberality in their dealings with the artist. Mr. MADOX BROWN found that he was impeded in his work by the number of visitors to the Town Hall, and he applied for an increase of the price, which was absurdly low. An extra sum of 100*l.* will be paid for each fresco that has been completed, and the price for the remainder will be also 375*l.* each. Considering the labour expended by Mr. MADOX BROWN on those works, it is astonishing how he can be sufficiently remunerated with even 375*l.*

A portrait of the late Mr. J. H. CHAMBERLAIN has been offered to the Birmingham Art Gallery by Mrs. CHAMBERLAIN. It is stipulated that the following words are to be placed beneath the portrait:—"In loving memory of JOHN HENRY CHAMBERLAIN, a portrait of him is given by his wife and children to the Art Gallery of Birmingham, in the year 1884." But as it would not be a good precedent to set up, the Gallery Committee will hardly be able to accept the gift unless the inscription is withdrawn. The portrait is by Mr. RODEN.

The late Mr. HOLLOWAY had a great deal of the despot about him, although he considered it was only remarkable decision of character. At the time when he was arranging the competition for his colleges, the writer happened to speak to him about the nature of the report that the consulting architect was to prepare, whereupon Mr. HOLLOWAY—in novelist's language—drew himself up to his full height, and said, "I look upon myself as the Emperor of Germany! I receive reports and advice, but it rests with me whether they are to be acted on, and I shall select the design which best pleases me." He did not, however, announce his determination, and under the circumstances a consulting architect appeared to be useless. Mr. HOLLOWAY wished to have a grand Gothic edifice, but his adviser was selected on the ground that he was not distinguished as a Goth. "In the present state of architecture," said Mr. HOLLOWAY (and the words indicated his shrewdness), "it would be impossible to find a Gothic architect who would be impartial. Every man has his pet style, and he dislikes all others."

THE DEPARTURE OF BALDWIN AND THE CRUSADERS.

THE event which has been depicted by M. GUFFENS on the wall of the Hôtel de Ville at Courtrai, was of some importance in the history of Flanders. For Count BALDWIN it was the first scene in a tragedy in which he was destined to be the principal actor. The time selected is the year 1202. A little more than a century had elapsed since the warriors of Western Europe had departed to take part in the first struggle for the possession of the Holy Sepulchre at Jerusalem. The city had been conquered, and the kingdom of Jerusalem established, with GODFREY of Bouillon as king. In fifty years the Christian power in Palestine was weakened, Jerusalem was threatened by the Mahommedans, and it was necessary to preach a second Crusade. There was unparalleled enthusiasm. All ranks were attracted, but the enterprise was a failure, and it is calculated that two hundred thousand people perished in Natolia, with as little apparent advantage to the cause as if they were so many flies. Jerusalem fell into the hands of SALADIN. It is difficult for us in the nineteenth century to realise the consternation which the news excited in Europe. In the St. Edmundsbury Chronicle it is related that "at the retaking of Jerusalem by the Pagans, Abbot SAMSON put on a cilice, or hair shirt, and wore under garments of haircloth ever after; he abstained also from flesh meats thenceforth to the end of his life." The Abbot was but following the general practice of making pain a reminder of what Christendom had undergone. Mr. CARLYLE sees in all this mortification something that is very noble; and from the depths of his pessimism he admires the earnest reality of it as marking an age when "glimpses of bright creatures flash in the common sunlight, angels yet hover doing GOD's messages among men; wonder, miracle encompass the man; he lives in an element of miracle, Heaven's splendour over his head." There was at once a third Crusade, and, after three years' fighting, a treaty of peace for a short term was concluded with SALADIN, who was allowed to retain Jerusalem. By his death, which dissolved the unity of the empire, it was supposed that all obstacles to the recovery of the city were removed. A large army of Germans was dispatched; but from want of loyalty in the commanders nothing was done. The accession of INNOCENT III. to the papal throne in 1198 gave new life to the enterprise. FOULQUES DE NEUILLY, following the example of PETER the Hermit and BERNARD of Clairvaux, urged upon men the duty of reconquering Jerusalem, and he was seconded by the eloquence of MARTIN LETZ and HERDOUIN. The great kings did not engage in the movement, for their states had suffered much from the former efforts, and the new Crusade was undertaken mainly by petty princes. In this way BALDWIN of Flanders became a crusader. He had at an earlier date shown his courage by taking the part of RICHARD CŒUR DE LION in the quarrel with PHILIP AUGUSTUS. An immense force was organised by him in his own country, and was joined to those of his brother-in-law, THEOBALD IV. of Champagne, LOUIS of Chartres and Blois, BONIFACE of Monferat, and other princes. BALDWIN, who was born in 1171, succeeded to his mother's possessions in Flanders in 1193. His wife was the daughter of the King of France, who wished to accompany him to the East. On joining the crusaders in 1202, BALDWIN appointed one of his brothers to be regent. He never saw Flanders again. It is not surprising that Mr. GUFFENS represents the Count with the sad expression of a man who is taking a last look of his country.

The great loss which attended a land journey was known, and it was resolved to try the experiment of travelling by sea; but for this purpose transports were necessary, and the Venetians and Genoese could alone supply them. Hitherto the Venetians had taken no part in the Crusades, and as traders they had an interest in the existence of the Mahommedans in the East. A deputation from the commanders was therefore sent to the Senate for the purpose of obtaining vessels to carry the troops. A bargain was struck. Galleys and men were supplied, and the old doge DANDOLO agreed to accompany the crusaders. One of the conditions was that the army should be first employed in conquering the town of Zara, in Dalmatia, which had revolted from the Venetians. It was easily overcome, and the strange spectacle was presented of crusaders staining their swords with the blood of their fellow Catholics. The champions of the Church were forthwith excommunicated by the Pope. But a more important

prize was coveted by the Venetians, and the Soldiers of the Cross were next directed, and it may be not unwillingly, to Constantinople, which was then the capital of a Christian Empire, and renowned for its riches. There they were also successful. Neither age nor sex nor religious profession was spared. The wealth that was seized was enormous, and GIBBON calculates that the share secured by the French pilgrims was "equal to seven times the annual revenue of the kingdom of England." The city possessed many masterpieces of ancient Greek sculpture; those in marble were destroyed, and the works in bronze were melted for the sake of the metal.

The rapacity of the rulers increased as time went on, and the next stage in the history of the Crusade was the election of Count BALDWIN as Emperor of Constantinople. The scene which followed is described by MILLS. The barons and knights, agreeably to the Byzantine custom, elevated the Emperor on a buckler, and bore him into the church of St. Sophia. When the pomp of magnificence and dignity was prepared, the coronation took place. The papal legate threw the imperial purple over BALDWIN; the soldiers joined with the clergy in crying aloud, "He is worthy of reigning," and the splendour of conquest was mocked by the Grecian ceremony of presenting to the new sovereign a tuft of lighted wool, and a small vase filled with bones and dust, as emblems of the perishableness of grandeur and the brevity of life. BALDWIN was granted one-fourth of the provinces; of the remainder a great part was seized by Venice, and the leaders of the expedition were rewarded in proportion to their importance. But the new rulers were unable to gain the affection of their subjects. They bestowed offices on their countrymen, and the hatred of the Greeks was excited by jealousy as well as by theology. On an invasion by Bulgarians the Emperor BALDWIN was captured in 1206. The result had best be described in the words of GIBBON:—

The manner of his death is variously related by ignorance and credulity. The lovers of a tragic legend will be pleased to hear that his hands and feet were severed from his body, that his bleeding trunk was cast among the carcasses of dogs and horses, and that he breathed three days before he was devoured by the birds of prey. About twenty years afterwards, in a wood of the Netherlands, a hermit announced himself as the true Baldwin, the Emperor of Constantinople, and lawful sovereign of Flanders. He related the wonders of his escape, his adventures, and his penance, among a people prone to believe and to rebel, and in the first transport Flanders acknowledged her long-lost sovereign. A short examination before the French court detected the impostor, who was punished with an ignominious death; but the Flemings still adhered to the pleasing error, and the Countess Jane is accused by the greatest historian of sacrificing to her ambition the life of an unfortunate father.

After a year's mourning, BALDWIN was succeeded in the emperorship by his brother HENRY, who reigned until 1216. With him the male line of the Counts of Flanders came to an end.

ROYAL EXCHANGE ASSURANCE OFFICES, PALL MALL.

WE give an illustration this week of the Pall Mall front of the Royal Exchange Assurance Offices, now in the course of erection from the designs of Mr. GEORGE AITCHISON, A.R.A. The frontage is narrow—not much more than 22 feet. On one side is the imposing mass of the Junior Carlton; on the other some common brick houses. A tall fanciful gable detaches the building from the club-house. The front is nearly all window, and the piers are enriched with engaged colonettes on three storeys, while the ground floor and attics have caryatides. These are to be modelled by Mr. J. E. BOEHM, R.A. The uniformity is relieved by two projecting balconies on the second floor, and by a small central porch on the ground floor. The front is of red Mansfield stone, but a little variation in colour will be got by means of granite, colour, and gilding.

The Board of Trade have informed the promoters of the South Eastern and Channel Tunnel Railways Bill, and those of the Channel Tunnel Railway Bill, that if the Bills which have been deposited are persevered with it will be the duty of the Government to oppose them in Parliament. The promoters will not, it is said, abandon their Bills.

An Early Work by Turner has been purchased in Sheffield for the small sum of 5s. The picture has been examined by Mr. Ruskin and is considered by him to be a genuine example.

## OFFICIAL NOTES ON FOREIGN TRADE.

THERE is a very considerable amount of house building going on in Constantinople, which may be accounted for in this way. The prices of all kinds of materials are exceedingly low, labour is plentiful and cheap, and the value of ground has gone down to less than one-half what it was five or six years ago. Under this combination of favourable circumstances there are few investments which have more attractions for the man of moderate capital. Two classes of houses give good returns; those which contain from eight to ten rooms, and which can be let for from 80*l.* to 100*l.* per annum, and large houses constructed in "flats," which are eagerly sought after by people of moderate means. The rent of these flats varies from 50*l.* to 100*l.* each according to situation and accommodation. First-class houses are no longer constructed, being considered bad property. Those which, ten years ago, brought in a rent of 300*l.* and upwards, can now be had for less than one-half. The rents still paid for shops in good positions is, however, something extraordinary, considering the general depression in trade.

One of the defects of Constantinople has been the insufficient quantity of water. The population, which is calculated at 1,100,000, has been supplied from the "bends," or artificial reservoirs of Belgrade, which yield 1,320,000 gallons daily in winter, and in summer 770,300 gallons. This quantity is only equal to 1.32 gallons per head, and in the suburbs the daily supply is not quite a gallon per head. In summer the price is 3*d.* and even 4*d.* per measure of 6½ gallons, and in the season water never sells at less than 1.6*d.* per cubic foot. This state of things will soon be altered for the better. A company has been formed, under the title of "La Compagnie des Eaux de Constantinople," by a group of twenty-one European banking and financial establishments for the purpose of supplying the city and its suburbs with water from Lake Dercos, and the numerous springs and streams which feed it. The yield will be between 5½ and 6 millions of gallons. The nominal capital is 800,000*l.*, divided into 40,000 shares, but no public emission of shares will take place until after the completion of the works. The daily supply will be increased so as to allow of about 7 gallons daily per head, and by the terms of the concession the price is fixed at 92 centimes the cubic mètre, or about 25 gallons for 1*d.*

Trade in Erzeroum is in the lowest condition that has been known for years. All merchants agree in declaring that there are no purchasers of any kind of goods except the barest necessities of life. After the war with Russia there was a certain amount of money in the city owing to the extravagant prices which the army of occupation paid for everything. But this spoil has gradually disappeared, and there is no method of replenishment of empty purses, commerce being at a complete standstill. Land is worth only a quarter of its value before the war, chiefly owing to the fact that the Mussulmans, who are the principal purchasers of land, suffered such heavy losses in the provinces that were occupied by Russia. They feel that there is no security of tenure in a frontier vilayet. Houses also in Erzeroum fetch half their real value, and sometimes even less. A house which cost 1,100*l.* about seven years ago was sold lately by auction, and, though in perfect repair, was knocked down for the sum of 450*l.* Buildings for military government and provincial purposes have been carried out to a great extent; also clinics, schools, and private buildings, although no longer so easy of sale or to let, are still being carried out, and the town has quite a different aspect than it formerly had. The small low houses have disappeared, and large buildings of four or five storeys have been erected.

In Königsberg the wood trade has made considerable progress, and promises to become much more important than formerly, although the port cannot compare with Memel and Dantzic in this branch at present. The shipments are retarded by the shallowness of the channel. Sales of wood goods in the town were difficult, on account of the depreciation in the value of houses and want of money among many builders. The newly-introduced timber import duties, the differential duty between rough-hewn wood and sawn wood goods, and the contemplated further increase of import duty and delay at the borders thereby occasioned, and the waste of time and hindrance in measuring, are pressing hard on the wood trade. The trade in cement has been very large of late, about 50,000 barrels a year are imported, chiefly of German make. Portland cement realises 8 marks per barrel of 180 kilos. A great deal went to Russia, where it is required in building the numerous fortresses at Goniads, Kowno, Warsaw, &c.

From St. Vincent it is reported that the municipal authorities have laid the foundations of a new municipal hospital, the building in use at the present time being quite inadequate to meet the requirements of the town and shipping. However, the work progresses but slowly, and will in all probability not be completed for some time to come. The same body have also erected a new parochial

school-house for girls, together with a residence for the mistress. The paving of the principal streets having been completed, that branch of the public works has been suspended for the present, but a large number of back streets still remain unpaved. No steps have as yet been taken with regard to conducting water into the town from the springs at Madeira, although competent engineers have declared in favour of the project. St. Vincent, therefore, remains dependent on St. Antonio for its water supply.

The manufacture of Portland cement has increased largely in the Boulogne district. The manufacture of iron gas and water pipes in Marquise, which was a few years ago one of the great industries of the neighbourhood, is on a much smaller scale than formerly. As soon as the iron ore of the district was exhausted it was found that the manufacture could no longer be carried on so successfully with imported iron and imported coal. The new company, however, still continues to work on a reduced scale, with the aid of importation of pig-iron from the north of England and iron ore from Spain.

The principal towns in Belgium will be shortly placed in communication with each other by means of the telephone; an advantage the benefit of which, to business men and to the public generally, cannot easily be over-estimated. A temporary experiment, by arrangements extending over a period of five days, was made lately between Antwerp and Brussels, the result of which is described as having been highly satisfactory. The subscribers were able to communicate with one another with perfect ease, and a voice of average strength could be distinctly heard at each extremity without any unusual effort being required on the part of the speaker. Communications have also been exchanged between Brussels, Antwerp, and London by wire and cable, and it is said that arrangements will be speedily entered into with Holland, by means of which a close system of telephonic intercommunication will be established between the two countries. The system adopted in Belgium is that introduced by M. Van Rysseberghe, Director of the Meteorological Department of the Brussels Observatory.

Manufacture in Servia is in its infancy. The Servian Government are doing all in their power, however, to promote and encourage it, and offer monopolies and exemptions from duty to foreigners who may desire to try investment of their capital in it. Among Servian textile manufactures are the Pirot carpets, which are woven with wool to any design, of any size, and in any variety of colours. The crimson colour usually predominates, and the carpets are woven so as to present exactly the same appearance on both sides. Though not thick they are exceedingly durable, and for that reason are to be seen on the floors, beds, and divans of all Servian houses of the better class. They cost at Pirot about 10*s.* per square yard. Besides the carpets of Pirot there are those of other places in Servia of a commoner and cheaper quality, but also very durable. For halls and corridors, goats' hair carpet is used about two feet wide, costing 2*s.* 6*d.* per mètre, and exceedingly durable. These are woven in the natural colour of the goats of the country, grey predominating.

## PUBLIC STATUES IN LONDON.

AN article on "The Statues and Monuments of London" is contributed by the First Commissioner of Works to the *Nineteenth Century* for January. In it a classification is given of all the memorial statues in London, whether in public places, in Westminster Abbey or in St. Paul's. Concerning the omissions among "open air statues," Mr. Shaw Lefevre writes:—

It will be seen, then, that the total number of statues is about fifty, of which eighteen are of royal personages, and of the remainder all have been erected within the present century, and by far the larger proportion in the last twenty years. There are no statues of the greatest of English warriors, of Edward the Third, or Henry the Fifth, or Blake, or Marlborough. There is none of Cromwell. Chatham is equally without tribute of this kind. Milton, in spite of his associations with London, has no recognition except that of a bust in the Abbey. To Dr. Johnson a statue has been erected at Lichfield, the place of his birth, but none in London, where nearly the whole of his life was passed and where he died. The statues by Foley of two celebrated Irishmen, Burke and Goldsmith, erected in front of Trinity College, Dublin, are among the very best works of art of modern times, but in London, where their lives were spent, there are no statues of them in the open air. It was at least to be expected that the Benchers of the Temple Inns would have done something in honour of one who was so long connected with the Temple, and who was buried in their church. A statue of Charles Dickens in some one of the many parts of London identified with his works would be appropriate. Compared with these it may well be doubted whether many of those to whom statues have been erected in the last twenty years are worthy of the honour. It is a question whether any statue should be

erected until ten years or more have elapsed since the death of the subject. This would avoid many which are decided upon in the excitement of grief and regret immediately after death. What is still more to be deprecated is the erection of a statue during the life of its subject, except perhaps in the case of the most eminent.

In any case it is not desirable that statues should be multiplied unduly. In the view of many people, London, by reason of its climate, is unsuitable for statues in the open air, at least without canopies. It may be replied to this that the suitability of a statue depends wholly upon the work itself. Really good works of art like the best of those which have been named are certainly not out of place even in London; they rise superior to the conditions of the atmosphere and to their environment. A bad statue, however, is intolerable; there is no escape from it; it adds to the gloom of its neighbourhood, it intensifies all other bad conditions, and is a public misfortune. A statue once erected in a public place can be removed only under most exceptional circumstances. Too great care, then, cannot be taken by the authorities in consenting to the erection of a statue. There is nothing of which it is more difficult to judge the effect in advance. The small model of a statue may please, the full-sized cast in the studio may look well, but when the final result in bronze or marble is put on its pedestal in the place of destination, the result may be eminently unsatisfactory, and perhaps to none more so than to the artist himself. It may be a question whether, before giving final permission for the erection of a statue, it ought not to be required that a model in plaster, coloured to represent bronze, should be placed on the intended site, and whether a committee of taste should not be the final arbiters in a matter so delicate and difficult.

Mr. Shaw Lefevre next describes the statues in Westminster Abbey, and advocates the removal of some of them. This leads to a consideration of the project of erecting a monumental chapel:—The fact is, that the available space in the Abbey is too small for what already exists there; and it is certain that in the future, monuments must either be reduced to the smallest busts, to be stuck up wherever a vacant corner can be found, and irrespective of their surroundings, as is now too often the case, or the demand for this national recognition must be refused altogether.

On the other hand, it would be a most serious misfortune that a break should be made in the continuity of this splendid roll of monuments to the great and illustrious men of the Empire, or in the gallery of monumental sculpture, in which so far all that are eminent in that line of art have hitherto been represented. The subject is one which has long occupied the attention of those most interested in the Abbey. It was one in which Dean Stanley felt the deepest concern. He felt, as all have done who are cognisant of the facts, and who appreciate the Abbey in its various functions, that an effort must be made to extend its limits and to give greater space for monuments, if not for burials in the future. Of the burials in the Abbey much might here be said. If it be advisable to continue them at all at Westminster, it is certainly most desirable that they should no longer be carried out within the Abbey proper, and that another and more fitting place should be found for them.

It is in this view that a proposal made by Sir Gilbert Scott found favour. I have already alluded to it in a former article on "London Improvements" in this Review. The proposal of Scott was to build a cloister, or rather a monumental chapel, to the north-east of the Abbey, along the line of the houses in Old Palace Yard and Abingdon Street, and communicating by a covered passage passing under the buttresses of the Chapter-house. The proposal would involve the demolition of all the houses in Old Palace Yard and in Abingdon Street as far as Great College Street, and the purchase of this property would cost about 200,000*l.*, a very large sum to expend in demolition.

For my own part I think that Scott's plan is open to some objection; the frontage of the chapel or cloister which he proposes would extend eastward beyond the extreme end of the Chapel of Henry the Seventh, and the interesting old Jewel Tower, at the back of Old Palace Yard would again be hidden behind it. I incline to think that any addition to the Abbey in this quarter should not extend beyond the east end of Henry the Seventh's Chapel. This would bring it into a line with the Jewel Tower. A monumental chapel might be constructed in conformity with this view on the site of the houses on the east side of the Little Cloisters, and united to the Abbey in the manner proposed by Scott. This would involve the demolition of the houses in Old Palace Yard only, at a cost of about 80,000*l.*

Supposing the chapel to cost about 50,000*l.* the total sum required would be 130,000*l.* Of this the main portion, it seems to me, should be subscribed by the public, if some wealthy benefactor could not be found to undertake it; and upon this condition, and speaking unofficially, I cannot but think there would be a strong claim for assistance to so great a cause, national, metropolitan, and ecclesiastical, upon the three bodies who represent these interests, Parliament, the Metropolitan Board, or whatever body may represent the whole metropolis, and the Ecclesiastical Commission, in which body the estates of the Chapter of Westminster, now producing an immense revenue, are vested. It is then in a joint operation between the public, in its capacity of subscribers to a great and necessary and beautiful work, and the three bodies I have

named, that the ultimate solution of this difficulty may be looked for.

Lastly, it is to be observed that such a plan, involving as it would the clearing away of the houses in Old Palace Yard and Poets' Corner, would be one of the most splendid improvements that could be carried out in this part of London. It would open out the south side of the Abbey, and disclose to view the beautiful Chapter-house, now almost completely hidden. It is not many years since the north front of the Abbey, or a great part of it, was similarly hidden from view; old prints show that there was a row of buildings on either side of St. Margaret's Church, opposite to the old Law Courts, from Bridge Street to the Abbey. In fact the greater part of Parliament Square was covered with houses. These have all been demolished, and the Square has been completely cleared within the last thirty years. The Abbey now stands out in all its beauty on this side. The removal of the old Law Courts, and the opening to view of Westminster Hall effected during the past year, has been another improvement of the same kind.

It is not too much to say that the panorama of buildings now seen from a point at the end of Great George Street, near to the statue of Peel, is one of the finest in Europe. On the extreme right stand the Towers of the Abbey, then the whole range of its nave, transept, and Henry the Seventh's Chapel, against which St. Margaret's Church stands, not without advantage in breaking this long line, in supplying another tower, and in giving the means of appreciating the size of the Abbey. The Victoria Tower is then seen in full, down to its base, which was formerly scarcely visible from any point; then comes Westminster Hall, with its ancient buttresses, the contrast of whose simplicity and grandeur with the ornate frontage of the new palace, and with Henry the Seventh's Chapel, is very striking, and not ungrateful to the eye. The picture ends on the extreme left with the graceful Clock Tower. What can be more beautiful or more full of interest than this range of buildings!

Parliament Square will be further improved when the street leading to it is widened uniformly with Whitehall, as is now proposed, and when a handsome block of buildings is erected along the new line with a frontage to the Square.

Little will then remain to be done in this quarter, except to open out the view of the Abbey on its south side. The proposed monumental chapel, the Chapter-house, and the Abbey will then stand opposite to Barry's beautiful front of the House of Lords and the Victoria Tower, and the "place" on this side of the Abbey will be not less striking than that on the other side.

When the wealthy people of London rise to a conception of the dignity and beauty of the great city in which they live, and from whence many of them derive their great incomes, and of their duties as citizens, so far better understood and acted upon in other great cities, it is certain that this improvement will be one of the first which will be accomplished. The Abbey, with its wealth of monuments, the Hall, and the Parliament House of Westminster will then form a group worthy of this, the *μεγίστη* of the British Empire.

## THE PROPOSED RAILWAY UNDER THE PARKS.

THE following circular, issued at the instance of Mr. R. W. Perks, solicitor to the Metropolitan Railway Company, has been forwarded to all the trades and friendly societies, and has been put down for discussion by the executive councils at the principal working men's clubs during the coming week:—

I beg respectfully to call the attention of your society to a proposed extension of the Metropolitan Railway from Edgware Road and Paddington to Westminster, and to express a hope that the members of your society will support a project which is calculated so largely to increase the travelling facilities of the working classes of London. I should not venture to adopt the somewhat unusual course of directly appealing on behalf of the company I represent to the leaders of the trades societies of the metropolis were not a vigorous effort being now made in certain quarters completely to mislead the public as to the character of the proposed railway, as to the conditions under which it is to be made, and as to the feeling of the working classes of the metropolis with respect to it. During the last twenty years the Metropolitan Railway Company (irrespective of the District Railway Company) have conveyed over their lines upwards of 900,000,000 passengers, and are now carrying 72,000,000 every year, of whom nearly 80 per cent. are third-class passengers. The average price per passenger of all classes together is under 1*½d.* per journey. The proposed Extension Railway will be three miles long. Commencing at Paddington, it will pass under the Edgware Road to the Marble Arch, Hyde Park, where there will be a station. Thence the railway passes at a very considerable depth below the surface—of course in tunnel—to Albert Gate, Knightsbridge, where there will be another station. The line then passes, still under tunnel, under a portion of the Knightsbridge Road, and thence beneath Hyde Park Corner, underneath the Green Park and St. James's Park, to Westminster. It would be impossible to select any other route for the construction of a direct north and south route through the western half of the metropolis which would during construction

cause less inconvenience to the public, less interruption of traffic, and less destruction of property. The more economically a railway can be made, the greater are the advantages to the travellers using it in lower fares and better accommodation. The conditions under which the railway will be permitted to be made beneath the parks have been very carefully framed by the Government. Ventilators or openings in the parks are prohibited. The railway is to be made at such a depth as to prevent vibration. Care has been taken to avoid the trees. The railways are to be made in winter months. In Westminster the company have, in connection with their terminal station, to carry out public improvements which, if undertaken by the Metropolitan Board of Works, would alone cost the ratepayers of London at least 200,000*l.* They propose to widen Parliament Street to a line with the Foreign Office, to widen and improve Charles Street, make a new and wider street in place of King Street, and construct a new one parallel with Great George Street. The company propose to expend upwards of one million sterling, the greater portion of which will be expended in works and wages. The new buildings which will subsequently be erected upon the lands at Westminster will probably involve an additional expenditure of upwards of 600,000*l.* for work and material. In view of the above facts, the working classes of London will, it is hoped, support this important metropolitan improvement, and secure for the people new, rapid, and cheap means of locomotion.

### THE TIMBER OF LEBANON.

TWO inscriptions have been lately found on Lebanon by M. Pogon, Assistant-Consul of the French Republic at Beyrout, of which M. Clermont-Ganneau gives an interpretation. They are engraved on the rock in one of the wildest valleys, and measure about 5½ metres in breadth by 2.8-10ths in height. Each one is accompanied by a basso-relievo. That of the first inscription represents a personage with the Assyrian tiara as head-dress, turned towards the left, and seizing an animal standing erect on its hind legs, possibly a lion. Behind this personage there must have been the image of a divinity; it has completely disappeared, but one can still read underneath:—"To the goddess. . . Who exalts. . . Who inhabits the temple of Goula, the temple. . ."

The basso-relievo of the second inscription represents a man in adoration before a tree, with a rather curiously-shaped pointed cap on his head, somewhat similar to the mitre, closed at the top, which is worn nowadays by bishops.

The two inscriptions each contain a different text. They commence by the titles of Nebuchadnezzar:—"Nebuchadnezzar, King of Babylon, the Illustrious Pastor, the servant of Merodak, the great Lord, his Creator, and of Nebo, his illustrious son, whom his Royalty loves."

The two inscriptions do not comprise any historical passage. The king merely gives an account of the buildings he is having constructed in Babylon.

M. Pogon is of opinion that these texts mark the site of a timber-yard, where trees were cut to be sent to Babylon. The name of Lebanon is repeated several times in mutilated sentences, where it is a question as to the wood employed in Nebuchadnezzar's buildings.

M. Clermont-Ganneau considers the supposition to be very probable. In the first place, we are aware, from the other inscriptions of Nebuchadnezzar which have reached us, that the great King of Babylon employed a considerable quantity of wood for his sumptuous building of temples and palaces. In one of these inscriptions, preserved in the British Museum, he even says expressly "that he has employed for the woodwork of the Chamber of Oracles the largest of the trees which he has had conveyed from Mount Lebanon." At all times, moreover, Lebanon appears to us as an inexhaustible source of building timber. Everyone remembers the timber—cedar and fir—cut in Lebanon and sent by Hiram, King of Tyre, to David and to Solomon for the construction of the Temple and the Royal Palace at Jerusalem.

The prophets show us, on different occasions, the forests of fir trees covering the slopes of this celebrated mountain as the "Glory (*Kabod*) of Lebanon." It is from Lebanon that the Phœnicians, and after them the conquerors of Syria, obtained the materials for their naval constructions. Lebanon, which had in this respect furnished precious resources to Alexander and his successors, played the same part until the Roman epoch. All that part of High Lebanon comprised between Sannin and the Pass of the Cedars, in the middle region of Toula, as far as Semar Jebel, is still covered with hundreds of Latin inscriptions, engraved on the rock, and reserving for the State, as M. Renan has shown perfectly, in the name of the Emperor Hadrian, the four species of trees necessary, according to Vegetius, for the requirements of the Imperial fleets—the pine, the larch, the fir, and the cedar (*Imperator Hadrianus Augustus: arborum genera iv.; cetera privata*).

It is curious to compare this epigraphic document with a verse of Isaiah (lx. 13), which appears to offer a striking similarity to it—"The glory of Lebanon shall come unto thee, the *berosch*, the *tidhar*, and the *teashour* together, to beautify the place of my sanctuary." The *berosch*, the *tidhar*, and the *teashour* (the

improbable box of the Authorised Version) seem designated as four resinous species, upon the botanical identity of which there is a difference of opinion. Add to these three trees the cedar comprised in the parallelism, under the usual metaphor of the glory of Lebanon, and we obtain the very four species which are mentioned in the inscriptions of Hadrian and correspond with those enumerated by Vegetius.

It may not be impossible that the two inscriptions of Nebuchadnezzar may be referred, at an interval of several centuries, to a similar order of ideas, and concern in all or part the preservative measures taken by the king for the forests, whose working was the privilege of the Crown. Nebuchadnezzar is not, moreover, the first foreign conqueror who has utilised the riches of Lebanon. On the basso-relievos of the bronze gates of Ballawat, one sees the Assyrian soldiers of Shalmanazar II. carrying down beams of cedar wood from Lebanon. We know, from other sources, that this king, after having received the tribute of Tyre, Sidon, and Gebal, had his statue erected in Lebanon, where he had been to get cedar wood on the mountain of Bahli-Rashi. It is perhaps also in the neighbourhood of Hermel, and not, as was thought, at the mouth of the Dog River, that it would be advisable to seek the monument of Shalmanazar II. executed on this occasion.

One might easily multiply these comparisons borrowed from the Assyrian documents, such as the inscription of Assurnatzir-Pal, discovered at Ballawat by M. Rassam, and recently studied with success by Mr. E. A. Budge. One may read at the lines 24-27, "To the land of Lebanon I went; beams of cedar (*erini*), *surman* wood, cypress wood (*dapran*) I cut down." However that may be, the inscriptions and basso-relievos of Nebuchadnezzar are worthy to be put beside the well-known monuments left in Syria by the Assyrian and Babylonian conquerors, as testimonies of their passage through Phœnicia, not far from there, in the valley of the Dog River, north of Beyrout. The discovery of M. Pogon proves that Lebanon has not yet said its last word, and that an accurate exploration of this vast tract of mountains would, perhaps, produce new and still more valuable discoveries of the same kind. We must not forget that there remains to be found, among other things, the great Phœnician sanctuary, where the mountain, itself deified, was adored under the name of Baal-Lebanon. The existence of this topic Baal is attested by the bronze cup dedicated to him by a *soken* of an undetermined city, namesake of the classical Carthage, a personage whom M. Clermont-Ganneau formerly demonstrated to have been a high functionary of Hiram, King of the Sidonians.

### ARTISANS' DWELLINGS.

AN important letter has been addressed by the Secretary of the Local Government Board to the Clerks of the Vestries and District Boards of the metropolis. After enumerating the various statutes which have reference to artisans and labourers' dwellings, the letter next explains the procedure that is to be adopted for the abatement of nuisances. The letter then continues:—"With regard to the Artisans' Dwellings Acts, 1868 to 1882 (Mr. Torrens's Acts), I am directed to state that the primary object of these Acts is to secure the improvement or demolition of houses which are "in a state dangerous to health, so as to be unfit for human habitation," but they also empower the local authority to deal with any "obstructive building"—*i.e.*, a building which, although not in itself unfit for human habitation, is so situated that, by reason of its proximity to other buildings, it stops ventilation, or otherwise makes or conduces to make such other buildings to be in a condition unfit for human habitation, or prevents proper measures from being carried into effect for remedying the evils complained of in respect of such other buildings. Under these Acts, on the report of the medical officer of health that any premises are unfit for human habitation, the authority are to ascertain from a surveyor or engineer whether the causes of the evils can be remedied by structural alterations and improvements, or whether the premises ought to be demolished. In the former case the authority are empowered to require the owner to execute the necessary structural alterations, and, on default, they may order the closing or the demolition of the premises, or may themselves execute the necessary works at the expense of the owner. If the report of the engineer or surveyor is to the effect that the premises should be demolished, they may order the demolition of the premises, and, on default of the owner, may themselves take down and remove them. The authority may in like manner require the removal of an "obstructive building," as defined above. When, however, an order is made on an owner for the execution of works or the demolition of a building which is unfit for human habitation, the authority may be required by him to purchase the premises. Where the authority thus acquire lands, they or their lessees are to hold the property on trust, first, for providing the labouring classes with suitable dwellings within the jurisdiction of the authority by the construction of new buildings or the repairing or improvement of existing buildings; and, secondly, the opening out and widening of closed or partially closed alleys or courts inhabited by the labouring classes, by pulling down any building or otherwise, leaving such open spaces as may be necessary to make the alleys or courts healthful.

As regards the Artisans and Labourers' Dwellings Improvement Acts, 1875 to 1882 (Sir R. Cross's Acts), the Board directs me to state that, although under these Acts no duties are expressly imposed on the authority (the Metropolitan Board of Works being the authority under these Acts in the metropolis, except in the City of London), the Board think it right to draw attention to their provisions, as it devolves on the medical officers of health of the vestries and district boards to make the official representations on which the improvement schemes are based. The Act of 1875 recites:—"That various portions of many cities and boroughs are so built, and the buildings therein are so densely inhabited, as to be highly injurious to the moral and physical welfare of the inhabitants; that there are in such areas a great number of houses, courts, and alleys, which by reason of the want of light, air, ventilation, or of proper conveniences, or from other causes, are unfit for human habitation, and fevers and diseases are constantly generated there, causing death and loss of health, not only in the courts and alleys, but also in other parts of such towns: that it often happens that, owing to the above circumstances, and to the fact that such houses, courts, and alleys, are the property of several owners, it is not in the power of any one owner to make such alterations as are necessary for the public health; and that it is necessary for the public health that many of such houses, courts, and alleys should be pulled down, and that such areas should be reconstructed, and that, in connection with the reconstruction of those areas it is expedient that provision be made for dwellings for the working-class who may be displaced in consequence thereof."

This Act and the amending Acts, it will be observed, contemplate the dealing with whole areas when the houses are so structurally defective as to be incapable of repair, and so ill-placed, with reference to each other, as to require to bring them up to a proper sanitary standard, that they should be demolished and reconstructed.

With regard to the Labouring Classes Lodging-houses Acts, these Acts provide the means by which any parish with a population of 10,000 persons, or two or more neighbouring parishes, in combination, having an aggregate population of not less than 10,000 persons, may constitute Commissioners for the purpose of providing lodging-houses for the labouring classes. The Commissioners may purchase or rent land, and on such land erect buildings suitable for lodging-houses for the labouring classes, and convert any buildings into lodging-houses for the labouring classes, and may alter, enlarge, repair, and improve the buildings, and may fit up, furnish, and supply them with the requisite furniture, fittings, and conveniences. The Commissioners may also contract for the purchase or lease of any lodging-houses for the labouring classes in their parish, and may appropriate the houses to the purposes of the Acts with such additions or alterations as they deem necessary.

It will be seen from the foregoing statement that the local authorities have already large powers vested in them for dealing with insanitary dwellings of the labouring classes, and the Board desire to impress upon the authorities the responsibility which consequently attaches to them, and to urge them, by a vigorous exercise of the powers with which they are entrusted, to secure an improvement of the dwellings of the class to which attention has recently been directed.

Sir R. A. Cross contributes an article to the *Nineteenth Century* on the subject, in which he says:—"What then is the sum and substance of the whole matter? First, as to new buildings, we must take care that houses in future shall be properly built in the first instance, and strictly enforce the Metropolitan Building Acts. This is a matter of administration of existing law. As a matter of legislation, strengthen these Acts if necessary, and without delay give like powers to local authorities in the suburbs. Secondly, as to the maintenance, &c. Houses though properly built will soon become a nuisance if not properly maintained. Property has its undoubted rights. As a first principle of justice let these rights be properly protected. Property has also its undoubted duties; let us take equal care that these duties be properly performed. Mr. Chamberlain is right here when he says, "After all that has been said it remains certain that much more is capable of being done under this legislation than has yet been undertaken, and it will be the duty of the departments concerned to use the power conferred upon them to repair the supineness of the local authorities where these can be shown to have neglected their obligations for this purpose. However, the Government must have the hearty and consistent support of public opinion. The sanitary provisions of the law must also be duly enforced against occupiers as well as owners. This is a matter of administration only, fresh legislation is not needed. Thirdly, as to old buildings. The old slums and insanitary houses must be got rid of—as economically as may be done, certainly—but they must go, the sooner the better, but only with convenient speed, or overcrowding will most certainly follow. The neglect of many years cannot be repaired in one. On this general head his answer is administration, not fresh legislation. Lastly, as to the question of rehousing. No legislation is here wanted. What is wanted is patience, perseverance, determination, firmness, so that these people may never be taught to forget that they must rely upon themselves, and encouragement in every legitimate way to those who are willing to invest money at a fair but moderate rate of interest. Among local

authorities themselves let us hope that there may be found willing and ready hearts, men alive to all the necessities of the case and earnest in pressing forward measures of administration necessary for the work, with energy and never-flagging exertion, though with prudence. Let us also hope that among the general public some may be found willing to join hand with hand and to stand shoulder to shoulder with the object of pressing on the work wherever work is needed. And above all, let us hope that many will thus work with the express object of making the people who live in these miserable dwellings feel that there are those who really care for them. These people are to be won, and they are worth the winning, and those who help to win may rest assured that they themselves will in the largest, highest, noblest sense as surely gain.

### SIR JOSHUA REYNOLDS.

THE following character of Sir Joshua Reynolds by his friend William Jackson may have interest at the present time, when so many of the artist's works have been brought together. It appeared soon after the artist's death:—

Sir Joshua had the reputation of being a man of genius and knowledge, in his profession and out of it—to deny this would be absurd, but our assent must not be an implicit faith. I will first inquire into his merits as an artist, and then as a man of general science.

He began his profession as a portrait-painter, and his works were soon distinguished by an elegance of design that had not been seen in England since the time of Kneller. To balance this excellence, his likenesses were frequently defective, and his colouring cold and weak—but this must be considered only as the general character of his performances at that time; for even in his earliest days, there were instances of his producing pictures of considerable merit.

A very few years had elapsed, before it was observed that his pictures were changed from their original hue, and the change in some was so great as to occasion a belief that the colours were gone off. Persons who are ignorant of the mechanical part of painting, reported that Reynolds knew not how to fix his colours, and that his pictures in a short time would cease to exist. As this matter has never been understood, I will stop a moment to explain it.

The dead-colouring of his pictures at this period was little else than flake, Prussian blue, and lake. All the laying-in consisted of these three tints. When the picture was quite dry, he gave it a warm glaze, which supplied all that was originally wanting, and produced a harmony in the whole, which was very agreeable and seducing to the eye when fresh done, but after a while the drying-oil (sometimes exchanged for varnish) with which the pictures were glazed turned dark, and by degrees grew more and more obscure, until the effect was as bad as if they had been covered with a dirty piece of horn. There are great numbers where the face can scarce be distinguished, and where the drapery is entirely hidden with this brown crust.

The colours then, are not gone off, but imprisoned—they are obscured beyond the reach of art to restore; and all pictures of this description will continue to grow worse and worse until the change of the oil, or varnish, has attained its maximum. This practice (of depending so much upon glazing) occasioned the painters to whisper that Reynolds did not paint *fair*, and that he dealt too much in trick. I dare say that the severest censures came from himself, and he at last grew tired of a practice which he knew must obstruct his progress to fame, and began, at last, to paint *honestly*.

The first picture that I recollect, after this change in his manner, was the portrait of the Lord Primate of Ireland—admirable in every respect. It was followed by many others truly excellent; and he continued in this style for many years.

As he possessed some pictures of Rubens, and might see as many as he pleased, it was difficult not to be seduced by their splendour. I once heard him say, "that a single picture of Rubens was enough to illuminate a room!" There is something like an emanation of glory from a fine picture of this master, which is felt and adored by a kindred genius. In one of the churches at Antwerp is a picture of Rubens, at the High Altar, which seems to be seen by its own light, at the farther end of the church. This magic of colouring was the favourite pursuit of Sir Joshua for the last ten years of his life; but, like other eager pursuers, he was not always in the right track. He may surely be supposed wrong, when, to obtain force, he loaded his lights with so great a quantity of colour that the different layers and touches frequently separated from the ground, merely by their weight.\* This excess he wisely abandoned, and long before his death he considered pictures, not as models, but surfaces.

It was at this period of his practice that he introduced the red

\* I once heard him *blessed* by a housemaid, who said (wiping the floor) "that the stuff which was always falling from that great picture made the room in a perpetual litter! I wish it would all come down at once!"

shadows of Rubens; which, though unnatural, are the chief cause of the splendour of the pictures of that master. Gainsborough once dealt in red shadows; and as he was fond of referring everything to nature, or where nature was not to be had, to something substituted for it, he contrived a lamp with the sides painted with vermilion, which illuminated the shadows of his figures, and made them like the splendid impositions of Rubens.

After Sir Joshua had abated something of the violence of these shadows, he was in the zenith of his art. It was at this period he produced his *Venus* and the *Death of Cardinal Beaufort*, which will make his name equal with the greatest masters. Of the *Venus* there is a duplicate with some small variation. The colouring is at least equal to Titian, but much superior to that painter in elegance of design. The *Cardinal Beaufort* has a warm glaze, which is rather too apparent.

He had tried, if not *all* things, yet, *many* things, and held fast those which were right—but in one circumstance he was ever wrong. In common with Vandyck, and a host of other painters, he had two, and sometimes three different points of sight in the same picture. I have elsewhere \* demonstrated the falsity of this practice in a scientific view, and its ill effect in every sense. A whole-length portrait of a child, with an horizon no higher than the ankles, gives one the idea of an infant as tall as a steeple, which is discordant and ridiculous—one of his prettiest pictures was a child with such an horizon.

† The above observations on colouring apply equally to his portraits and histories. The first historical subject, in point of time, that occurs to me, is *Garrick between Tragedy and Comedy*—which is a modernising of Hercules between virtue and pleasure. It was painted long before the reformation in his colouring; but, notwithstanding that disadvantage, it is so perfect in all other respects, that it must be considered as one of the happiest efforts of his pencil.

It is not my intention to enter upon a criticism, or even catalogue of his performances, or indeed to mention any picture, unless it contains some peculiarity by which a more correct judgment may be formed of his skill, or the want of it. Suffice it then to say, that there are trifling defects in most of them, which an ordinary genius might have avoided, and transcendent beauties, which few, perhaps none, could have reached but himself. The *sketch* † of the infant Hercules I have ever considered as the first production of his pencil, and the greatest effort of modern art.

He frequently painted historical portraits—one of the best is that of Mrs. Siddons in the character of the Tragic Muse—it has grandeur in the conception and execution—but the sublimity of this picture is much abated by the abominable chair, which is so ugly and discordant, as to force our attention to such a subordinate circumstance; nor is that the worst, for one of the odious knobs cuts the line of the arm, and substitutes a disagreeable break, where everything should be broad and grand. I very much dislike the effect of the chair in the King's portrait at the Royal Academy; although it be the coronation chair, we should observe that when the King sat in it the whole was richly covered; as a plain chair, it is scarcely good enough for a country barber's shop, where I heartily wish it had been sent before the imitation occurred, which has so much hurt this capital performance.

In one of his early historical portraits, the idea seems to be a reproach instead of a compliment; he painted Lady Sarah Lennox as sacrificing to the Graces. A little examination of the subject will, I believe, show that it was a wrong conception. A poet once carried his verses to a friend (says Addison, from whom I take the story) who returned them with advising him "to sacrifice to the Graces"—plainly insinuating that he thought his poetry destitute of elegance, and that he should endeavour to propitiate the deities who were unfavourable to him; the application is obvious.

About the beginning of this century was a painter in Exeter called Gandy, ‡ of whose colouring Sir Joshua thought highly. I heard him say that on his return from Italy, when he was fresh from seeing the pictures of the Venetian School, he again looked at the works of Gandy, and that they had lost nothing in his estimation.

It has been observed that Sir Joshua was shy of painting feet, and seldom ventured beyond the toe of a shoe peeping out from a petticoat—there is some reason for this remark—but many things might be offered to excuse, though not sufficient to defend the practice.

There are fewer drawings by this great artist than by any other of eminence. Perhaps, prevented by more important occupations,

\* In the Thirty Letters.

† I call it a sketch, because it was evidently a study for the great picture, but it was complete in every respect. Surely one of the grandest characters that ever mind conceived, or hand executed! If the rest of the figures had been only a woman or two, and in the same style, the infant would have kept its consequence, which is now lost amid a group of figures that offend probability, and destroy the effect of the picture.

‡ There are many pictures of this artist in Exeter and its neighbourhood. The portrait Sir Joshua seemed most to value is in the Hall belonging to the College of Vicars in that city, but I have seen some very much superior to it.

or for want of early practice, he might not possess the faculty of producing effect by chalks, washing, penning, or any other of the numberless methods by which drawings are made, the great merit of which consists of effect quickly produced. This facility cannot be attained, however good our ideas may be, without immense practice. Gainsborough was for ever drawing, and had this facility; but there are not many proofs that, in this sense, Sir Joshua drew at all.

His judgment of pictures differed from connoisseurs in general; was peculiar, and his own. Very moderate ones (to the common judge) he has spoken highly of; and very good ones (upon the usual principle) he has much undervalued. His own collection (with some illustrious exceptions) and the little attention paid to Ralph's exhibition, seem to justify this remark. Fifty quotations from as many different authors will never make the *Joconde* of Leonardo da Vinci worth fifty pence—the same may be said of the *Leda* of Michael Angelo, and of many others which wanted other requisites to make them of value. But it should be observed that an artist frequently buys a picture for its possessing something that is of use to *him*, and which is undiscernible by the common eye—and this accounts for his having many pictures, the merit of which was only known to himself.

It was not apparent that Sir Joshua was a scholar, in the usual acceptance of the word, but his conversation and writings showed a mind strongly tinctured with modern literature and refinement. There is much ingenuity and originality in all his academic discourses; perhaps there would have been more of both, if he had dared to shake off the fetters in which long literary slavery has confined us. Where he has done so, as in his Notes on Fresnoy, and his Eloge on Gainsborough, it is evident that he could think, and think justly, for himself. His style is simple and unaffected, and perfectly expressive of his ideas, which, in fact, is saying everything. Those who thought his discourses had been corrected by Dr. Johnson, were absurd in the extreme. Sir Joshua knew perfectly well that Johnson was the last man in the world for such a purpose, and, besides, must be confident that he himself was fully equal to the expression of his own thoughts. Johnson and Sir Joshua, it is true, were intimate friends; but they were as unlike in everything as two sensible men could be. This matter admits of proof—their writings bear not the least resemblance to each other in subject, manner, or style.

Whatever defects a critical eye might find in his works, a microscopic eye could discover none in his heart. If constant good-humour and benevolence, if the absence of everything disagreeable, and the presence of everything pleasant, be recommendations for a companion, Sir Joshua had these accomplishments. His unfortunate deafness occasioned a practice of loud speaking at his table, which to those who were unused to it was very unpleasant; but it was, notwithstanding, the constant resort of the first people in England for rank and talents, by whom Sir Joshua was esteemed and beloved, and this is the utmost to which man can attain. The great, the wise, the ingenious, and the good, ever considered it as an honour to be known as the friends and intimates of Sir Joshua Reynolds.

#### Royal Institute of British Architects.

SIR,—In your current number you allude to the changes to be proposed at the Institute on Monday next. Would you allow me to inform your readers that the suggestion I have to offer is, that of the fifteen elected members of Council not more than twelve should be eligible for re-election, so that on the list of votes any old members in excess of twelve would be passed over in favour of new members?

This, while it avoids "the enforced retirement of members of Council annually by rotation," will place on that body each year three members who have not served during the previous year.

I am, Sir,

Yours obediently,

LACY W. RIDGE.

7 Upper Woburn Place, W.C.:  
January 3, 1884.

#### The Institute Council.

SIR,—On Monday night another attempt will be made to reform the Institute (for that is synonymous with a reform of the Council), and let us pray that it will be more successful than those of past years. I think it may be safely alleged that a more inoperative Council than the present never sat in Conduit Street. Can any one call to mind a single useful action that has been done by them during their term of office? They are not likely to hide their good deeds, and if they rendered service to the profession we should all hear of it without loss of time. It was with curiosity I

awaited the President's last address, in the hope that something might be discovered about the work of the Council. The address is curious as being a most astounding example of egotism; but what did it say about the year's work of the Council? That is easily answered. First, we were informed of an arrangement by which Scottish candidates for the Associateship may be examined in Glasgow; secondly, it was related that there was some correspondence with the Manchester Society about voting by ballot; and, thirdly, there was an account of an interview with a few members about the constitution of the Council. In those three facts we have apparently the sum total of the Council's activity. If nothing else was described, I think it may be concluded that it was because nothing else was done, and the Institute may well be amazed at such an exhibition of zeal. Small as it is, I believe it exceeds last year's work.

When I turn to my copy of the "Transactions," I find that it also testifies to the do-nothingness which prevails among the Council. If the opening address and the address on the presentation of the gold medal are excluded, there remain twelve papers. What part did the Council take in the preparation or the discussion of them? Mr. P'Anson, Vice-President, composed one, and offered a few remarks on another paper. Mr. Christian spoke once, and that was all. The laborious exertions of the Council will be more evident by applying a foot-rule to the volume. It contains in all one hundred and twenty-six pages. We are indebted to the President, Vice-President, Council and Secretaries, for contributing between them twenty-one pages, including the Presidential addresses, or nine pages if they are excluded. Is it right that such a state of things should be allowed to go on?

I fancy I am not the only member who believes that if there is to be reform it must be a thorough one, and that tinkering will not do now. It is absurd to expect that the introduction of two or three new members of Council will remedy the lethargy which in a mysterious way appears to be transmitted from one Council to another. Why should not the whole Council retire? It may be objected that new men would be ignorant of the traditions of the Institute; but that is nonsense. There are no mysterious secrets bequeathed from the past, and ordinary business men would be competent to take part in the work of the Council without coaching. A more important difficulty is the position of the provincial members. Two of them, I understand, have taken little interest in the efficiency of the Institute since they were elected, but the others have endeavoured to do their duty under great difficulty. But for the sake of the Institute it would be better if the latter agreed to a temporary absence from the Council. Better representatives than Mr. Worthington, Mr. Frazer and Mr. Honeyman could not be easily found, and they are pretty sure to be elected hereafter. At present representatives of the provinces are unable to attend all the meetings, although their presence is indispensable. Would it not be wiser at the present juncture if Liverpool, Manchester, Leeds and Glasgow selected local men who have settled in London to represent them on the Council, even if the arrangement were only temporary? The influence of the provinces should count for much in the arrangements that are likely to be made.

In the new Council it would be well to have some of the men who have guided the Architectural Association to its present position; and as it will be no easy task to overcome officials who would preserve the existing state of things, a man or two disposed to be combative would be an acquisition. The reform of the Institute will never be accomplished by elegant nonentities. I observe that the present juncture has called forth advice from Professor Kerr. He may desire to have a share in the government, but he is never likely to be gratified. Prudence of a very different kind to his is now needed at the Institute.

Yours obediently,  
A PLAIN SPEAKER.

#### Christmas Cards.

SIR,—In your "Notes and Comments" of December 29, 1883, your date "as to the origin of the custom of sending Christmas cards" is seriously at fault, inasmuch as I have used them yearly since about the year 1842, when I bought some for the first time of ever seeing anything like them—in fact, I had never heard of or seen such a thing as a Christmas card. I bought a quantity—some coloured and some in outline only. The coloured were one shilling, and in outline sixpence each. The design was a family group having a Christmas dinner, showing the *paternal* at the head of the table with a glass of "port" in his hand, as he stood to propose "A Merry Christmas and a Happy New Year." I have written for information as to the author and publisher. Should I succeed in getting the names, I will send them that you may publish them if you think well to do so.

1 Manor Place, Sunderland : MARTIN GREENER.  
Dec. 31, 1883.

#### The Government Art Schools.

SIR,—May I be allowed, in answer to your correspondent "A Young Artist," to express the great disgust I feel for the crude and undigested remarks he makes about the badness of everything artistic as practised in England.

As a practical teacher of art in every branch, and to all sorts of people, both by the Government system, and, in deference to private requirements, by a system of my own, I deny that the Government system has been barren, but, on the contrary, it has been productive of all sorts of good to all sorts of people, and my impression is that "A Young Student," not being himself very capable or persevering, has got discouraged at the severity of the training imposed by the South Kensington system, which is not made up of stipple and time, but of painstaking industry, and completeness of study, without trick or conventionality. This is not a vague statement of mine. The facts are being practically stated every day in all the schools of art in the kingdom.

I am, Sir,

Your obedient Servant,  
HERBERT GILBERT.

Lancaster School of Art :  
Dec. 26, 1883.

#### NEW BUILDINGS.

**Newcastle-on-Tyne.**—New premises in Newgate [Street, recently erected for Messrs. Wilkinson & Simpson, wholesale chemists of this city, in place of those destroyed by fire on August 22, 1882, have been completed, and business was resumed there with the New Year. The front to Newgate Street is designed in the Queen Anne style, and executed in red Sussex bricks and Prudham stone. The building depends for its effect on the treatment of its proportions, colour, and refinement in detail. Mr. Edward Shewbrooks, F.R.I.B.A., of 2 Market Street, was the architect, under whose superintendence the whole of the work has been carried out.

**Liberal Club, Delph.**—The new Reform Club was opened on December 27. The building is designed in the late Gothic style of architecture, and has a very imposing and somewhat pleasing effect. The front entrance to the club is by a vestibule, which is screened off from the hall by double-hung doors, the upper portion being filled in with embossed glass. On one side of the hall is the billiard-room, amply suited to its purpose, and on the other the committee-room and news-room, both of equal size, all three rooms being laid with wood block paving, which is noiseless, and is not subject to dry rot. At the rear of the premises are the club keeper's apartments, also the heating chamber. The ascent to the assembly-room is by a broad flight of stairs, and on the middle landing is the staircase window, filled in with two coloured margins of a rich blue, affording ample light to the back portion of the club. The assembly hall, the internal dimensions of which are 45 feet by 26 feet 3 inches, is of fine proportions, the roof being ceiled half-way up the spars, thus giving more height to the room. The room is enhanced by two fine stained-glass windows, representing "Peace and Plenty," these being placed in the upper portions of the front centre window. A retiring-room is provided, fitted up with lavatory and other conveniences, and may be entered direct from the main staircase. On the second floor are the clubkeeper's sleeping apartments, these being partly obtained out of the roof. Special attention has been directed to the ventilating and heating of the building. The heating apparatus has been provided and fixed by Mr. R. R. Gibbs, Liverpool. Generally the exterior of the building is faced with Yorkshire parpoints, relieved with tooled stone dressings, the front of the building being enhanced by a well-proportioned balcony, in the soffit of which are carved the initials "P. R. R." for Peace, Retrenchment, and Reform. The erection of the building has been ably carried out by local contractors, the following being the list:—Brickwork and masonry, Mr. C. Winterbottom; carpenters' and joiners' work, Mr. T. Wood, Delph; plastering and painting, Messrs. Whitehead Brothers, Dobcross; plumbing and glazing, Mr. Hudson, Uppermill; slating, Messrs. Shaw Brothers, Delph; wood blocking, Messrs. Andrews & Company, Manchester; lead lights, Mr. Swainebourne, Birmingham. The building has been erected from designs prepared by and under the superintendence of Mr. A. Banks, Rochdale Road, Oldham.

**Wolverhampton.**—The memorial stone of a Hospital for Infectious Diseases has been laid. The building is being erected from the designs of Mr. G. E. Thoms, and will consist of six blocks, upon an area of more than three acres. Four of the buildings are hospital pavilions, and will accommodate forty beds. The estimated cost of the whole is 8,000*l.* The portion now in course of erection is, however, to cost only 3,250*l.* The builder is Mr. Henry Clark.

**Liverpool Zoological Gardens.**—The occasion of the "turning of the first sod" of this undertaking was celebrated by a dinner at the Queen Anne Hotel, Walton, on the 28th ult. Mr. Millward, the Company's manager, and Mr. Kitchen, the secretary, acted as chairman and vice-chairman, and were supported by several shareholders, the contractors, the architects, Messrs. Sugden & Son, Mr. John Shaw, the landscape gardener, and other friends. Mr. Millward gave a brief statement of the very encouraging progress which had been made, of the considerable works actually in hand and those contemplated, and being matured for early execution by the directors and their architects. After Mr. W. L. Sugden had

exhibited and explained the designs for various buildings and their general grouping, Mr. Shaw addressed the company, giving an outline of the general landscape effect he hoped to produce. The customary toasts followed, and brought to a close a practical and business-like, but very enjoyable meeting.

**Clitheroe.**—St. Mary's Parish Church Schools were opened last week by the Mayor. The building is two storeys high, having the principal entrance in Church Street. The lower floor, approached from York Street, contains a schoolroom 46 feet by 44 feet 6 inches; two classrooms, 18 feet 6 inches by 10 feet, and 14 feet by 13 feet 9 inches respectively; a vestibule, cloak-room, lavatories, and closets. Adjoining is a kitchen, fitted with boiler and fire-range for tea-meetings. All these rooms are 17 feet in height. In the basement is a vault for the heating apparatus and fuel store. Above the classrooms, and approached from the vestibule and also from the upper schoolroom, is a room 44 feet 6 inches by 14 feet, for parish and other meetings. The upper floor contains a schoolroom 75 feet by 45 feet, four classrooms, varying in size from 23 feet 6 inches by 18 feet 6 inches, to 15 feet 9 inches by 15 feet, the largest being divided by wood revolving shutters. This floor is entered from Church Street by a wide vestibule paved with tiles, and having cloak-rooms and lavatories on each side. A wide stone staircase connects the upper and lower schoolrooms. At one end of the schoolroom is a large platform. The upper schoolroom has an open timber pitch-pine hammer-beam roof, with crossed principals and perforated spandrels. The external walls are built with Yorkshire parpoints, with Grindleton and Waddington Fell dressings. The gable towards Church Street is surmounted by a lofty bell-tower. The roofs are covered with Welsh slates, in blue and red bands, and the ridge is covered with red ornamental tiles. The windows to the Church Street front are glazed with rolled Cathedral plate-glass in varied tints, and the remainder of the windows with rolled plate-glass. The heating is by means of hot-water pipes and coils on the low-pressure system. Three of the classrooms have open fireplaces, and the ventilation is by means of flues under each window-bottom, and hopper ventilators in the windows. The work has been carried out under the supervision of William S. Varley, F.R.I.B.A., architect, Blackburn.

### SCHOOL BUILDINGS.

**Gosforth.**—New Sunday-schools in connection with the United Methodist Free Church were opened on Christmas Day. The schoolroom is 47 feet long, 28 feet wide, and 20 feet high to the ceiling above the collar-beams; the roof couples are of pitch pine varnished; and the walls are lined with stained and varnished boarding to a height of 4 feet 6 inches from the floor, and finished above with stucco, tinted cream colour, with a moulded wood cornice to the ceiling. The schoolroom is warmed with hot-water pipes, and a coil is placed in the entrance lobby, so that, instead of the usual influx of cold air, there will be a supply of fresh warm air admitted on persons entering or leaving. Two class-rooms, each 16 feet long and 13 feet 6 inches wide, open out of the schoolroom. The whole of the buildings are finished with Kenton stone, and the roofs are covered with blue Welsh slates and ornamental red tile ridges. The work has been carried out by Mr. Matthew Robson, of Gosforth, from the designs and under the personal superintendence of the architect, Mr. Edward Shewbrooks, F.R.I.B.A., of Newcastle-on-Tyne. Messrs. Walker & Emly, of Newcastle, supplied the hot-water fittings.

**Grays Thurrock.**—New Board Schools erected from the designs of Mr. E. C. Allam, F.R.G.S., architect, of Romford, have been opened. The style chosen by the architect was a modified Queen Anne, and the school, which forms an extensive range of buildings, will accommodate 642 children. The centre of the range is occupied by the residences of the principal master and mistress. Mr. William Wood, of Chelmsford, is the builder.

### SANITARY WORKS.

**Drainage of Brentford.**—The new works for the drainage and disposal of the sewage of Brentford have just been completed at a cost of about 30,000*l*. The works have been designed by Messrs. Gotto and Beasley, engineers, of Westminster, and have been carried out by Messrs. Ford and Everitt as contractors for the general works, by the Staveley Coal and Iron Company for the iron pipes, and by Messrs. James Watt and Co. for the engines and machinery. The sewage is pumped from a collecting well in the town meadow to the sewage tanks on the Ealing road, a distance of more than a mile, and it is deodorised and precipitated by the mixture of lime and sulphate of alumina, the effluent water being discharged into the river by an effluent culvert along the line of Claypond's Lane. The sludge is dried by means of flues constructed under the tanks, and is run out by a small tramway.

**Evesham Waterworks.**—The works for supplying the borough of Evesham with water from the Broadway Hill, one of the Cotswold range, about seven miles distant, were opened on Tuesday,

and the event was celebrated with general rejoicing. The scheme of the undertaking was prepared by Mr. W. M. Landsborough, engineer to the Cheltenham Corporation, and it has been executed on the original lines and within the estimated cost, which necessitated a loan of nearly 12,000*l*. Messrs. Firmstone Brothers, of Stourbridge, Evans Brothers, of Wolverhampton, J. E. White, of Evesham, and Guest and Chrimes, of Rotherham, are the contractors who have been concerned in the work.

### GENERAL.

**The Huddersfield Fine Art Exhibition**, which was closed on Saturday, was visited during the time it was open by 329,190 persons. Financially the Exhibition has been a failure, the expenses having amounted to the large sum of 13,000*l*.

**Mr. A. Banks** of Oldham has obtained the first and third prize in the competition for plans for the proposed local Workhouse Schools. The second prize was awarded to a design by Mr. Wolstencroft of Royton. There were thirty seven competitors.

**The First Town** to be entirely lighted and have its tramcars driven by electricity will be Montreux, on the Lake of Geneva, a company having obtained a concession for the purpose. The motive power is derived from the water of the lake. Extensive works are to be erected immediately.

**A Carved Oak Pulpit** has been executed for Old Radford Church, near Nottingham, by Messrs. Jones and Willis. The same firm have supplied a stone and marble reredos to St. Andrew's Church, Netherton, from designs by Mr. Drinkwater.

**The Dorset County Museum** at Dorchester was opened on Tuesday by the Earl of Shaftesbury. His lordship spoke with some indignation of a proposal to remove Crosby Hall, London, and said that one effect of museums was to inspire greater reverence for the past. The building has cost about 7,000*l*. and the site was presented by Mr. R. Williams.

**The Paving and Flagging Works** carried out in the streets of Manchester during the past eighteen months amount to 394,000 square yards, or a total of 81 acres. The cost of the work has been 170,000*l*.

**The Church Extension Committee** of the Edinburgh Presbytery report that out of seven new churches projected in 1877, four have now been built.

**The Gas Committee** of the Manchester Corporation, in addition to the money already borrowed for the extension and improvement of the gas works, require a further sum of 200,000*l*., and it is intended that the section of the Act relating to borrowing powers should be amended by means of a provisional order so as to enable the amount to be raised.

**Messrs. Wailles & Strang** of Newcastle-on-Tyne have lately filled the east window of the parish church of St. Mary's, Rye, with stained glass, that has given great satisfaction to the vicar and parishioners. The cost has been about 550*l*.

**The Vicar of Horsforth**, near Leeds, has received, anonymously, a donation of 500*l*. for the parish church building fund.

**The India Office** has had estimates prepared for the fortification of Aden. The estimated cost is 100,000*l*.

**M. Edmond About**, who has lately visited Constantinople, says that the mosaics of St. Sophia are fast perishing. Cubes constantly fall or are picked out of the walls and sold to strangers.

**The Town of Wallingford, Berks**, has now obtained an abundant supply of water. Messrs. Le Grand and Sutcliffe have sunk one of their Artesian Tube Wells, 53 feet deep, 7 inches diameter, into the upper greensand formation, from which upwards of 100,000 gallons per day can readily be drawn. The operation of sinking this tube well occupied less than three weeks, and the supply can at any time be doubled by sinking a duplicate tube well. The engineer is Mr. W. A. Ripley, of Bracknell.

**Messrs. Stanley, Hall & Co.** have secured the contract for the whole of the constructional ironwork for the new Artisans' Dwellings now being erected by the City Commissioners of Sewers, Petticoat Square, amounting to 6,050*l*.

**The Silicated Carbon Filter Co.** have introduced a new filter which has the advantage of a movable block that can be cleaned, renewed, or repaired by the possessor; and on its removal the filter can be thoroughly cleansed. The new patent arrangement obviates the inconvenience attending the use of filters.

**Messrs. Measures Bros.** have issued a calendar for office use which contains tables of the sizes, weights and strengths of girders. In the centre is a sketch of the building in Cheapside after the fire in which Messrs. Measures' iron work alone remained uninjured.

**Mr. Alexander B. Sim** has become a partner in the firm of Messrs. Churchill & Sim, Clement's Lane, E.C.

**The Sanitary Paint Company**, Liverpool, are about to enlarge their manufacturing premises, to enable them to keep pace with the increase in their export trade.

**The Pulsometer Company** have just issued a new illustrated catalogue of their pumping machinery, which is now in daily use in this country and in the colonies.

# ELSLEY'S PATENT \* BALANCE SASH LEVER.

## ELSLEY'S PATENT BALANCE SASH LEVER AND WEATHER PROOF METAL SASHES

Are made in various qualities and are suitable for Public or Private buildings:  
The Sash Lever can be arranged to open long ranges of lights with an easy action not to be obtained by any other means.

Sections of Sashes & Casements ¼ Full size.

The following particulars should be sent with all Specifications for Estimates

- 1<sup>st</sup> Details of Mullions, Frames and Cills:
- 2<sup>nd</sup> Sizes of Sashes:
- 3<sup>rd</sup> Height of Sashes from Ground:
- 4<sup>th</sup> Description and Situation of building for which the work is to be used.

Thomas Elsley sole manufacturer of the Patent  
Balance Sash Lever

Portland Metal Works  
32 Great Portland Street  
LONDON. W.

## ELSLEY'S PATENT BALANCE SASH LEVER

Is an apparatus by means of which Top lights of Windows Skylights, Lantern lights &c can be easily opened or closed and securely fastened. The Lever or Handle and a small iron rod being adjusted in such a manner as to form a counter balance to the rising or falling sash gives an easy action unobtainable by any other means.

May be applied to Wood or Metal Sashes.

Weather proof Metal Sashes may be had in connection with the Sash Lever or otherwise.

Thomas Elsley sole manufacturer:  
Portland Metal Works  
32 Great Portland St.  
LONDON. W.

MAY BE APPLIED WITH ADVANTAGE IN SCHOOLS, HOSPITALS, PUBLIC OFFICES, ASYLUMS, FACTORIES  
AND OTHER BUILDINGS WHERE GOOD VENTILATION IS REQUIRED,

And as several Sashes may be opened with one action of the Lever or Handle and fixed in any desired position, the Supply of Air can be regulated with little trouble.

This Apparatus is used in place of Cords and Pulleys for Opening Windows. For all ordinary Top Lights over Sliding Sashes, School Windows, Skylights, Dormers, Lantern Lights, Greenhouses, &c., it may be applied with safety. The action of the Lever is so arranged that the weight of the Sash is made to balance against the Rod and Handle; this Balance enables the operator to open or close the Sash by an easy motion without danger to the Glass, the Sash being fixed in any position by means of a simple contrivance in the Handle. Thousands of sets of these Actions have been fixed, and in no case has a failure occurred, or a Broken Window given cause of complaint.

It supplies a Simple, Inexpensive, and Efficient Method of Ventilation for Schools, Offices, Hospitals, Workhouses, Asylums, Billiard Rooms, Conservatories, Stables, and all Buildings where good Ventilation is required.

The following is a List of some of the Buildings where this Apparatus may be seen in action:—

### SCHOOLS.

Anglo-German, Brixton

PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES AND WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards).

ORDINARY WAREHOUSE AND SCHOOL SASHES.

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## THE INSTITUTE OF ARCHITECTS.

UNUSUALLY important business was done at the meeting of the Institute of Architects which was held on Monday evening last. The assembly was what is technically called an "Ordinary (Business) Meeting," being one of the four quasi-private sittings *per annum* at which, under the new system of administration, the members are permitted to discuss the affairs of the Society; they being at all other meetings arbitrarily prohibited from touching upon anything whatever except a "paper" appointed by the Council to

be then read. In furnishing such a statement of the proceedings as the character of the meeting admits of, we may premise that it was understood that war was in the wind. The dissatisfaction which for years back has been fermenting in the Society, with reference to what is euphemistically called a "want of sympathy between the Council and the body," had broken out in a mild eruption, which eventually developed itself in this official form—"LACY W. RIDGE, Fellow, to move, in reference to the Election of the Council, That in the opinion of this Meeting it is desirable that some alteration in the composition of the Council should be made at each Annual Election." There are many who will scarcely be able to believe, in these liberal and constitutional days, that any set of gentlemen in England composing the mere managing board of a professional association could permit themselves to offer serious opposition to a proposal like this. But, as matter of fact, not only was serious opposition meant, but it had previously exhibited itself in a somewhat imperious way.

By an original fundamental principle of the Institute it has been always the rule that eight members may demand the convocation of a special meeting of the body to discuss a question set forth. Eight members, accordingly, not long ago, so demanded that a meeting should be called to consider the question of introducing from time to time new blood into the Council. Instead of submitting the memorial, however, to the constituency, the Council, according to recent custom, intercepted it as a private communication, and dealt with it by graciously inviting the memorialists, like a deputation of schoolboys grumbling against the masters, to attend and discuss the matter *in camera*. The end of it was an official announcement (upon which we commented at the time it was published) that the Council thought the alteration inexpedient. To understand this better, it is necessary to be told that, somehow or other, the house-list process of election has enabled the Council, throughout the whole history of the Institute, to constitute itself a close vestry if so disposed; so that the refusal to entertain the idea of new blood implied the belief that the apathy of the members at large might be calculated upon to enable the gentlemen now accidentally in power under the recently altered by-laws to retain their ascendancy and enjoy its privileges permanently. It was as a protest against such unconstitutional and disloyal presumption that the motion we have quoted was notified; and the contest evidently became one that required a little generalship on the part of the obstructive party.

The Council, therefore, seems to have first resolved to throw a tub to the whale. A change was determined upon with reference to the Presidency and Vice-presidency. The election of the late Mr. STREET in 1881, in open defiance of the Council, had shown that the apathy of the constituency had at least a limit in one direction; and it was now proposed by the Council itself, as a concession on that ground, that the scheme of succession to the chair and the three vice-chairs should be abandoned, and the nomination thrown open.

In preparation for the meeting, certain correspondence had taken place in the columns of a professional contemporary, whereby Mr. JOHN WHICHCORD, a "past president" under the new system, had been induced to expound the advantages supposed to have been derived from it. Mr. WHICHCORD's letter was a clever one, of course, but, diplomatically, it blundered in two important points. In the first place, the

most telling and readable part of it bore a little too plainly the appearance of an acceptance of the maxim cited by DICKENS, "No defence—abuse the plaintiff's attorney;" and secondly, and chiefly, the writer had walked into a trap, by committing himself, as one of the responsible originators of the new system, to a catalogue of its results for the opposition to pick to pieces. In fact, not in this alone, but in almost every other step, Mr. BARRY as well as Mr. WHICHCORD, and even Mr. W. H. WHITE as their official henchman, appear to have entirely forgotten that they had to deal with a body of men who, by virtue of their everyday business, are *domini* by both law and custom, professional directors, by no means disposed to take things upon trust or to submit to arrogant dictation. At any rate, notwithstanding somewhat unpleasant weather, when Monday evening came there was a large attendance of members, indicating that the expected apathy had been broken in upon.

The business was opened by a somewhat dramatic statement, through the mouth of the amiable Honorary Secretary, of the arrangements made for the periodical Conference of Architects next May, to which everyone must wish all success. Popular applause being thus invoked, Mr. LANGSTON, an Associate, was invited to ask, according to notice given, "Why are not the whole of the proceedings reported?" It appeared, to the surprise of most present, that this scarcely conspicuous query referred to the omission from the fortnightly reports of "Proceedings" of some observations of doubtful utility and prudence; but the persistency with which a discussion was kept up which, in common parlance, was "all about nothing," seemed to indicate a good deal of restless feeling. The Secretaries at length promised attention to the matter, and the subject dropped—in fact, dropped as dead as a brickbat under the shot of a jovial anecdote by Mr. WOODTHORPE, in which he outwoodthorped himself in the direction of sound common sense accentuated by genial humour. One incident of the debate may, however, be mentioned. A casual phrase led to the question being asked whether it was now the rule of the "business" meetings that no matter could be spoken of by a private member unless admitted by the Council into the agenda. The Secretary actually replied in the affirmative, and appealed to the practice of "the House of Commons!" The meeting, however, seemed scarcely to appreciate the connection between No. 9 Conduit Street and the House of Commons, and so another point was accidentally scored against imperialism amidst universal laughter.

A proposal was next brought forward for making the "District-Surveyors-Examination" applicable to all sorts of local surveyors throughout the kingdom; and in spite of explanations from some of the examiners showing the impracticability of this, the President, knowing nothing of the subject, but impressed with the growing importance of making concessions to democracy, judiciously decreed that it should be done somehow.

The motion respecting the constitution of the Council at length came on. Several members spoke well and strongly in favour of the proposed change, but it was amusing to note how gradually it dawned upon them that it was possible for them to gain the day. The studied conciliation and profuse respect for "the Council" in the abstract with which the debate meekly and elegantly began to feel its way, presently, as if by accidental *lapsus lingue*, allowed a strong vernacular word to drop in here and there both expressively and pointedly, the speakers seeming to watch the anxious physiognomy of the President all the while, wondering why he postponed the awful duty of rebuking them. The term "clique" was first tried with fear, then tried with courage, and finally used without restraint. The principle that in order to oppose the house lists of a clique a "conspiracy" became indispensable, at first scouted as matter of decency, was presently recognised and forcibly dwelt upon as matter of fact. Mr. WHICHCORD had sent an excuse for remaining away, and Mr. BARRY, the other "past president," had to take upon himself the whole burden of the defence. Not a soul helped him. He was listened to with impatience. In short, although he carried himself courageously, his cause simply collapsed under the weight of an overwhelming revolt. The Council, as a last demonstration of organised defiance to public opinion, voted "solid," but constituted almost the whole of the minority. The official proposals for the abandonment of the absurd succession to the higher offices were then swallowed by the victorious con-

stituency at a gulp, with a hasty amendment involving the virtual exclusion of Honorary Fellows from the presidency, as if it were thought that even a compliment of mere courtesy to privilege so harmless as this could no longer be conceded.

We cordially congratulate the Institute upon what we regard as the overthrow of a most vicious and anomalous principle, only recently introduced, and calculated expressly, as everybody now clearly sees, to serve a few at the expense of the many. We hope to see as the result before long an entire restoration of that individual freedom which in this country is the only source of strength. One thing that is worthy of notice is the peculiarly businesslike way in which the honour of membership of the Council was weighed. All such honour is well known to carry with it some kind of substantial profit, or people generally would not accept it. This is usually courteously ignored, and thanks are demanded and bestowed for the labour performed. But on Monday night the meeting went directly at the practical root of the matter. "Gentlemen of the Council," the indictment ran, "confess that we others are exactly as good as you, and clearly understand that of the benefits derived from your position we must have our share!" Some fastidious people may perhaps think this was a trifle tradesmanlike; but it was at least honest.

### OLD MASTERS AT THE ROYAL ACADEMY.

THE winter exhibition just opened at the Royal Academy seems to mark distinctly the turn of ebb tide to that stream of "old masters" which has flown into Burlington House uninterruptedly for now fifteen seasons. The wonder of course is that the supply has lasted so long. Neither would it be fair to imply that as regards ancient schools the present show lacks interest; on the contrary, many good examples of Italian and German art are present—intrinsically valuable if not securely accredited—while, as usual, of Dutch and Flemish pictures a large number of indisputable merit have been lent by HER MAJESTY and private owners. Still, it must be granted that no signal work represents either school of the past: there is an end to the masterpieces, unless the Academy can begin over again, which would be very delightful but not wholly practicable, inasmuch as a number of the finest pictures that have appeared in Burlington House are now housed within our National Gallery, or at Berlin, Paris, or elsewhere under State control.

To commence with Italian pictures, which, after usual precedent, are distributed between the fourth room and the long wall of the central gallery. The principal lenders of early masters are Mr. CHARLES BUTLER and Mr. WILLIAM GRAHAM. The former sends several small pictures of early Florentine schools, among them a curious panel of *The Virgin Enthroned*, giving her girdle to St. THOMAS, who appears at one corner in half-figure, with arms extended in a rapturous attitude to receive it. This quaint piece, which has a very Siennese look about it, is attributed to LIPPO DALMASII, a Bolognese painter of the fourteenth century, a pupil of VITALE, and famous like BEATO ANGELICO for his devotion. One of the many copies or *replique* attributed to PIERO DELLA FRANCESCA of the profile head of *Sigismundo Malatesta*, Lord of Rimini, is lent by Mr. DRURY LOWE, and has at any rate more signs of the great Umbrian master than the *Head of Christ* sent by Mr. ROCHE, which distinctly has not the peculiar type invariable to FRANCESCA's heads of the Saviour. Among the most interesting contributions are the four portions of a panel frieze, stated to have been taken from a small room in the Gonzaga Palace of St. Martino, near Mantua, where a thick coat of whitewash has preserved them. The scheme of the frieze consists of a succession of marble niches with short columns, the colours being chiefly grey and reddish, with filling in of a greenish blue. Against the flat are painted in natural relief the heads and shoulders in profile of divers personages, male and female—one to each niche—all wearing some sort of head-dress, and repeating with variations a general colouring of black, pinkish red, and white, with flesh tints, and brown or black hair. The types vary from noble and refined to something almost grotesque in quaint coarseness; but each head is instinct with character and unmistakable portraiture, carried out apparently by a powerful but somewhat untutored hand in a rough, strong way, by some unknown painter of the Mantuan school. The medium was probably tempera,

but the panels have been varnished or treated with a waxy preparation, and appear even to have been patched with oil colour. The touch—especially in the hair—is that of a worker in tempera. These curious panels are lent by Mr. H. WILLETT. An old masters' exhibition without a supposed GIORGIONE is impossible, and Lady ASHBURTON lends her little *Landscape*, with figures of a lady and child and a knight, a much rubbed panel which is accepted as genuine, presumably because examples of early Venetian landscape *genre* of this character are always set down to GIORGIONE. Mr. HESELTINE sends an interesting Venetian *Landscape with Shepherd and Sheep*, a sort of rough pastoral, perhaps a study of background for some Nativity picture. *The Head of St. John on a Charger*, lent by Mr. DRURY LOWE, is probably Milanese in origin, or by a painter who passed under the influence of both Milanese and Bolognese schools; it is a beautiful work, very delicate and close in the modelling of the face, and full of expression.

An important triptych of the *Virgin and Child*, with angels and four saints, set down to RAFAELLINO DEL GARBO, the pupil of FILIPPINO LIPPI, from Mr. W. J. FARRAR'S collection, was, if we mistake not, formerly in the FULLER-MAITLAND. The central compartment, at any rate, might be accepted. The angels especially are of the sweet and intelligent type, with wistful brows, which we find in DEL GARBO'S work; at the same time, the cast of the draperies and set of hands and feet are more in character of a freer and later manner than the graceful affectation of the imputed author. A picture, lent by Mr. BUTLER, of the *Virgin and Child*, blessing with her hand on his head the donor, of whom only the head and shoulders and clasped hands appear, a parti-coloured curtain and landscape seen behind, is a good example of the early Venetian school, attributed to ANDREA PREVITALI, a pupil of GIOVANNI BELLINI. The colour is rich, a little bricky in the reds, and the picture is in good preservation. Within the chief gallery have been hung examples of later Venetian art, none of which are really first-rate. One of the best is lent from the National Gallery of Ireland—a portrait group of *A Gentleman with Two Children*, a grave work in the self-contained manner and chill colouring of GIANBATISTA MORONI of Bergamo. The composition is formal, and the children somewhat like puppets, but the man's head and figure are full of vitality, and his hands, placed on either shoulder of the children, are consummately modelled. The Marquis of LANSDOWNE lends a good portrait by BRONZINO of *Luigi Gonzaga*. It may be remembered that much of this painter's sincere and careful portraiture was executed for members of the GONZAGA family, and the allied house of D'ESTE. A fine specimen of the more showy portraits by TINTORET, in which the dignity of the subject is much due to sumptuous and heavy costume, is *General Duodo*, lent by Lord CLARENCE PAGET. Venetian views, by CANALETTO and GUARDI, of high quality, are lent from the Lansdowne Galleries by Lord EGERTON of Tatton and Lord MOUNT-TEMPLE. These records of Venice, by men whom it is now a fashion, in a certain set, to scorn, become more valuable every day, as old Venice very gradually disappears before modern destruction and modern restoration.

English collections are not strong in the Spanish school, but here and there a good picture comes to light. The MURILLO full-length seated figure of *Don Justino Francesco Neve* is rather black and heavy, but solidly painted, in the Sevillian master's naturalistic phase; a portrait of *Catharine, Duchess of Savoy*, is also admirable in the rigid manner and cold palate of COELLO; and the swarthy and funereal *El Corregidor di Madrid*, lent by Mr. LEYLAND, may be accepted as by VELASQUEZ on faith, as it is absolutely too black to be seen, except under a more searching light than finds its way into the gallery on a London winter's day.

In the fourth room will be found two admirable panels of the early German school, *A Holy Family*, set down to the "Master of Cologne," and *Two Female Saints*, St. BARBARA and another, half-length figures. The rich colour, use of complimentary tints in shading textures, and a certain suavity of type, would incline us to assign both these pictures to a Flemish origin; but the affinity between the Rhine school and that of MEMLING was often very close. Mrs. DAVENPORT lends an excellent example of MEMLING or his school—*A Virgin and Child with Saints*—the central figures in which are identical with those in the great Bruges picture in St. John's Hospital. The German pictures pass chronologically by a leap to the fine HOLBEIN, a half-length figure of *The Banker*, lent by the Marquis of LANSDOWNE, the interval being filled by nothing

important. The Flemish contributions are more numerous, and lead on to a couple of VANDYCK portraits, one of which, a full-length of *Queen Henrietta Maria*, lent by LOUISA, Lady ASHBURTON, is one of the best of the many portraits of CHARLES I.'s wife, painted by VANDYCK with the refinement and distinction that suited so well that high-spirited, high-bred lady. A tremendous canvas, meant for decoration of wall or ceiling, *The Glorification of a Prince of Orange*, in the most redundant style of VANDYCK's master, RUBENS, fills the centre at the head of the long gallery; a few portraits and studies follow, and one interesting landscape, *Farm at Laeken*, painted after the drier manner in which RUBENS sometimes approached PAUL POTTER and the men of the Netherlands, is lent from Buckingham Palace.

Dutch art, as we have said before, comes out well; most of the examples are gathered as usual into the second room, where can be found excellent specimens of TERBURG, STEEN, TENIERS, METSU, an exquisite MIERIS (*Lady and Cavalier*) from the Lansdowne Gallery, at least one good REMBRANDT (the *Portrait of a Lady*, from the same owner), and a couple of studies by FRANZ HALS (*Young Man playing a Guitar* and *A Cavalier*), full of vigorous character and broad, dashing brushwork. The landscapes are not particularly good; the most important RUYSDAEL, *A Storm*, is given honourable place in the chief room. The bird's-eye view of *Amsterdam* (145) is an interesting piece. Mr. LEYLAND's big WYNANTS, a wooded *Landscape*, with a road leading out into the open, shows the occasional closeness of this painter to the greater Haarlem landscape master. One capital little specimen of DE WITTE's cool and precise church interiors is lent by Mr. DE ZAETE. The two specimens of work by the Frenchman, BAPTISTE GREUZE—a portrait of *Gertrude, Baroness Dacre*, and a small study of an old man, *The Miser*—are appropriately hung among Dutch *genre* pictures, where their exquisite finish and purity of execution are not killed by too powerful contrasts of colour or manner.

It will be gathered from this summary of the old masters now in Burlington House that, although the splendid displays of past seasons are no longer to be looked for, yet a large number of pictures of interest and worth have even this year again been collected. It becomes, nevertheless, a question whether another winter should renew an exhibition which may give sanction and an adventitious value to examples of second and third-rate quality and genuineness. The cooking-up of old panels and manufacture of "old masters," the foisting of big names upon indifferent pictures, and the artificial raising of prices, have received under the competition of public bodies and private collectors alarming encouragement. The Academy council disclaims all responsibility as to the pictures which it admits; but the fact of admittance is by the outside buying and collecting public distinctly, and not unjustly, held as a guarantee up to a certain point, and hence the danger we have indicated. On the other hand, the galleries of the Academy do no doubt serve as a test-ground of quality. Amid the assemblage of pictures to a certain degree selected, and the discussion that arises among the knowing, even an "old master" is appraised by a closer and truer standard than the tradition of a family or the arrangements of a dealer.

The decadence of these winter exhibitions has, at all events, been very gently begun. The supply of English pictures of the last century is by no means exhausted, while the roll of "deceased British artists" becomes, alas! with every year a longer and more available source upon which to draw for the filling up of the winter exhibition. The pictures of PAUL FALCONER POOLE, R.A.—the deceased painter illustrated this year—must occupy us next week, together with examples of the English school, from the Anglo-Dutchman, Sir PETER LELY, downwards.

### PARIS NOTES.

THE exhibition of the works of the late M. Edouard Manet, the founder and chief of the "Impressionist" school, has been opened at the Ecole des Beaux-Arts. It comprises upwards of a hundred and fifty paintings, arranged chronologically, and thus affording the public an opportunity of studying the artist in his earliest and in his latest styles. With the exception of a limited circle of enthusiastic admirers of "Impressionist" art, the inspection of these canvases appears generally to have inspired both

critics and amateurs with a feeling of regret that so powerful an artist as M. Manet undoubtedly should have devoted his talents to a crotchet which, although helping him to attract public attention, can never receive the sanction of correct taste. In the works exhibited at the Quai Malaquais the colouring is chiefly remarkable for its crudity and carelessness, though exceptions are not wanting which prove that the artist, had he not been a slave to eccentricity, might have become a great colourist. As a draughtsman, his talent rivets the beholder, and makes evident the master hand beneath all the fantastic trickery of the innovator. Amongst the most noteworthy of the works on show is *Le Bon Bock*, which first compelled the public attention to Manet's claim to notice; but it must be added that the mannerisms of the artist are far less pronounced in this than in most of his paintings. Amongst other principal exhibits may be mentioned *Un Bar aux Folies Bergères*, exhibited in the 1881 Salon; *Le Déjeuner sur l'Herbe*, which figured in the exhibition of works refused admittance to the 1863 Salon; *Les Canotiers*, and portraits of Emile Zola, Rochefort, and Antonin Proust. M. Jules Ferry, President of the Council, accompanied by Madame Ferry, visited the collection on Saturday last, when upwards of 8,000 persons passed through the galleries, while a visit from the President of the Republic was expected on Friday, on which day the entrance was to be 5 frs. The exhibition is open from 9 a.m. until dusk.

An exhibition of M. Meissonier's works is announced to open at the Salle Georges-Petit on April 15. It will comprise about 150 of his pictures, including many lent from foreign countries. Queen Victoria has promised to send *La Rixe*, regarded as one of the master's best works, and belonging to Her Majesty's private collection. With the painting will be seen two wax statuettes, modelled by Meissonier, one representing a *Musketeer*, and the other a *Punch*. The artist, who is said to have already executed upwards of 400 hundred paintings, has lately commenced a large picture of *Bayard Knighting François I.*, amid a brilliant crowd of courtiers and knights.

The picture and sculpture galleries and the state rooms at the Luxembourg Palace, which had been closed during the last session of the Senate, are again open to the public. Several new works have been added, and the places of others changed since the museum was closed. Among the new pictures are Cot's *Mireille*, De Nittis' *Place du Carrousel* and *Place des Pyramides*, Carrier-Belleuse's *Gang of Asphalters*, Roll's *Cow*, and a fine drawing by Lhermitte called the *Old Home*. The added sculptures comprise *Saint-Jean* by Alfred Leloir, a *Venus* by Mercié, *La Fileuse* by Barrias, a *Cupid* by Marqueste, and *Narcisse* by M. Dubois.

The Direction of Fine Arts has decided on the creation of a special department at the Gobelins manufactory for the repair of tapestry belonging to the national collections. Some provision to this end has long been felt to be necessary, for tapestry-work deteriorates rapidly by the fracture of the threads, and the work of joining the parts imperceptibly is a difficult and delicate operation that can only be performed by experienced hands.

Two large bronze decorative vases have just been placed before the principal entrance of the Palais de l'Industrie in the Champs-Élysées. Their subjects represent the *Four Seasons*, and are the work of M. Ledru.

The Minister of Fine Arts has presented to the Chamber of Deputies, in the name of the State, an exact copy of Eugène Delacroix's picture of *La Chasse au Lion*, which was partly destroyed by fire in the Bordeaux Museum. The picture was 13 feet high by 17 feet wide, and was one of the chief works of the master. The copy is by his favourite pupil, M. Andrien, who was able to reconstitute it by the aid of the remains of the original rescued from the flames, and it is this reproduction that has now been placed in the Palais Bourbon.

The committee for the erection of a monument to Gambetta have invited French artists to send in designs. No conditions are imposed with regard to the site or the proportions of the work, the cost of which may amount to 350,000 frs. Models, one-twentieth of the finished size, must be lodged at the Ecole des Beaux-Arts

between May 25 and June 1, after which a selection of three of the works will be made, and, if neither of them is definitely selected, they will receive premiums of 10,000, 6,000, and 4,000 frs. respectively, according to their order of merit.

The monument to the great masters of landscape, Millet and Rousseau, for which a subscription was some time back opened by the artists who frequent, for purposes of study, the little village of Barbizon, on the edge of the Forest of Fontainebleau, has just been erected near that place, and will be officially inaugurated on Easter Monday. The work is by M. Chapu, and consists of a bronze tablet, on which the busts of the artists form medallions in high relief.

A special gallery devoted to exhibits illustrative and explanatory of the art of building in all its branches has lately been opened at the Conservatoire des Arts et Métiers.

The alterations lately made on the Place Denfert-Rochereau have necessitated the removal of the two last remaining rotundas of the old city boundary, sixty of which were erected in the year 1786 by the architect Ledoux. The Convention, on July 1, 1794, passed a decree by which they were to be put to a curious and characteristic use. Under this law they were classed as public monuments, and it was directed that the great events of the Revolution, and the victories gained by the armies of the Republic, should be inscribed thereon from time to time in characters of bronze, artists and men of letters being invited to contribute to the work of execution.

It seems scarcely credible that lighting by oil-lamps should still prevail to a considerable extent in the older quarters of the French capital. Yet that such is the case is abundantly proved by the notice just issued from the Prefecture of the Seine, inviting tenders for trimming and keeping in repair oil reflector-lamps to the number of 1,539. These old-world contrivances are principally to be found in the annexed communes, in the Faubourgs Saint-Jacques, Saint-Marcel, Saint-Antoine, and in the narrow lanes of the Saint-Martin quarter.

At its last sitting the Académie des Beaux-Arts had to appoint its officers for the present year. M. Guillaume was elected president; M. Bouguereau vice-president; while MM. Questel and Bailly, the outgoing members of the central administrative committee, were reappointed. The Academy has decided to petition the Minister of Fine Arts to increase the yearly scholarship payable to pupils at the Villa Medici in Rome, to the same amount as that received by those of the French school in the same city.

#### PROFESSOR DAWKINS ON ART STUDY.

AN address was delivered by Professor W. Boyd Dawkins, F.R.S., at the distribution of prizes to the students of the Brighton School of Science and Art. In the course of it he said there were two important requisites or corner-stones to the proper study of art. The first was that by which a student was enabled to see things. It was absolutely necessary, before anything could be represented properly, that it should be seen properly. He knew from his own experience that it was one of the rarest things in the world for a man really to be able to see a thing properly. But he did not know that a man could learn to see things outside himself properly better than by trying to represent them. A man could not realise the beauty of a figure or a landscape, unless he had attempted to draw them. Until he had a knowledge of the essentials to the production, until he could pick out the salient points in the landscape or figure, he doubted much whether any man could be said to have seen the one or the other. With regard to the second corner-stone, the power of representation, he thought there was as great a dearth in that direction as there was in the power of seeing. He believed that many artists who had reached the highest rank in their profession were deficient in the capacity of adequately representing what they saw. He therefore desired to impress upon the minds of the young art students that their first duty was to represent in their art what they actually saw, and what was true. They must study the conditions and master the surroundings of the picture which they had to represent, and, above all things, try to be true to nature. The Professor then called attention to a number of rough sketches of animals, fishes, &c., arranged at the back of the platform, which, he said, represented the earliest traces of art known in Europe. Pointing to

one sketch, that of a reindeer feeding, he said his audience would notice that the outline was wonderfully well done. Its unmistakable contour was clearly defined, and was altogether a piece of true art. When they saw such a figure they were perfectly certain that the individual who drew it represented exactly what he saw. Yet those drawings were originally produced upon fragments of antlers and of bone, and little pieces of stone, while the drawing implements those early artists had at their command consisted only of rude splinters of flint. Those drawings also indicated that the young artist should not begin with the brush, painting away with indistinct outlines, but first try to represent objects by bold outlines, which, he believed, was the best way of arriving at a thorough mastery of art. In conclusion, the Professor stated he would say a few words regarding some other things. He thought there was in this country most unfortunately an antagonism existing between hand-work and head-work. In this country there were two distinct lines, if he might so put it. There was one which he might call the professional line, where it was considered a very fine and estimable thing for a man not to work with his hand, but with his head or pen. That antagonism seemed to him most unfortunate, and he thought all students should bear in mind that it was a thing which really ought not to exist. It would not exist if it were not for an intensity of vulgar prejudice. He would say that the old craftsmen of Italy, those men who were the builders of Florence and other great cities, were men who had no prejudice of that kind, and he thought that, if they really wished to do their work in the world, they must get rid of that absurd and ridiculous prejudice as quickly as possible. The work truly done was equally noble, and the man who made a table to the best of his ability was equally great, as far as his work went, with the man who painted a beautiful picture or composed a beautiful piece of music. That consideration led him to another point, and that was—What was to be the end of all this higher education? It seemed to him that if the end of it all was the production of more professional men—more doctors, more lawyers, more clergymen, more professors, and more clerks—the less they had to do with it the better. The professional classes were being overstocked, owing to that vulgar prejudice, and if education was to be of any good it should aim at making a man better fitted to carry on his work in the world than he was before. His opinion was that the best education was that which would make a man better at his handicraft. If a man had the chance of pushing forward in the world let him do so, but if he tried to get out of his own line of life let him do it at his peril. It appeared to him a most ridiculous thing that a man who knew a great deal of Latin, or geology, or chemistry, should on that account think himself entitled to be supported by the State. The education he had in his mind, and which seemed to him to be the highest form of education, was that which was not confined to the rich, which belonged not to one class any more than the other, but to all, and which would enable all classes equally to do their work better in the position in which they found themselves.

#### LYCIAN ART.

THE first of a course of lectures on "Monuments of Lycian Art" has been delivered by Professor Newton, C.B., at University College, London. At the outset of the lecture he stated that the question we have to study in the case of Lycian monuments is how far they can be considered Greek, as Lycia was originally inhabited by at least two races who were certainly not Greek—the Solymi, who were a Semitic race speaking Phœnician in the time of Xerxes, and who at a later period were called Milyæ, and the people whose original name was Tremilæ, and who were afterwards called Lycians. This latter was a race belonging to the Aryan family, whose language is preserved to us in the inscriptions on many Lycian monuments, and is thought to be allied to the old Persian and old Armenian. At a very early period settlements from Greece and from Crete were established on the coast of Lycia. The myth of Bellerophon, as told in the "Iliad" by the Lycian hero Glaucos, must be accepted as legendary evidence of these early settlements. But the Greeks who got a footing in Lycia did not succeed in driving out or subjugating the races they found there as completely as they had done in the case of the Carians and Leleges, who in prehistoric times dwelt along the coasts of Caria and Ionia. It would seem from Homer and other ancient writers that the Semitic race called Solymi were driven back into the mountains on the east and north frontiers of Lycia, and that the people originally called Tremilæ became mixed with Greek settlers along the coast; but the Hellenic element thus gradually introduced was not strong enough to make the Greek language prevail over the native language till after the conquest of Asia Minor by Alexander the Great, when Lycia and many other provinces were more completely Hellenised. It is to the period between the conquest of Lycia under Cyrus and the overthrow of the Persian dynasty by Alexander that the most interesting monuments of Lycia belong, and to the same period we may assign the inscriptions in the Lycian language, and the interesting series of silver coins, struck by a number of autonomous cities and inscribed with their names in Lycian characters, but having on one side the

curious symbol called the Triquetra, resembling the Manx three legs. On turning to the scanty evidence to be found in ancient authors as to the history of Lycia, we find that there was one remarkable feature in their institutions—the confederacy of free cities, called by ancient writers the Lycian League. This league was probably in existence before the Persian war, and lasted through many vicissitudes and perils down to the time of Augustus, and probably later till the time of the Emperor Titus, who finally suppressed the autonomy of Lycia, uniting it with Pamphylia as a Roman province. Its organisation was so well contrived that the federation of so many independent states did not add to jealousies such as arose in Bœotia and other Greek leagues from the attempts of one member of the confederacy to domineer over the rest. It was the successful maintenance of the Lycian League through so many centuries which induced Aristotle to write a treatise on it, now unhappily lost; which induced Montesquieu to declare it the most perfect example of a league in history, and which has led Mr. Freeman to give so favourable and prominent a notice of it in his work on Federal Governments. The physical features of Lycia—a country broken up and intersected by high mountains, with fertile valleys and plateaux at rare intervals—favoured the division of the country into districts, something like the cantons of Switzerland, which were easily fortified and difficult of access. The lecturer here showed on a map the outlines of the geography of Lycia—its mountain ranges, of which the highest, Massikyts, on the western side, towers to the height of 10,000 feet; its rivers and their valleys, and its seaports, which in antiquity afforded excellent shelter for shipping, but of which several are now silted up with sand. Two of these harbours, Myra and Patara, are mentioned in the narrative of the voyage of St. Paul in the Acts of the Apostles.

#### GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held on the 8th inst. in the Philosophical Society's rooms, the President in the chair. In view of the recent calamity which had befallen the Association in the destruction by fire of all its belongings—furniture, casts, library, and drawings—it was resolved to at once re-engage suitable premises and occupy as before.

Mr. William McNab read a paper on "Half-Timber Work," in which he gave a minute historical account of the different phases of English work, exhibiting prints illustrative of each. Continental timber construction was also noticed shortly. While fully appreciating the distinctive characteristics of Scotch architecture, Mr. McNab thought many of the features found in English domestic work quite suitable for a more northern climate, and their adoption would be a decided advantage.

The critic of the paper, Mr. John C. T. Murray, also approved of the reintroduction of half-timber work in Scotland, as, though there are but few examples existing, at one time it was undoubtedly pretty extensively employed in and about feudal castles.

#### THE GROWTH OF LONDON.

ON Tuesday last Sir J. W. Bazalgette, C.B., delivered his inaugural address as President of the Institution of Civil Engineers. The subject selected was the growth of London, than which nothing could be more appropriate, considering the position of the author as the engineer to the Metropolitan Board of Works. After a reference to the increase in the number of members of the Institution, Sir J. W. Bazalgette said:—

##### *Population and Traffic.*

London, or the metropolis as defined by the Metropolis Management Act of 1855, contains at the present time nearly 4,000,000 of people, covering an area of 117 miles, upon which are built 500,000 houses, giving an average of eight persons to each house, and nearly seven houses and fifty-three persons to each acre. Its population is equal to that of the whole state of Holland, is greater than that of Scotland, and double that of Denmark, and if it continues to increase at the present rate until the end of the century, it will then equal that of Ireland, as, indeed, Outer London now does. The value of property in London has increased even more rapidly than its population. In 1841 its rateable value was 6,000,000*l.* sterling, in 1855 it was 10,500,000*l.*, and at the present time it is 28,000,000*l.*, having increased nearly five-fold in the last forty-three years. But the traffic through London has increased even more rapidly than either its population or rateable value. The arterial lines of thoroughfare, which were wide enough half a century ago, are now altogether insufficient. Thus, for instance, although the Strand and Cheapside have been relieved by the formation of a new route between Charing Cross and the Bank, along the Victoria Embankment and Queen Victoria Street; and Holborn has been relieved by a new route from Oxford Street to Shoreditch; and new and widened streets continue to be made through the City and other crowded localities, the old lines of thoroughfare still remain congested by the traffic; 384,000 pedestrians and 75,000 vehicles now pass

over the metropolitan bridges daily; and the number of pedestrians increases at the rate of 4½ per cent. per annum, while the vehicles have increased at the rate of 13 per cent. The traffic on three metropolitan railways—viz., the Metropolitan, the Metropolitan District, and the North London, together increased between 1871 and 1881 from 79,000,000 to 136,000,000 per annum, or to 373,000 passengers per diem.

##### *Government.*

The government of the ancient City of London, by its Lord Mayor and Corporation, has up to the present time remained intact, with all its privileges and wealth; excepting that as part of the general municipality it sends three members to the Metropolitan Board of Works. But the metropolis has from time to time been placed under the management of various local authorities. Prior to 1848 there were seven independent commissions of sewers. These were then consolidated into one commission. In 1855 the principle of local self-government was adopted, and thirty-eight vestries or district boards, under the control of the Metropolitan Board of Works, were substituted, being representative bodies. The Metropolitan Board was also clothed with additional powers and duties; and these have almost every subsequent year been enlarged, until it has now become the administrative authority for over 100 Acts of Parliament, affecting the metropolis. The present Government, however, have contemplated the creation of a new municipality, which shall include the City and govern all the interests of the metropolis as a whole.

##### *Streets.*

In 1878 there were 1,710 miles of streets, roads, and courts, 1,338 miles of which were macadamised or flint roads of an average width of 30 feet between the channeling, and upon which was laid in the course of the year 307,700 tons of macadam, flint, or hoggins; 274 miles were granite paved roads, 61 miles were paved courts, 15 miles wood-paving, and 22 miles asphalt; but since that period wood-paving has been extensively substituted for some of the other kinds.

##### *Drainage.*

There are now about 2,300 miles of underground covered sewers, more than half of which have been constructed during the last twenty-seven years. They vary in size from 9 inches to 12 feet 6 inches in diameter. All the houses are connected with them, and the house refuse and the most offensive decomposing matter is removed through them by the water supplied to the houses flowing through the sewers after use, in an unobtrusive, inoffensive, and economical manner, and without manipulation of any kind. The waste water thus becomes the motive power or carrier for conveying the refuse to covered reservoirs on the banks of the Thames twelve miles below London Bridge. These reservoirs are 16 acres in extent, and capable of containing 60,000,000 gallons; and an average of about 150,000,000 gallons of sewage and rainfall are discharged at the outfalls into the river daily on the ebb tides. The main intercepting scheme was practically completed and came into operation in 1870-71; and, considering that the mean annual death-rate in London was in the decade ending 1850 24·8 per 1,000, in that ending 1860 23·7, in that ending 1870 24·4, and in that ending 1880 it had been reduced to 22·5, and for the year ending 1882 was only 21·4, it may not be unfair to claim for those works a considerable share in this decrease of the deaths. But a decrease from 24·4 to 21·4, or three persons per thousand, represents about 12,000 lives saved every year in London, and a proportionate increased length of life to the living. The death-rate for the past year has not yet been published, but it will probably be found to be about 1 per 1,000 lower than in 1882, so that the improvement since 1870 has been continuous, and the annual saving of life now as compared with 1870 is about 16,000.

##### *Water Supply.*

London is at present supplied with water by eight independent water companies. They supply in the aggregate 140,000,000 gallons daily, of which from 15,000,000 to 18,000,000 are consumed outside the metropolitan boundaries. The consumption within the metropolis is at the rate of about 31 gallons per head per diem. Of the total quantity, 69,000,000 gallons are obtained from the Thames, and 71,000,000 from the River Lee, the New River, and other sources. The charges of the water companies for the water are, with minor exceptions, based upon the rateable value of the houses supplied, and not according to the quantity of water consumed; that is to say, by their Acts of 1852, the Chelsea, the Grand Junction, the New River, and the West Middlesex Water Companies are authorised to charge 4 per cent. on houses rated under 200*l.* and 3 per cent. on houses rated over 200*l.*; and the East London and the Southwark and Vauxhall to charge 5 per cent. on the rateable value of all houses; while the Lambeth, by their Act of 1848, may charge water rates varying from 7½ per cent. on small houses to 5½ per cent. on houses rated over 100*l.*; and the Kent Company, by their Act of 1864, may charge from 6 per cent. on small houses to 4 per cent. on houses rated at 90*l.* and upwards; and all the companies are authorised to make additional charges, fixed according to rateable value, for baths and waterclosets, and in some cases for high service. But inasmuch

as the rateable value of the houses in London has risen since 1855 from 4*l.* per head to 7*l.* per head of the population, and the consumption of water per head has remained the same, the price of water, as based upon the rateable value, is now 75 per cent. dearer than it was in 1855; and there is no reason to doubt that so long as the price remains a fixed charge upon the rateable value of the houses, the cost of each gallon of water consumed and the value of the property of the water companies will continue to increase in every future year in the like ratio. The total capital employed by the water companies is about 13,200,000*l.*, or at the rate of 61*7d.* per 1,000 gallons of water supplied, and the net charge for water amounts to 7*3d.* per 1,000 gallons; while the annual cost of pumping and maintenance of works is 1*1d.*, and the cost of engineering and management is 2*1d.* per 1,000 gallons, showing a net profit of 4*1d.* per 1,000 gallons. In 1880 it was proposed to purchase the interests and property of the water companies, and place the water supply under the municipal authority, as it is in Glasgow, Manchester, Liverpool, and in most foreign cities; and an arbitrator between the Government and the water companies valued their interest at that time at 33,000,000*l.* The mode of charging upon the rateable value of the houses, instead of by meter, moreover, makes the payment for the quantity consumed fall very unequally upon the consumers. If charged by meter, a very effective check would be put upon the serious waste which now takes place. A purer and more copious supply of water on constant supply and at high pressure is demanded, and whether this is to be attained by purchase or by some regulation of the present water companies' powers, it is obvious that each year's delay will only increase the cost and the difficulties involved.

#### *Gas and Electric Lighting.*

The lighting of the metropolis is effected mainly by three gas companies, at a cost varying from 2*s.* 10*d.* to 3*s.* 2*d.* per 1,000 cubic feet. Over 20,000 millions of cubic feet of gas per annum are manufactured out of two millions of tons of coal, and it is distributed through pipes, the total length of which is about 2,500 miles, and they vary from 3 inches to 4 feet in diameter. The cost of lighting London by gas is therefore about 3,000,000*l.* per annum, or more than double the cost of its water supply. But electric lighting is rapidly advancing; and, in confirmation of Dr. Hopkinson's opinion that it may be looked upon as the lighting of the future, it may be mentioned that when, in 1878, the Jablochhoff Company commenced lighting a portion of the Victoria Embankment, the charge for each lamp was 5*d.* per hour. At the end of three months the price was reduced to 3*d.* Six months later it was reduced to 2½*d.*, and since June 1881, forty lights on the Embankment and ten on Waterloo Bridge have continued to be lighted at the rate of 1½*d.* per light per hour. Each of the electric lamps on the Embankment gives an illuminating power of 265 candles, so that, at the charge of 1½*d.* per hour per lamp, the cost per 1,000-candle power is 5*66d.* per hour; while gas, at 3*s.* per 1,000 cubic feet, and consuming five cubic feet per hour for every sixteen candles, costs per 1,000-candle power 11*25d.* per hour. In other words, twice the illuminating power is at present obtained on the Embankment by electric lighting for the same money if expended on gas. But it has been stated that the Jablochhoff Company are losing money on this contract. Incandescent lighting, though much more costly in production, is more economical in the regulation and distribution of the light.

#### *Bridges, &c.*

Eleven of the bridges over the Thames, on which tolls were levied, have been purchased, and made free of toll within the last five years. At Hammersmith, Putney, and Deptford Creek new bridges are in process of construction. A new bridge at Battersea will shortly be built, and others have been strengthened with new chains or deeper foundations. But, considering that over 1,500,000 people live east of London Bridge, that is to say, a greater population than exists in any city in the world, except London and Paris, it cannot be doubted that there is still a great need of improved communication across the river below London Bridge. The Victoria, the Albert, and the Chelsea Embankments of the Thames are a total length of about 3 miles, and by them 52½ acres of mud foreshore have been reclaimed from the river and converted into thoroughfares and ornamental gardens.

#### *Protection against Fire.*

Since 1865 the extinction of fires and the saving of life and property from fire has been a duty cast upon the municipality, and a brigade is maintained, under the direction of Captain Shaw, containing 54 land-engine stations, 4 floating engines, 124 fire-escape stations, 576 firemen, 41 steam and 115 manual fire-engines, besides tugs and other appliances. There were, in 1882, 1,926 fires, of which only 164 resulted in serious damage, and only 36 persons lost their lives, owing to the able management and gallant conduct of that small staff. The consumption of water in extinguishing fires is about 17,000,000 gallons, and the cost of the brigade is rather over 100,000*l.* a year.

#### *Police, &c.*

The metropolitan police outside the City are under the supervision of Commissioners appointed by the Government; but the

Corporation of the City appoints its own police. They number in all 13,000; the area protected by them extends over Outer London, and covers 700 square miles, and the proportion of police to the population is rather less than in Paris, which is one in 373. But the area over which the metropolitan police are scattered is twenty-three times larger than Paris, and it is satisfactory to know that, in spite of the amount of crime which escapes detection and punishment, London is the safest capital for life and property in the world. There are in London about 10,000 cabs and 2,000 omnibuses or stage-coaches, under the management of the metropolitan police.

#### *Parks.*

The parks, commons, and open spaces which are available for public recreation within the metropolis, and which form the lungs of London, are 42 in number, and contain about 4,490 acres, exclusive of the squares, or about 6 per cent. of the whole area of London; while just outside the boundary are Epping Forest, Richmond Park, and Wimbledon Common, together containing over 9,000 acres more.

#### *Markets.*

There are 14 markets of various kinds. The most important of these are:—Farringdon dead meat and poultry market, and Deptford foreign cattle market; Islington cattle markets, 15 acres in extent; Billingsgate fish market and Covent Garden vegetable market; and into these markets are imported annually, for consumption in London, about 800,000 head of cattle, 4,000,000 of sheep, calves, and pigs, also 9,000,000 of fowls, game, and rabbits, and over 100,000,000 of eggs, and a like number of oranges and lemons. About 320,000,000 of quarter loaves are consumed in London annually. Billingsgate fish market covers only half an acre, and, being insufficient for the supply of fish to the whole of London, a new market is contemplated. Thirty-five thousand vessels and 100,000 fishermen are employed in catching fish upon the coasts of the United Kingdom, and, besides the fish exported, 400,000 tons of fish are consumed in this country, of which 130,000 tons are sent to London, two-thirds by rail and one-third by water. The average wholesale price of fish sold in Billingsgate is 1½*d.* per lb., but the consumer does not get the benefit of this low rate; and to enable the poorer classes to enjoy the food which so abundantly surrounds our shores, a market is needed which shall be accessible to all railways, having the means of storing fish in dry air at a temperature of 34 degrees, and accompanied by the means of rapid distribution to all parts of the metropolis.

#### *Comparison with Paris.*

Paris contains a population of 2,240,000, occupying 77,000 houses, and covering an area of 30 square miles. This gives an average of 29 persons per house, and 4 houses and 116 persons per acre. Paris, therefore, is more than twice as densely peopled as London, and each house in Paris contains nearly four times as many inmates as the London houses. Its rateable value is 24,000,000*l.* sterling, being not quite one-third less than that of London. It has 582 miles of streets, upon which are laid 73½ miles of tramways, and the total length of its sewers is 440 miles. Great care and labour are expended in cleansing and watering the streets and ornamental spaces in Paris. From a surface of over 13,000,000 square yards of street are removed annually 100,000 cubic yards of deposit, equal to a depth of ¼ inch of mud, dust, and garbage spread over the whole surface. The cost of street-cleansing in 1881 was 245,000*l.*, with a further expenditure of 82,000*l.* for removing snow. The annual rainfall is 22 inches. The water supply amounts to 82,000,000 gallons per diem, being at the rate of 36 gallons per head of the population. Two-thirds of this are obtained from the rivers Seine, Marne, and Ourcq, and one-third from distant springs and artesian wells in Paris. Its sewers vary in size from 6 feet 6 inches by 3 feet to 18 feet 5 inches by 14 feet 5 inches; but the larger ones are, in fact, subways, containing galleries with a channel in the centre, and water-pipes overhead. The construction of these has cost over 4,000,000*l.*, and their cleansing and maintenance about 50,000*l.* a year. A small portion of the sewage is disposed of by the irrigation of garden ground in the neighbourhood of Paris, but by far the greater portion is still removed out of the city in cans by carts. In 1869 600,000 cubic yards were thus removed, at an annual cost of about 2*s.* 3½*d.* per head of the population. There are four abattoirs under the administration of the municipality. Paris is lighted by gas lamps equivalent to 44,000 lamps of one burner each, which consume 770,000,000 cubic feet of gas, at a cost for gas of 130,000*l.*, or about 3*s.* 4*d.* per 1,000 cubic feet, and a total cost of 190,000*l.* per annum, including lighting and maintenance. This latter sum includes also the electric lighting of the Avenue de l'Opéra, the Cours de Louvre, and the Carousel; but this does not include the cost of lighting the private houses. There are in Paris 600 omnibuses, 520 tramcars, 500 steamboats on the Seine, over 8,000 cabs, and the city is protected by a force of 6,000 men acting as police.

#### *The Artisans' Dwellings Question.*

Prior to the introduction of the Artisans' and Labourers' Dwellings Act of 1875 much had been done by private efforts to improve the dwellings of the poorer classes. No fewer than 28 associations

had been formed with this object, and had provided improved homes for 32,435 persons, at a cost of about 1,200,000*l.*, and at an average rental per week of from 2*s.* to 2*s.* 9*d.* for one room, 3*s.* to 3*s.* 6*d.* for two rooms, and 4*s.* 6*d.* to 6*s.* 6*d.* for three rooms. The return realised upon the outlay varied from  $2\frac{3}{8}$  to  $6\frac{1}{4}$  per cent. The average cost of eight blocks of buildings erected by the Metropolitan Association, including the purchase of land, or, where leased, the ground-rents capitalised, was at the average rate of 41*l.* per inhabitant, varying from 29*l.* to 81*l.* But these associations had the advantage of selecting such vacant sites as they could obtain on the most favourable terms; while under the operation of the Artisans' Dwellings Act, the houses on any unhealthy district for which the new buildings are substituted must first be purchased compulsorily, as well as the public-houses and shops which are frequently mixed up with them, with all their trade interests, at a very heavy cost, and then cleared, and new thoroughfares and sewers constructed. Twelve areas, situate in different parts of London, embracing an aggregate area of 40 acres, in which the houses were overcrowded and declared to be unfit for human habitation, have been already dealt with by the Metropolitan Board of Works, at a cost of 1,500,000*l.*, and some further areas by the Corporation. In several areas the houses have been pulled down, new streets formed, and new buildings for the working-classes erected on the sites, and in others the works are in various stages of progress. The cost of the new buildings has varied from 6*d.* to 8*d.* per cubic foot of the building, and the sites which have been cleared for their erection have been sold at prices ranging from 2*s.* to 5*s.* per foot super.

Inasmuch as the cost of a building depends mainly upon its size, it becomes necessary to consider what is the minimum air space which can, with due regard to health, be allotted to each inmate. In the dormitories of poorhouses and prisons a breathing space of from 450 to 500 cubic feet, with proper ventilation, has been deemed requisite for a healthy man; and two children have been estimated as equal to one adult. The police requirements for the common lodging-houses are 240 cubic feet per head, and 450 cubic feet are allowed to each policeman lodged at a station. The Poor Law Board allowed 500 cubic feet per head in sick wards, and 300 feet for every healthy person in dormitories. Now, 300 cubic feet per head means a room for two people, 8 feet high and  $8\frac{3}{4}$  feet square, or four people a room 8 feet high and  $12\frac{1}{4}$  feet square; while 500 cubic feet per head means a room 8 feet high and  $11\frac{1}{4}$  feet square for two people, and a room 8 feet high and  $15\frac{3}{4}$  feet square for four adults; 500 cubic feet per inhabitant have been generally allowed in carrying out the provisions of the Artisans' Dwellings Act; and as the doors and windows of the new buildings are larger, and the surrounding streets and open spaces much wider than previously, the ventilation of the new buildings is superior to that of the old ones and the condition of the atmosphere is thus rendered purer, although this air space is less than could be desired.

Nevertheless in comparing the death-rate which has been below the average of that of the metropolis in the new buildings, and the death-rate of the unhealthy localities for which they were substituted, it must not be forgotten that the comparisons refer to a totally different class of persons; all the habits of the persons displaced being eminently conducive to the shortening of life. A practical difficulty is, moreover, involved in every attempt to provide suitable houses compulsorily for the poorer classes—namely, that they object to be placed under any supervision or restraint, and cannot afford to pay the rents necessary to defray the cost at which the improved accommodation can be so provided, and even where low rents have been offered it has been found that the new dwellings became inhabited by a better class than those who have been displaced from the unhealthy localities, and the occupants of these are driven into other poor neighbourhoods, which are thus again rendered overcrowded and unhealthy. This, in fact, constitutes a great social dilemma, for while on the one hand the importance of suitable and healthy dwellings for the poor will be readily admitted, it may fairly be questioned whether it is just to throw the increased charge upon the rates, so that the man who is able only by industry and self-denial to pay his own rent, should be taxed for the rent of his less industrious and more self-indulgent neighbour; and why, he may fairly ask, if he is to pay a portion of his neighbour's house rent, should not the cost of his neighbour's food and clothing also be defrayed out of the public funds? In order to be brought under the operation of the Artisans' Dwellings Act it becomes the interest of the landlord of the dwellings of the poor to allow them to fall into a condition which renders them unfit for human habitation, so that they may be purchased compulsorily, and the higher the rents the larger will be the amount of compensation he will obtain. It ought, on the contrary, to be made a disadvantage and loss to him to have his property declared unhealthy. This property is frequently sublet to middle-men who collect such rents as produce a very high rate of interest on its value. What is needed is a more strict supervision by one competent authority, having no local interest, so that all places may be judged by a uniform standard. The provisions of the Common Lodging Houses Act, 1851, or of the Public Health Act of 1866, and the Artisans' Dwellings Act of 1868, 1879, and 1882, might be

modified, and the authority armed with more summary powers to oblige the landlords to repair and maintain their houses in a habitable and cleanly condition, and to prevent the demoralising influence of overcrowding; and in case of default, after due notice, such houses should be pulled down in the same manner in which "dangerous structures" are now dealt with under the Building Act of 1855. If the sites so cleared were sold for the erection of new dwellings for the poor, and money advanced for their erection at a low rate of interest, coupled with restrictions as to the class of building, and limiting the number of occupants, and the rents to be charged, the existing dwellings of the poor would be maintained in a proper manner, or new ones would be substituted at low rents. The new dwellings would, nevertheless, become occupied by the labouring classes in receipt of regular wages, to whom undoubtedly a preference would be given; and the helpless and the depraved, who now seek shelter in overcrowded slums, would eventually be driven into the workhouses or common lodging-houses.

Longevity and premature decay are doubtless influenced by the food and general habits of the people, and by temperature and other local atmospheric conditions, although all these may be largely modified and brought under control by attention to sanitary laws and appliances. Artificial atmospheres are in fact created in large cities according to the character of the buildings, the air-space allotted in them to each inmate, and the mode of ventilation and warming, as well as by the width of the streets, the sewerage, and other sanitary arrangements. Moreover, the hereditary constitutions of the citizens become in after generations affected by the condition of the cities in which they and their forefathers have lived. The facts and figures before us point to many of the causes for so great a variation in the death-rate as has been shown to exist in different cities. A high death-rate will in most cases be found to be the companion of defective house accommodation, ventilation, water supply, sewerage, or scavenging. Thus, for instance, St. Petersburg, with a population of nearly a million, and the high death-rate of 35·2 per 1,000, is without sewerage, and its water-supply is taken from the River Neva, more or less contaminated by percolation from the subsoil. Cairo, with a death-rate of 37 per 1,000, is supplied with water from the Nile, having no sewers, and the sewerage filtering through the subsoil into the Nile above the water intake. Vienna, with a death-rate of 29·2 per 1,000, has an average of 60 people in each house, or twice as many as in Paris, while the rateable value of the houses in Vienna is only one-sixth more than those in Paris. Peking, with a death-rate of 50 per 1,000, is without proper sewerage, water-supply, street-cleansing, or other proper sanitary arrangements. The subject thus briefly touched upon largely affects the life and well-being of mankind, and is sufficiently interesting to invite closer and more exhaustive investigation under every variety of circumstances.

## THE SIZE OF BRICKS.

THE best method of developing the art of building in brick has occupied the attention of architects and engineers in Switzerland for some years, and with this view it has been determined to attempt to fix a certain standard size of brick, and a report was presented to the Swiss Society of Architects and Engineers, in which the dimensions recommended were 9·84 inches by 4·72 inches by 2·36 inches. As, however, these dimensions were not agreed to by all sections of the society, a special federal commission was appointed in December 1882, to inquire into the subject.

A report was presented to the General Assembly of Cantonal Delegates at Berne, by M. Favod. The author first of all gives a brief account of the bricks that were used by the Assyrians, Egyptians, and other ancient peoples. He then gives tables of the dimensions of the bricks that were used from remote periods up to the seventeenth century, and of those in use at the present day in Italy, France, England, Belgium, Austria, Germany, and Switzerland. From these tables he shows that the standard size should be between the limits of 4·45 inches long, 4·33 inches broad, and 1·97 or 2·56 or 2·76 inches thick; and 11·63 inches long, 5·12 inches wide, and 1·97 or 2·56 or 2·76 inches thick; or, taking a mean, the size should be 9·84 inches by 4·72 inches by 2·36 inches. This size is made at the present time, as is also that of 9·84 inches by 4·72 inches by 2·76 inches. The author is greatly in favour of the thicker brick, and a great deal of the paper is taken up with a discussion of the possibility of properly burning it, many of the Swiss brick-burners having stated that they cannot burn bricks having a greater thickness than 2·36 inches. In reference to the thicker bricks he remarks:—1st. That the other dimensions remaining the same, the resistance increases with the thickness. 2nd. There is, perhaps, rather more difficulty in drying a thick brick, but care in mixing the beds of clay, the addition of sand, gradual drying, &c., will readily get over it. 3rd. In burning, the bricks must be carefully placed in the kilns, as the gas will follow the shortest route to the outlet; the bricks must be arranged so as to oppose obstacles to its escape in this direction, while facilitating its passage by the longer route.

The bricks after being dried in the sheds, should be further dried by hot air from the kilns before being burnt. All apertures by which the air could pass into the kilns must be carefully closed, and the cooling of the bricks must be gradual. 4th. When colour is of importance, attention must be paid to the fuel. Coals of inferior quality frequently contain extraneous matter which is deleterious to good colour, and also to the weathering qualities of the bricks, and is sometimes the cause of efflorescence. 5th. With the same materials there will be a better output of first-class bricks with a 2.76 inch than a 2.36 inch thickness, because vitrification does not begin so soon. Of course, the best quality cannot be obtained from clays which are very chalky, earthy, or sandy, but with careful manipulation very fair bricks may be made from very moderately good earth.

The author conducted some experiments at the Horn brick-fields of M. Bourry, where the bricks are made by machinery and burnt in Hoffman kilns. These experiments were performed with eight varieties of earth, three blue, three yellow, one sandy, and one earthy. Bricks were made from each variety separately, and also from mixtures of different kinds; their dimensions were 9.45 inches by 4.53 inches by 2.76 inches. They were dried under different conditions, according to their kind, and burnt carefully in kilns with other bricks. The result was that each different clay and each mixture produced bricks of different colours, but all well-burnt and sound.

With regard to the question of price, of course if the manufacturer sells his bricks by the thousand, without reference to size, the smaller they are the better for him. The contractor, too, is apt to prefer small bricks, because with them he uses more mortar, which costs him less; but, on the other hand, he requires more bricks per cubic yard (the number of bricks of different sizes in a cube metre of work are given), and there is more labour in setting them, so that what he gains in one way he loses in another.

In regard to the quantity of mortar Dr. Boehme's experiments at Berlin in 1875 proved that no more mortar than was actually necessary to keep the course horizontal and effect the cohesion of the bricks (for which purpose joints of 0.4 inch [thick] are ample) should be used, as, whether the mortar becomes more or less hard than the bricks, the result is in either case to reduce the strength of the work. Experiments made with blocks of twenty sound bricks, one set of blocks cemented with various kinds of mortar and cement (the joints 0.4 inch thick), another set consisting of bricks laid dry, and surrounded with cement simply to keep them together, gave as mean resistances to compression:—For the first set, 1,618 lbs. per square inch to cause splitting, 1,934 lbs. for the destruction of the bricks; and for the second set 2,202 lbs. per square inch to cause splitting, and 2,291 lbs. per square inch for destruction, showing that the dry bricks gave a mean resistance of one-third more than those set with mortar before splitting, and one-fifth more before destruction. The author, therefore, concludes that to secure the greatest strength thick bricks with a minimum of mortar should be used.

The author suggests that the price of bricks per thousand should vary according to the number required per cubic metre of work, so that the manufacturer may be paid according to the size of the bricks. Finally, he recommends that the standard brick should have the dimensions 9.84 inches by 4.72 inches by 2.56 inches.

## CHURCH BUILDING IN DURHAM.

A MEETING has been held in Durham to promote the erection of twenty-five new churches. The Bishop of Durham, in addressing the meeting, said:—

I think that if we estimate for each church the sum of 3,000*l.* as an average, it will certainly not be regarded as an exorbitant sum. The requirements, therefore, will be 75,000*l.*; but I have put the sum at the minimum, because I don't think it right that a committee like ours, using public funds, contributed as ours will be, ought to run into any lavish expenditure on mere decorations. All we have to do is to erect seemly substantial buildings which will be convenient for public worship, and which will satisfy the requirements of the Commissioners. But I might say, perhaps, in passing, that it would do my heart good if I saw rising occasionally in this diocese, as I see more frequently in the south, some stately and beautiful ecclesiastical edifice which would be a joy for ever—which by its beauty and its solemnity would educate the feelings and stimulate the reverence of generations to come. This, however, must be a matter of private munificence. It does not come within the purview of our committee. We shall be strictly economical in distributing the funds which you shall be pleased to place in our hands. The 75,000*l.* which these churches will cost must be got somehow. We may expect contributions from the Ecclesiastical Commissioners where they have much property, contributions from church building societies, and donations from other sources; but the chief part of it must be raised either by this general committee or by local organisations. I say I think that this general committee ought to strive to raise no less than 50,000*l.* or 60,000*l.* of the money required. I say this for the following reasons:—First of all, I have said nothing about mission rooms. Obviously there

will be a great development in the future in this direction. In the second place, the very idea of this general committee of this central fund is the equalisation of burdens. The richer neighbourhoods will then be able to help the poorer ones. Those who in spiritual things are amply provided for by the generosity and munificence of previous generations ought not to consider themselves absolved from giving because they have no local interest in the districts affected by this scheme. They are especially bound to give because they themselves are reaping the benefits of the gifts of the past. But you will ask, Can we do it? Can we raise this sum? I say emphatically yes—yes, if you have the mind to do it. I was speaking to the Bishop of Rochester the other day. He not long ago, you may remember, put forward a scheme for the building of ten churches, which were to cost 50,000*l.* He informed me within a twelvemonth he had got 42,000*l.* of the 50,000*l.* required. But you will say Rochester is not Durham. Well, then, I will refer you to certain facts in the history of our own diocese. I take the calendar for 1879, which gives an account of the efforts made during the episcopate of Bishop Baring. I find that in seventeen years the sum of 700,000*l.* was raised for building new churches, for enlarging and restoring existing churches, for providing burial-grounds, and for erecting school buildings. Of this 700,000*l.*, 543,000*l.* is set down to the building of new churches, restoring and enlarging old churches—more than 30,000*l.* a year you see. Now, the diocese has been diminished since then. We may say, roughly speaking, that it has lost one-third; but it has certainly been increasing in wealth, and inasmuch as the annual sum which I ask for is very considerably under this, I think that we ought not to hesitate about the matter or feel faint-hearted. But there is another subject for encouragement. We do not enter upon this scheme empty-handed. Certain local efforts had been already made for the erection of some of these churches. Towards the erection of the three Gateshead churches 6,500*l.* has been already contributed. I include in that 1,500*l.* from the Ecclesiastical Commissioners. For one of the Hartlepool churches 1,400*l.* has been contributed, besides the gift of a site. For another Hartlepool church 450*l.* has been subscribed, and for the Crook church about 900*l.* Besides this, there is the church of St. Paul's at Stockton, and there is also the church at Deaf Hill. The amounts contributed in these two cases I cannot tell you exactly; but I hold that there must be already promised for these eight churches between 11,000*l.* and 12,000*l.* For the Gateshead scheme Sir Walter and Lady James contribute 3,000*l.*, Mrs. E. Joicey 500*l.*, Mrs. Carr-Ellison 300*l.*, the rector of Gateshead 300*l.*, Mr. James Joicey 200*l.*, besides a large number of subscriptions of 50*l.* and 30*l.*, and downwards. I turn to the Hartlepool list, and besides the gift of the site, which is valued at 600*l.*, by Mr. and Mrs. Walker, Mr. Thomas Robinson gives 500*l.*, Mr. W. H. Fisher 250*l.*, and Mr. R. H. Young 100 guineas. There are also several contributions which I would like to read, but I cannot for lack of time, of fifty guineas and below. For the Crook church Messrs. Straker and Love give 500*l.*, Mr. John Straker himself adds another 100*l.*, Messrs. Pease & Company give 125*l.*, and there were other donations, some of them very large ones. We have, then, this sum already in hand, but I am glad to say that, without any solicitation, since the general scheme was mooted, several very large, and some of them munificent, subscriptions have been offered. The Earl of Durham has promised a very munificent contribution, but as he will address you presently I will leave it to him to mention it. I can only thank him for his munificence. The Dean of Durham contributes 300*l.*, the Archdeacon of Durham 500*l.* Mr. Carr-Ellison has allocated to Hebburn, one of the churches in question, if I understand rightly, 1,000*l.* I have also received by letter promises of 100*l.* from the following gentlemen:—Mr. Thompson, M.P. for Durham, Sir J. Mowbray, M.P., Mr. R. Vint, Mr. H. Chaytor, and Mr. R. A. Burrell. There is one contribution which I must mention, because it was the first largest offering, and that is a contribution of 50*l.* from the Rev. J. Brown, of Silksworth. The Archdeacon of Durham has just handed me in a promise of a contribution of 50*l.* from Canon Body. I think I mentioned the archdeacon's own contribution of 500*l.*, and I myself intend to give 3,000*l.* That sum includes 800*l.* which has been already allocated by promises of my own to different churches which are to be built; therefore there will only be a contribution of 2,200*l.* to the general fund. Thus I think we start under very fair auspices, and with very good hopes. Strangely, I had omitted to mention one sum which was certainly uppermost in my mind; I do not know how it escaped my lips—that is the donation of 1,000*l.* from the Dean and Chapter of Durham. I think you will see from what I have said that the scheme is a very hopeful one. I hope you will take it up one and all, and I trust there will be contributions in all the churches in the dioceses in aid of it. If I receive sufficient encouragement, and if I am directed by the committee, I shall issue a letter to this effect. In this and in other ways—by the formation of local committees, of which you will hear in one of the resolutions—I do trust that the whole sum may be raised.

The British Museum contains two impressions of New Year cards which date from the latter half of the fifteenth century.

## THE VALUE OF A MONASTERY.

ON Friday, the 4th inst., at the West Sussex Quarter Sessions, the magistrates had before them an appeal from the Fathers of the New Carthusian Monastery, at Cowfold, or as it is better known, St. Hugh's, Parkminster, M. Edouard de Gaulejac, the sub-prior, being appellant, and the Assessment Committee of the Cuckfield Union respondents. The case excited considerable interest in the county of Sussex, not only on account of the novelty of rating religious houses in England, but also from the magnitude and unique character of the buildings, which cost about 200,000*l.*, and stand on an area of upwards of nine acres. On the bench, which was presided over by the Hon. J. J. Carnegie, were the Dukes of Norfolk and Richmond, Sir W. Barttelot, and a number of the leading gentry of the county. There was a large attendance of ladies, who manifested considerable interest in the proceedings. The case lasted the whole day, and scientific witnesses were called on both sides. For the appellant were Mr. J. W. Penfold, of Westminster; Mr. Tewson, of the firm of Debenham, Tewson & Co.; and Mr. Charles Hadfield, of Sheffield, the latter gentleman having to speak more especially to the planning and traditions of the Carthusian and other religious houses. For the respondents were Mr. C. J. Shoppee, architect and surveyor to the Grocers' Company; Mr. Ryde, sen., and Mr. Watney, of the firm of Norton, Trist, Watney & Co. Mr. Lumley Smith, Q.C., was leading counsel for the appellant, instructed by Messrs. Arnold & Co., and Mr. Meadows White, Q.C., for the respondents.

After a patient and exhaustive hearing the magistrates decided upon reducing the rate from 1,750*l.* net to 1,275*l.* net, the chairman remarking upon the unique and difficult nature of the inquiry, and complimenting both sides on the skilful way in which the case had been conducted. By this decision costs will follow the issue. The Carthusian Order flourished in England in the pre-Reformation days, having no less than nine houses, notably the Charter House in London, Shene in Surrey, at Coventry, Hull, and one the crumbling remains of which attest to this day the peculiar arrangements required by this community. We allude to Mount Grace, near Northallerton, whose interesting ruins were visited by the Yorkshire Archæological Society in the autumn of 1882. The rule of the Carthusian Order is well known—daily contemplation, prayer, study, and perpetual silence, the monastery being really a collection of detached hermit cells, each with its little garden, and having a communication into the grand vaulted cloisters and court of over three acres, from which the church, chapter-house, library, and various offices of the abbey are approached. Most of these have vaulted stone roofs, and are handsomely fitted up, precisely as the great monastic buildings of the Middle Ages. The monastery of St. Hugh's will well repay a visit from those persons who are interested in the monastic life and economy of the Middle Ages, and we feel sure that a hearty welcome will await the visitor, for the good monks, though practising themselves severe austerity, extend in the guest-house a kindly hospitality to their visitors, while at the great abbey gate-house the poor are fed daily in large numbers.

## AMERICAN PINE.

A REPORT by Consul H. P. Walker on the trade of Charleston, which has been just issued, contains the following account of the long-leaf pine:—This invaluable tree is known both in the countries which produce it and in those to which it is exported by different names; in the first it is called long-leaved pine, yellow pine, pitch pine, and brown pine; in the Northern States, southern pine and red pine; and in England and the West Indies, Georgia pitch pine. I have preferred the first denomination, because this species has longer leaves than any other eastward of the Mississippi, and because the names of yellow pine and pitch pine, which are more commonly employed, serve, even in the Middle States, to designate two species entirely distinct and extensively diffused. The specific epithet *Australis* is more appropriate than that of *Palustris*, which has hitherto been applied to it by botanists, but which suggests an erroneous idea of the situation in which it grows.

The mean stature of the long-leaved pine is 60 or 70 feet, with an uniform diameter of 15 or 18 inches for two-thirds of this height. Some stocks, favoured by local circumstances, attain much larger dimensions, particularly in East Florida. The bark is somewhat furrowed, and the epidermis detaches itself in thin transparent sheets. The leaves are about a foot long, of a beautiful, brilliant green, united to the number of three in the same sheath, and collected in bunches at the extremity of the branches; they are longer and more numerous on the young stocks, which are sometimes cut by the negroes for brooms. The buds are very large, white, fringed, and not resinous.

The long-leaved pine contains but little sap; several trunks 15 inches in diameter at the height of 3 feet, which I have myself measured, had 10 inches of perfect wood. Many stocks of this size are felled for commerce, and none are received for exportation of which the heart is not 10 inches in diameter when squared.

The concentric circles, in a trunk fully developed, are close and at equal distances, and the resinous matter, which is abundant, is more uniformly distributed than in the other species; hence the wood is stronger, more compact, and more durable; it is, besides, fine-grained, and susceptible of a bright polish. These advantages give it a preference over every other pine; but its quality is modified by the nature of the soil in which it grows; in the neighbourhood of the sea, where only a thin layer of mould reposes on the sand, it is more resinous than where the mould is five or six inches thick; the stocks that grow upon the first-mentioned soil are called pitch pine, and the others yellow pine, as if they were distinct species.

This wood subserves a great variety of uses in the Carolinas, Georgia, and the Floridas; four-fifths of the houses are built of it, except the roof, which is covered with shingles of cypress; but in the country the roof is also of pine, and is renewed after fifteen or eighteen years, a considerable interval in a climate so warm and humid.

A vast consumption takes place for the enclosure of cultivated fields. In naval architecture this is the most esteemed of the pines; in the Southern States, the keel, the beams, the side-planks, and the pins by which they are attached to the ribs are of this tree. For the deck, it is preferred to the true yellow pine, and is exported for that purpose to Philadelphia, New York, &c., where it is in request, also, for the flooring of houses.

In certain soils its wood contracts a reddish hue, and it is for that reason known in the dockyards of the Northern States by the name of red pine. Wood of this tint is considered the best, and, in the opinion of some shipwrights, it is more durable on the sides of vessels, and less liable to injury from worms than the oak.

The long-leaved pine is the only species exported from the Southern States to the West Indies. A numerous fleet of small vessels is employed in this traffic, particularly from Wilmington, in North Carolina, and Savannah, in Georgia.

The stuff destined for the colonial market is cut into every form required in the construction of houses and of vessels; what is sent to England is in planks from 15 to 30 feet long and 10 or 12 inches broad; they are called *ranging timbers*, and are sold at 8 or 10 dollars a hundred cubic feet. From the diversified uses of this wood an idea may be formed of the consumption; to which must be added a waste of a more disastrous kind, which it seems impossible to arrest. Since the year 1804 extensive tracts of the finest pines are seen covered only with dead trees.

Professor Kerr, in his "Physiographical Description of North Carolina," refers to the trees of this State as follows:—

"It will be seen from the United States census tables for 1870, that of its 50,000 square miles of territory, 40,000 are still covered with forests: the range and variety of prevalent and characteristic species of growth, being of course proportioned to those of the climate and soil, are very great. There are, in fact, three well-marked and broadly distinguished forest regions, corresponding to and dependent upon the three geographical sub-divisions, Eastern, Middle, and Western. And while the first section is characterised by a growth common in its prominent features to that in the Gulf States, as the long-leaf pine, cypress, &c., the western or mountain section contains many species familiar in the White Mountains, and in New York. Among the most distinctive, abundant, and valuable species are the pines, oaks, hickories, cypress, and juniper.

"Pines are the predominant growth of the eastern section; there are eight species in the State, the most important being the long-leaf (*Pinus australis*), the yellow (*Pinus mitis*), and the white (*Pinus strobus*). The long-leaf pine is found only in the eastern or sea-coast region; the yellow pine abounds throughout the State; the white pine is limited to the higher mountain regions.

"The long-leaf pine is the predominant growth of the eastern section of the State, and occupies almost exclusively a broad belt quite across the State, and extending from near the coast more than a hundred miles into the interior, covering a territory of near 15,000 square miles. This is one of the most valuable of all trees, on account of the number and importance of the uses it subserves. It is shipped in the form of lumber for civil and naval architecture to all parts of the world, and is unequalled for these purposes on account of its strength and durability. It furnishes the naval stores of commerce, known in all parts of the world; the forests of this State furnishing twice as much as all the other States together. From the rosin of this tree is made the rosin-oil of commerce, and this substance also supplies the southern towns with gas.

"The yellow pine furnishes an important building timber in all parts of the State.

"The white pine is confined to the spurs and plateaus of the mountain and Piedmont regions, being found in great abundance in some counties, and of great size, 3 feet and more in diameter, and 100 to 150 feet high.

"The other species are less widely distributed and less valuable, except the *Pinus taeda*, which, in the Eastern section, sometimes attains a great size, and furnishes an excellent building and ship timber."

Messrs. Wallis & Strang have obtained the order to execute the stained glass windows for the cathedral of Kingston, Canada. There are over one hundred lancet windows.

## NOTES AND COMMENTS.

THE fall of the bridge over the railway near Coppull Station on Sunday, causing the death of several workmen who were about to remove it, should be taken as a warning by overseers and workmen. The North Union Railway, between Preston and Wigan, to which the bridge belonged, was opened for traffic in October 1838. It was laid out by Mr. VIGNOLES, and was the first example of a comparatively cheap line. The cost per mile was about 23,000*l.*, but the gradients were stiffer than on other early railways. The bridges over the railway were made 30 feet in span and 16½ feet in clear height, and they were generally built of stone, with brick arches, but the bridge that fell is said to have been built entirely of brick. It was found when the line was being made that the strata were disposed to slip, and in parts it was necessary to drive piles to protect the banks. This tendency was at Coppull increased by mining operations, and it was evident that the elliptical arch (which was formed of three rings of brick) was becoming flatter owing to the sinking of the abutments. According to the Eastern proverb, an arch never sleeps; but in this country workmen apparently believe that every arch, under all conditions, is as enduring as a pyramid. There was no precaution taken at Coppull to provide against an accident, and although the abutments were insecure and were likely to press inwards, it was ordered that the rings of bricks were to be removed without any care for the consequences. The fall of the bridge is another instance of the folly of trusting to empirical knowledge.

WE lately referred to the dispute between the Stratford-on-Avon Town Council and the Shakesperian scholar, Dr. HALLIWELL PHILLIPS. It is satisfactory to find that the Council have at length discovered the absurdity of their suspicions, and that they have come to a resolution which is tantamount to an apology. It states that the Corporation, "fully sensible of the interest taken in their ancient records by Dr. HALLIWELL PHILLIPS, and gratefully acknowledging the important services rendered by him at various times in regard to them, desires to express its regret that he has thought it necessary to abandon the work entered upon in autotyping the records of a special interest, and the Corporation desires to say that the confidence it has always placed in Dr. HALLIWELL PHILLIPS has never been withdrawn, and trusts that arrangements may be made by the newly-appointed record committee which will enable him to resume his valuable services to the Corporation." Whether Dr. HALLIWELL PHILLIPS will renew labours which entailed great expense to him remains to be seen.

THE Act by which the trustees of the National Gallery are enabled to part with some of the pictures belonging to the collection, and which have been purchased or bequeathed, has been put in force. Four modern works have been sent to the National Gallery in Dublin. The first is *A Dialogue at Waterloo*, by Sir EDWIN LANDSEER, in which the old Duke is seen explaining the battle-field to his daughter-in-law, the Marchioness of DOURO. It was one of the most popular pictures at South Kensington before the removal of the VERNON Collection to Trafalgar Square. The second picture, *A Peep o' Day Boy's Cabin*, by Sir DAVID WILKIE, will be better appreciated in Dublin than in London, and may serve as a warning there. The third is the small, but very rich picture, *The Duet*, painted by WILLIAM ETTY in 1838; and the fourth is one of MULREADY's best works, *The Young Brother*. The removal of the last was not contemplated when the Act was passed.

MR. KIRKALDY, of the Southwark Testing and Experiment Works, lately received an order to supply the Technological and Industrial Museum of New South Wales, Sydney, with a collection of specimens illustrative of the mechanical properties of various kinds and qualities of the materials used in construction. The collection is now completed, and consists of three hundred and thirty specimens representing various qualities of steel and iron, from the hardest to the softest manufactured, in the form of wires, bars, sheets, plates, angles, tees, channels, rails, tyres, axles, shaftings, and forgings, tested under pulling stress. Cards accompanying each specimen give the elastic and ultimate stress in pounds per square inch, contraction of area at fracture, extension at 40, 50, 60, 80, or 100,000 lbs. per

square inch, and the ultimate extension. The collection also contains specimens of steel and iron, tested under thrusting, bending, twisting, shearing, and bulging stresses; specimens of copper, copper alloys, steel and iron castings, granite, marble, stones, cement, wood, chains, hemp, manilla and wire ropes, rivetted joints, welded joints, cards with the results of the tests accompanying each specimen. Two somewhat similar collections were supplied to the Imperial Colleges of Engineering, Japan. The samples are now on view, and with those to be seen in Mr. KIRKALDY's Museum of Fractures, are well worth a visit from everyone who takes an interest in the strength of materials.

THE Bewick Club will hold an art exhibition in Newcastle-on-Tyne on the 18th inst. An art union has been established in connection with the exhibition, under the sanction of the Board of Trade, and its objects are, by distributing works of art by means of a lottery amongst the members of the association, to aid in extending the due appreciation of the fine arts among all classes, to offer to artists encouragement beyond that afforded by the patronage of individuals, and to promote the success of fine art exhibitions to be held annually in Newcastle. The price of the Art Union tickets is 10*s.* 6*d.*, and the whole of the money will be given in prizes, excepting the smallest possible outlay for management. Winners will choose their own prizes at the Newcastle exhibition. The management of the exhibition has been undertaken by the Bewick Club, not with the intention of making it a means of displaying the works of the members only, but with the object of making it a general exhibition, open to all artists, for the benefit of the public. The local artists and members of the club will, in regard to the pictures exhibited, be placed on precisely the same footing as other artists who have been asked to send works.

THE Corporation of Aberdeen have been fortunate in obtaining the matrices of the old seal of the city, which bears the date A.D. 1430. In Mr. HENRY LAING's book on "Ancient Scottish Seals," it was said that the matrices had been picked up among a heap of old metal in a broker's shop, and were in possession of a Mr. SMITH. Inquiry was made, and they were discovered, and fortunately in an excellent state of preservation. The possessors, on being informed of the nature of the object, at once presented the seal to the Corporation.

DREDGING operations have been carried on in the Thames between Boulter's and Hambleden Locks for some months past, and have resulted in many very interesting antiquarian discoveries. They include a bronze sword and several flint hatchets, some chipped and others polished. A Franciscan (iron) axe and a greenstone axe were found in the river at Taplow Mills, also an iron axe (carpenter's) of about the fifteenth century. On the north side of the main road to London, between Taplow Station and the One Mile House, on the rising ground called Windmill Field, there has been from time to time unearthed much of great archæological interest, and, in what appear to be pit dwellings, about 3 feet deep and 15 feet in diameter, are found earthen cups of the rudest description, both in make and material. In one of these depressions was found a flint chip, polished on one side, which may be accounted for as being a chip pitched off from a broken hatchet in the re-cutting. A large cinerary urn containing Roman remains was found buried on the outside, or a few feet from what appears to have been a double line of defence; at about 25 feet apart, there are ditches about 2 feet 6 inches deep, and on the top of the bank thrown up would probably be fixed the stockade. From frequent observation and existing indications it may reasonably be supposed that this terrace level continuing on to Bury Hill was an old occupation site, skirting the then dense forest behind, and immediately in front would have been the sloping bank of the then wide river, extending to the Berkshire Hills, some six miles distant. In October 1837, during the progress of the works on the line of the Great Western Railway, on this same terrace two very rude urns of unbaked pottery were found, about two feet below the surface, the smaller 3½ inches high, and the same in diameter, containing a number (not exactly ascertained, but said to be from 400 to 500) of Roman silver coins. They are supposed to have been buried in the reign of AURELIUS, or early in that of COMMODUS.

DESIGN FOR ROOFING QUADRANGLE, ROYAL EXCHANGE.

THE design for roofing the interior court of the Royal Exchange, by Mr. CHARLES E. POWELL, of the firm of Messrs. MEDLAND & POWELL, 89 Chancery Lane, was one of those submitted to the Honourable the Gresham Committee in the autumn of last year, and was one of the three selected by the surveyor to the Committee. It was designed so as to harmonise with the existing building, to interfere as little as possible with the lights of the rooms looking into the court, and to allow of easy access to the glass for cleaning and repairs, which latter advantage was secured by each of the cross-beams being planned to carry wide gutters forming footways, light glass and iron roofs, covering the inner glass ceiling, running between them from side to side. The iron-work was planned to be cased with ornamental wooden mouldings and brackets, covering the arched form of the girders, the arrangement of which, each following the line of the existing columns below, is shown in our illustration.

DESIGN FOR AN ACADEMY OF ARTS.

WE publish reproductions of the drawings by Mr. E. G. HARDY, which gained the Gold Medal and Travelling Studentship of the Royal Academy. It was anticipated that the competition was to be well contested, and the designs submitted were exceptionally good. Mr. HARDY's success is therefore the more creditable to him. It will be seen that in the design there is no trace of the style that happens to be in vogue. Mr. HARDY has employed a style that is better deserving of approval, and his treatment of it shows how well he has mastered the principles of the great Italians.

## THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association was held on Friday evening, the 4th inst., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members:—Messrs. F. A. Cox, J. H. Roadhouse, T. B. Simpson, C. H. Wainwright, W. Shoebridge, W. E. Hill, G. Nelson, J. B. Thorp, W. Hall, S. E. Coles, M. J. Grummond, F. M. Thin, A. J. Phillips, H. B. Measures, C. Loveband, A. Migotti, F. T. Verity, W. R. Wilson, J. R. Morgan, E. L. Conder, T. E. Key, C. G. Baker, W. C. Carlile, J. T. Perkin, E. T. Gover, and H. H. Moses.

Mr. J. A. REEVE then read a paper, of which the following is a condensed report:—

## Fountains Abbey.

On making a careful comparison of many Cistercian abbeys we find that the general disposition of all the main buildings, namely, those surrounding the cloister court, is almost identical in every case, so much so in fact that it is possible, as the late Mr. Sharpe has shown, to give a typical ground plan which shall be a fairly true representation of the Cistercian abbeys built before the year 1200. This early arrangement of the buildings is still almost perfect at Fountains, the only alteration made being in the choir of the church, which, during the first half of the thirteenth century, was reconstructed on a grand scale. During excavations made about thirty years ago, the foundations of the original choir were found, which show that when first built Fountains was no exception to the rule then general throughout the Cistercian Order. The cloister court forms almost a perfect square in the centre, and round this are placed, most conveniently, the various buildings in the following order:—The whole of the north side is occupied by part of the nave of the church, which also extends westwards beyond the domus conversorum. The east wall is formed by the west wall of the south transept, the chapter-house, and a small portion of the frater. On this side also we find a sacristy between the church and the chapter-house, and a passage between the latter and the frater. These are generally to be found always more or less nearly in these respective positions. On the south side are the kitchen, refectory, and buttery, and at the eastern end between the frater and kitchen is placed the staircase leading to the monks' dormitory, scriptorium, &c., on the first floor. The west wall of the cloister is flanked by the northern part of the great building destined for the use of the conversi, or lower order of monks, who, like their superiors, had a day-room on the ground-floor as large as the dormitory above. Of these several buildings the church and the chapter-house run east and west, and the frater, refectory, and domus conversorum run north and south.

The original church at Fountains before it was altered was a good type of the earliest form of Cistercian churches, describing on plan the shape of a true Latin cross. The nave was long, and the chancel, north and south arms of the transept, all short and of about equal lengths. The nave had aisles which opened into the transept, but these aisles were not extended to the choir. The

transept, however, is provided with chapels projecting from its eastern wall that flank the choir for about half its length but do not communicate with it. The choir itself and all the transeptal chapels are square-ended, as at the mother abbey of Cîteaux. It was the almost universal practice of English mediæval architects to adopt the square east end; but that it should have been used at Cîteaux and other early Cistercian churches in France, is, I think, exceedingly interesting. It was a marked departure from precedent when the monks of Cîteaux built their church with a square end, and one cannot help recollecting that the prime mover of the reform was an Englishman, who, it may have been, retained a predilection for the square-ended churches of his mother-country, and induced his followers to adopt this sterner form. I am much inclined to believe that the square-ended church was to the Frenchmen of that day a definite external sign of the severe life of self-abnegation they were desirous of leading.

The rules that bore on the construction and decoration of Cistercian churches were then read by Mr. Reeve, and among them two relating to towers and bells, viz., "Let not stone towers for bells be built, nor wooden ones of immoderate height, for they detract from the simplicity of the Order," and "Let the bells of our Order be so managed that one only shall be struck at a time, never two together." I believe, Mr. Reeve went on to say, many of the French Cistercian churches show signs of having originally possessed wooden bell-turrets; in England, however, even from the earliest times this rule seems to have been neglected, for at Kirkstall, founded in the year 1145, the lower storey of the tower over the crossing is of the same date as the rest of the church, and at Fountains there are evident signs of the same sort of low twelfth century stone tower having once existed.

The choir of an early Cistercian church is always short, but in the thirteenth century, a little more than one hundred years after the foundation of the Order, they got tired of this restriction, and in England as well as in other countries we then find Cistercian choirs of considerable proportions. Looking at the plan of Fountains, for example, it will be seen that the area of the choir, as reconstructed during the first twenty-five years of the thirteenth century, with its eastern transept called the Chapel of the Seven Altars, amounts almost to the area of the nave and transept. This late choir is also provided with north and south aisles, one of the original transeptal chapels on each side having been destroyed to admit of this. In some ways the extension of the choir must be looked upon as an improvement, but anyone who has seen the original twelfth-century choir at Kirkstall must have been impressed with its solemn grandeur, which seems to harmonise better with the rest of the abbey than does the extensive choir of Fountains. Among the sketches hung on the walls is one showing my idea of the exterior of the original choir of Fountains Abbey, with the central tower and north transept. A second sketch shows the interior of the existing choir restored.

The exterior of the nave consists merely of a row of semicircular clerestory windows above, and a row of similar aisle windows below, divided from one another by the rather shallow aisle roof. Pilasters of slight projection divide clerestory and aisle into bays. The interior of the nave is not less severe than the exterior; the nave arches moulded in the simplest manner possible are supported on plain cylindrical columns with shallow capitals and bases, and between the arcade and the clerestory there is merely a piece of blank wall surmounted by a plain bull-nosed string course, upon which the jambs of the inner arches of the clerestory windows rest. Everyone must recognise it as first-rate architecture, notwithstanding its almost childish simplicity. It seems probable that the nave and transept were covered by means of semicircular wooden ceilings, but the original choir was probably vaulted in stone as at Kirkstall. The nave aisles had stone roofs of a peculiar character: transverse semicircular arches springing from corbels inserted about two-thirds up the nave piers, and at a similar height on the aisle walls, supported transverse pointed barrel-vaults which followed the line of the main nave arches. It was, in fact, little more than a prolongation of the nave arch to the aisle wall.

In addition to the extreme simplicity of form in the plan and elevations of the church, we find that the interior decoration of the building was equally simple. At Fountains Abbey, notwithstanding more than three hundred years of exposure to the inclemency of a Yorkshire climate, much of the mural decoration of the church still exists. It is of the plainest description, merely red joint lines on a white ground. With these red lines the whole surface of walls, piers, and arches seem to have been covered. Some of this jointing belongs evidently to the twelfth century, while some of it must have been done quite three hundred years later, showing that the ancient rule of simplicity in the matter of painting did exercise considerable repression even to the last days of the Order. In the whole abbey I only discovered the remains of one small fresco. It is on one of the piers on the south side of the nave, and probably formed part of an altar-piece. It appears to have been executed in monochrome.

At the west end of Cistercian churches there is often found a portico or narthex extending along the whole length of the western façade. Its primary use is doubtful, but it was used at Fountains, and I do not doubt elsewhere also, as a place of sepulture—I should

think very likely for noble personages of the laity wishing to be buried near the church, within which the strict laws of the Order would not admit them. The Cistercians were amongst the first to make use of the pointed arch, and it is particularly worthy of note that they used it first, not for the more decorated features, such as windows, doors, and arcadings, but without exception for the main arches of construction, such as the arches of the nave arcade, the great arches at the crossing, and for the transverse ribs of vaulting. This seems to me to be a conclusive argument against the theory that the pointed arch was discovered by the chance intersection of two semicircular arches in Norman arcading. I believe, on the contrary, that it was adopted on constructional motives, from the recognition of the fact that a semicircular arch without a keystone is inclined to be weak, while with a keystone it necessitates a different mode of treatment from what our eleventh and twelfth-century ancestors were willing to adopt.

On leaving the church by the cloister door, and walking south, we first come to what now looks like a vaulted passage. It was originally divided into two separate apartments, of which the eastern one was the sacristy, with a private entrance into the south transept of the church, and the western one seems likely to have been a cell, which, in after years, came to be used as a charnel-house. Next comes the chapter-house, which, like most chapter-houses of the Order, is a long parallelogram divided into three aisles by two rows of pillars running east and west—an elaborate piece of architecture; it was vaulted throughout with rich stone vaulting, supported on corbels against the walls and the columns before named. The latter, with their caps and bases, were of polished marble. The chapter-house was entered by three great archways leading directly into it from the cloister; and as the archways never had doors, and the cloister was not glazed, the chapter-house was virtually open to the outer air. The memorial slabs of several abbots remain, and the bases of three tiers of stone seats running round the walls. As these are interrupted at the east end of the centre aisle, I am inclined to think that the abbot's chair stood in this position, and was of wood. Next to the chapter-house is a richly-vaulted passage leading directly to the abbot's house and various other buildings to the south-east of the central block. Then follows the frater—a low and dismal building running north and south. The northernmost bay overlaps the cloister, and was divided off from the rest of the apartment. It had a doorway at each end, one communicating with the cloister court, and the other with the base court. The part thus cut off from the monks' day-room may have been a locutorium. The wall which originally separated it from the frater is now demolished, but it is plain it once existed. Here it was evidently an after-thought; but it generally forms one of the separate rooms in a Cistercian abbey. The frater itself is a low-vaulted room, divided into two aisles by a central row of columns. It was lighted by two windows at the south end; there was no other natural light, but possibly lamps were kept burning at the north end. Above this day-room was the dormitory, reached by stairs still existing between the frater and the kitchen. A passage led direct from it into the south transept of the church. The scriptorium, also reached from this passage, was over the four eastern bays of the chapter-house; only three outer walls remain of it. The height of the roof of all these buildings is given by the line cut in the face of the south transept to receive the flashing. Though the chapter-house and frater were only two or three years later in date than the nave and transept, and must have formed part of the original design, the roof-line was allowed to cut in the most careless manner across the windows of the transept.

On the south side of the cloister court the kitchen comes first, a fine lofty room, oblong, vaulted, and divided into two bays each way, with a massive pier supporting the ribs in the centre. In the eastern wall are two fireplaces, the openings occupying the whole width of one bay each. They are more than 16 feet wide by 6 feet 6 inches high, and are square-headed, the lintels formed by flat arches of joggled stones, 4 feet 9 inches deep. The kitchen was lighted by two large windows in the south wall, in which was also a door giving access to buildings between the frater and the refectory, probably sculleries, fuel-houses, &c. In the west wall are two openings, cut after the completion of the buildings to form hatchways into the refectory. In the north wall there is only the doorway leading into the cloister court.

In the centre of the south wall of the cloister stands the noblest of all the conventual buildings, the refectory, 109 feet long by 46 feet wide, and divided into two aisles by a central row of marble columns. Unlike all the other buildings in the abbey, this room was not vaulted, but seems to have had two parallel wooden ceilings, arched in form and lofty. The seats were of stone, arranged round the east, south, and west walls, and the tables had stone uprights. The pulpit is clearly traceable on the west side, the doorway and flight of stairs leading to it in the thickness of the wall are perfect, and inside the doorway is the locker in which the books were kept. At the north end of the west wall is a doorway with curved sides leading into the buttery, and suggesting that here stood a turn-table, from which each monk took his rations as he entered the refectory. There are remains of the lavatory along the south wall of the cloister on each side of the refectory doorway. Its form is that of a long trough. One-half of the whole

length still remains, and it is evident by the deposit of lime adhering to it that it was always kept full of water. The holes for serving-pipes and waste-pipes still exist. A ledge runs along behind the trough, upon which probably brass reservoirs with taps were placed, for our forefathers washed their hands over a basin rather than in it.

The design of the domus conversorum follows very much the lines of the frater, being a long, low, vaulted day-room, with dormitory above, but much larger than the frater, being no less than 300 feet long by 41 feet wide, and originally divided probably into two parts at least. The southern end has evidently from the number and size of its windows been used as a workshop, while the northern end was a kind of lobby in which those who went out to work in the fields, stables, &c., mustered. It has been thought that the eastern aisle of this northern part was used as a store-room, though more probably the whole of the space would have been wanted for the conversi in winter evenings after work was over. There are four large doorways in the western wall of this part, and two small ones evidently to allow the conversi to get rapidly out of the house on leaving the church after early service. At the north end of the western aisle there is a large door leading directly into the south aisle of the church. On the western side, and about the centre, is a little room with a fireplace, over which are steps leading to the dormitory. This room, no doubt, was inhabited by the magister conversorum. The dormitory, as large as the day-room below, was lighted by narrow round-headed windows throughout its length on each side; a flight of steps at the northern end leads down to the south aisle of the church. The dormitory was not vaulted; there were therefore no columns down the centre. Mr. Reeve concluded his paper with a reference to the other buildings connected with the abbey, the more important being the abbot's house, the hospitium, infirmary, gate-house, mill, &c.

Mr. F. T. BAGGALLAY proposed a vote of thanks to Mr. Reeve. The paper, he observed, had been mainly archaeological, and hardly afforded matter for argument, as would have been the case had the question of possible restoration been treated of. Mr. Reeve had spoken of the influence that the life led by the monks had exercised on their buildings. This fact was not a little calculated to cause despondency with regard to the present prospect of architecture, because our present life and tastes were so different from the pure tastes and severe lives of those monks that we could never produce naturally such simple work as they did. The luxury of the day tended also to luxury in building. The failure of the Gothic revival was due to the fact that the nineteenth century was luxurious to a most unprecedented degree, so that the buildings of the thirteenth century could not be accommodated to the wants of our present life.

Mr. MILLARD seconded the vote, and said it might not generally be known that Mr. Reeve had measured the whole of the buildings, down to the stone joints, with the object of preserving an exact record of them in their existing state.

Mr. A. B. PITE, Mr. W. H. PRATT, and Mr. STOKES supported the vote, which, on being put to the meeting by the President, was unanimously carried.

Mr. REEVE, in acknowledging the compliment, said that the owner of the abbey, Lord Ripon, had wished that the drawings, &c., of the abbey should be made as accurately as possible. Time and money for the purpose had not been stinted.

## THE SHREWSBURY SHIREHALL.

AT the last Shropshire Quarter Sessions, the Shirehall and A Judges' House Committee stated that they were glad to lay before the Court the following very satisfactory report of Mr. Thomas M. Lockwood, the architect, relative to the progress and final completion of the building:—

"I beg leave to report upon the condition of the works now being carried out at the new Shirehall Buildings under my direction. The whole of the works may now be considered complete, with the exception of the painting and decorating, which have been somewhat retarded owing to the time of year and the difficulty attending the completion of such works before the walls of the buildings are perfectly dry. Mr. Warburton, the contractor for the main building, has completed the whole of his work with the exception of the new doors and screen in the front hall, and has done his work in a sound, substantial, and satisfactory manner. The whole of the furniture is also completed and delivered to the building, and this work also reflects credit upon the contractors, Messrs. W. & F. Brown & Co., of Chester, and Messrs. White & Co., of Shrewsbury."

The Chairman said he was sure the Court would receive with satisfaction the report relative to the completion of the works in the new Shirehall. The whole of the work reflected very high credit not only upon those who had been actually engaged upon it, but also upon the architect, Mr. Lockwood, who had designed the Courts and superintended the works. The payments for the Shirehall had not been so large as they expected at the October Sessions, when it was estimated that 4,000*l.* would have to be paid during

the quarter. But that had not been the case, and so it had only been necessary to borrow 2,000*l.* The total amount at present raised on behalf of the Shirehall was therefore 18,100*l.* Mr. Lockwood thought that during the next quarter they would be able to clear everything up, so that the committee hoped to be able to present the whole of the accounts, properly made up, at the Easter Sessions; and they had heard that the sum of 3,000*l.* would probably be sufficient, including the balance they had in hand.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE ninth annual report of the Birmingham Architectural Association states that during the past session there has been a considerable increase of both ordinary and honorary members, and that the session was the most successful the Association has enjoyed since its inauguration. But the committee wish at the same time to urge upon the members the necessity for continued and increased individual effort, so that the true object of the Association may be attained and the profession generally benefited thereby. The ordinary meetings held during the session were more largely attended than at previous sessions. Papers were read on the following subjects, viz.:—"Hearts in our Art," by Mr. Norman Gething; "Surveying," by Mr. H. Clere; "Home, Sweet Home," by Mr. W. Henman; "Some Errors in Construction," by Mr. J. M. Gething; "Architectural Revivals," by Mr. J. W. Tonks; "Sculpture: What it was, What it is, and What it will be," by Mr. J. Roddis; "Notes on Sketching Tour from Belgium to Heidelberg," by Mr. A. Reading.

Archæological and sketching excursions were made during the session to Knowle, Packwood, Hagley, and Clent. The classes were more numerously attended, but the committee would impress upon the younger members the benefit to be derived from contributing papers and preparing designs. The designs contributed were fairly satisfactory. The construction class papers received were few in number, but each set of questions was discussed with great interest.

The programme for the session 1883-4 contains several interesting papers, and the committee wish to draw the especial attention of members to the essay prizes offered this session by the President and Mr. C. A. Harrison respectively.

### THE ADORNMENT OF SCHOOLS.

A PAPER on "The Interior of the Schoolroom: Fittings, Apparatus, and Æsthetic Adornment," by Mr. J. Matthew, was read at the congress of the Educational Institute of Scotland. The author said that the dealing with financial questions might obtain for School Boards more popularity among a certain class of ratepayers, but in attempting to improve the health, comfort, and happiness of the teachers and the pupils they would reap a far richer reward, and would leave behind them a grateful remembrance which time could not efface. It was a great mistake to lay the floors with white wood; it might be cheaper at first, but, like other cheap things, it was discovered to be the dearest in the long run. These, as well as the desks, should be made of the best pitch pine. School Boards would confer a real benefit upon the children by erecting a large lobby or entrance-hall in connection with their schools, with a fireplace or stove. Here, in the winter time, the pupils might take off their boots and have them dried before starting on their homeward journey—the pupils being encouraged to bring slippers with them to school. Mr. Matthew advocated the establishment of school libraries for the use of the advanced pupils. In this connection he also expressed the hope that ere long every child almost, on reaching the age of five years, would be found in the infant rooms. A child lost a very valuable portion of his education who lost his infant training. Seven years was certainly a very tender age to present children in any standard, and it might be that the Department might relax this rule and fix the eighth year instead. This would ease much of the burden that was now causing such mischief and dissatisfaction. On the question of the æsthetic adornment of schools, he said the grand aim of all earnest teachers was to make the school life of the pupil a healthy, cheerful, and active one, and this was to be accomplished by making the surroundings agreeable. Here much depended on the individual exertions of the teacher himself. If he were a man of taste he would make his influence felt in this direction, because he could not be happy if the elements of discord existed to mar the harmony of his own life. By a judicious arrangement of the materials at his disposal, such as maps and illustrations, he might cause his rooms to assume a bright and inviting appearance. In summer they all had command of gardens or wild flowers, and what could be sweeter in a room than a flower-glass filled with these beautiful children of nature? If the teacher once began to decorate, many willing hands would gladly assist. An engraving from one, a few plants or flowers from another, would brighten the interior of many a school, which

might thus become a centre to radiate gentle influences into many a home.

Miss Blyth spoke of the desirability of school managers being consulted by architects as to interior arrangement of school buildings when preparing plans.

Dr. Morrison, in moving a vote of thanks to Mr. Matthew for his paper, said this subject was attracting more and more attention every day. A great deal was said about the brutality of people in the large towns; but by following the suggestions of Mr. Matthew a great deal might be done to train children to observe those little courtesies which one child should pay to another, to the improvement of the moral part of their nature. On the whole, they had reason to be thankful for the progress that had been made in the main direction of Mr. Matthew's remarks, and if School Boards had done nothing more than build and equip schools in the way they had done, the country had reason to be grateful to them.

### THE DWELLINGS OF THE POOR.

A PAPER on the subject of dwellings for the poor was read by Dr. H. Page at the meeting of the Birmingham and Midland Officers of Health. It was said that the problem was certainly a complex one. The President of the Local Government Board said, "the wretched condition of the dwellings of the poor is only one incident in the general condition of a large part of the population; poverty, ignorance, and crime are other factors." Consequently the remedies must be manifold; there must be a more stringent application of the existing sanitary legislation, supplemented by some further legislation, as well as philanthropic and Christian efforts, and general and sanitary legislation. The remedy was beyond private enterprise alone, emigration, or even State aid, as some would wish to believe. Fresh legislation had been looked upon by some as the favourite specific of the shallow reformers who had neither time nor patience to examine whether an adequate and sustained exercise of existing powers might not prove sufficient. But the present legislation had already proved inefficient, inasmuch as it had allowed the present condition of things to continue and increase. Most of the chief sanitary laws contained flaws which form playgrounds for almost endless and expensive legal tournaments. It could not but be recognised that all kinds and degrees of insanitary conditions of dwellings existed in the small towns and country places, as well as in the cities and large centres of population; yet in the former, owing to the influence of vested interests on the sanitary authorities, and the absence of any really organised sanitary supervision, the condition of things remained unchanged. Special legislation was wanted to deal efficiently with existing dilapidated property, and building by-laws should be extended to the entire country, and some reasonable means of enforcing penalties on the local authorities for omissions of statutory sanitary duties should be brought into use. Again, legislation was required to remedy the present method of setting in operation such Acts as the Artisans' Dwellings Act of 1868, and to abolish the absurdity, under the Artisans and Labourers' Dwelling and Improvement Act of 1875, of the rates having to provide fancy values for death-dealing properties. The principle of enforced remedy by the sanitary authority, with the option of purchasing from the owner at a fair price, should be extended to all urban sanitary districts. If Sir Charles Dilke intended, as he announced he did at Birmingham, to utilise the provisions of the old Sanitary Act of 1866, its application should be made universal and compulsory. Volumes existed on the legal rights of property, which were rigorously enforced, but they wanted a few legal compilations on the duties of property, with a workable scale of penalties for omission of the same. A dwelling on being let ought to be statutorily assumed to be in good sanitary condition, healthy, and not to contain any disease or death-dealing contrivances. Sanitary authorities, in any future house legislation, should be compelled to keep a register of the plans and exact sanitary conditions of all dwellings within their district, available for inspection to any intending resident. No dwelling should be allowed to change hands or be relet unless inspected and certified by the sanitary authority. For this a small fee or scale of fees might be chargeable, and the applicant should be able to readily enforce statutory penalties on the sanitary authority for proof of statutory sanitary defects or omissions. In the case of tenement houses, or those frequently changing residents, quarterly inspection and certification should be required. They had to consider whether, when once a legal decision was given on any point, it should not be codified by the central sanitary authority, communicated officially to all sanitary authorities, and an appeal to such to be held to be conclusive, and to stop any further litigation on the same question in any place in all courts of law. Undoubtedly fresh legislation on the subject of insanitary dwellings should not be spasmodic, but should, as Lord Salisbury put it, proceed with caution. But at the same time it would have to be stringent, effective, universal, and in a sense undoubtedly confiscatory, since a fair deduction even upon the property's intrinsic value ought in justice to be made on account of the cost already entailed on the community by preventible sickness, disease, and death caused

thereby. Seeing that whatever legislative course was adopted, the sanitary inspectors, and particularly the medical officers of health, would play an important part in the matter, it became a question to consider whether it would not be wiser, whilst striking at the root of the insanitary dwellings evil, to go also to the root of the failure of the existing sanitary organisation, and in one non-piecemeal act of legislation—including the principles of Mr. Chamberlain's recommendations—give a comprehensive and workable Public Health Act.

### THE GREENOCK MUNICIPAL BUILDINGS.

IT was reported at the last meeting of the Greenock Town Council that fifty-eight tenders had been received for the works on the third section of the new municipal buildings, which were remitted to the measurer for report. The Municipal Buildings Committee expressed dissatisfaction with the dilatory way in which the various works in connection with sections 1 and 2 are being proceeded with, and agreed to desire the architects to furnish a report on the progress of the work each fortnight in place of monthly as at present. The Provost, in moving the adoption of the minutes, said the estimates for No. 3 section (a continuation from Hamilton Street to Dalrymple Street) were about 27,000*l.*, being 3,000*l.* under the architects' estimate. He considered this was a favourable time for entering into contracts, but before deciding he thought it was proper that a statement of the probable cost of the buildings should now be laid before the council. The original estimated cost of the entire buildings submitted by the architects, and confirmed by Mr. Barry, architect, London, was 80,000*l.*, with 58,000*l.* for the ground, making a total of 138,000*l.* Including the estimate for section 3, the amount to be expended would now amount to 169,000*l.*, and adding interest capitalised and other charges, the total estimated cost of the buildings would not be less than 180,000*l.* After detailing the various sums, he moved that the committee consider the estimates for section 3, and report to the council whether they consider that section should now be proceeded with.

After a discussion, in which some of the members complained of the great delay which had taken place in completing the other two sections, and that the probability was that the shops in the section in Hamilton Street would not be ready at May for occupancy, the Provost's suggestion was unanimously adopted.

### THE ARCHITECTURE OF A BONE.

A LECTURE was delivered last week at the London Institution on "How a Bone is Built," by Mr. Donald M'Alister, of St. John's College, Cambridge. The lecturer explained that he would treat the construction of a bone as a question of architecture or engineering rather than of anatomy. In looking at an ordinary marrow-bone two points would strike one. In the first place, the shank or shaft of the bone was hollow, forming a somewhat thin-walled tube; secondly, the end of the bone next the joint appeared on section to be not hollow but filled with a spongy or "cancellous" meshwork of bony tissue. The tube-form appeared not only in bones but in many other structures characterised by combined lightness and strength—such as the stalks of plants, reeds, bamboos, quills of feathers; and among human constructions in a vast variety of shapes, from tubular bridges to backbones of bicycles or tricycles. What was the common principle underlying all these manifold varieties? Why was it that, weight for weight, a hollow column was so much stronger than a solid one? The lecturer then showed that when an ordinary rectangular cross-beam was slightly deflected by a load, the upper fibres were in a state of compression, while the under fibres were in a state of tension; whereas in the middle of the beam there was a neutral region neither compressed nor stretched. For load-bearing purposes this region might be removed; the beam would thereby be made appreciably lighter but not appreciably weaker. The tube-form of a bone was thus due to the fact that the material was concentrated at those parts which were most under strain and where it was most useful; it was removed from those parts where it added to the weight without adding to the strength. Tables were exhibited from which it appeared that bone in its physical properties resembled steel much more than such a material as cast-iron. Bone, like steel, was almost as strong to resist tearing as to resist crushing. The spongy or cancellous ends of bone were next considered, and by photographs of actual specimens the lecturer showed that the apparently confused and irregular character of the tissue resolved itself on examination into a very beautiful and harmonious regularity. In the construction of such great structures as the Forth Bridge and the large cranes seen at the docks, engineers had found it useful to investigate the lines of the structure along which the pressure or the tension was at a maximum; these lines might be called stress-lines *par excellence*. The material at disposal was most economically arranged when it was concentrated along these lines, leaving empty the mesh-like spaces corresponding to the neutral region of a cross-beam. A skeleton

or lattice framework might thus be built up, having all the strength of a solid structure of the same shape or loading, but with much less expenditure of substance. Such a structure would, moreover, be free from the danger of giving way by "shearing" or "faulting" in the geological sense. In other words, its parts would have no tendency to give way by sliding or slipping over each other; they could only be directly crushed or directly torn asunder. This was, therefore, an ideal mode of building such structures, and it was only because skilled workmanship was more expensive than material that engineers did not oftener put it into practice. In bone building, the lecturer said, there were no such obstacles in the way of perfect construction, and in such a part as the head of the thigh-bone the principle was carried out in ideal perfection. The cancellous network in this bone was a material embodiment of the engineer's ideal lattice-work of true stress-lines, so much so that in the Zürich School of Engineering thin sections of the thigh-bone were placed before the pupils as the best possible illustration of the true principle of construction. In conclusion, the lecturer remarked that when such instances of adaptation as appeared in the eye and hand, and perhaps he might now add the common marrow-bone, were brought before us we were filled with wonder, and some saw in them evidences of what was called direct design. These evidences might nowadays be interpreted in perhaps a worthier and grander sense, but the wonder would remain for all who had eyes to see. At any rate, apart from all theology, and taking only the strict architectural sense of the words, we must agree that a marrow-bone was well and admirably designed.

### STRUCTURAL IRONWORK.

THE report on engineering trades by Messrs. Matheson & Grant gives the following information on the business of the past year in bridges and other structural ironwork:—The output of bridges during the past year has been very great, but the extension of factories and the introduction of labour-saving processes have so increased the power of production that contracts are more quickly executed than formerly, and the slightest lull in the giving out of new orders is immediately felt. Prices remain unaltered, except as they follow alterations in iron and steel. From 13*l.* to 16*l.* per ton for iron bridges, and 15*l.* to 20*l.* for steel bridges, are inclusive rates. Numerous bridges of very large size are being built, and many more are projected in India and the colonies, the successful construction of deep-water piers and long span girders giving special encouragement to engineers. Steel is gradually being employed for small as well as large structures, especially where heavy loads have to be carried, as it is becoming evident that the advantages of steel are not confined to cases where the total cost can be brought down to that of iron by a reduction of weight, but are to be obtained by maintaining the same, or nearly the same, weight, the additional strength so gained being much greater than the additional cost. Steel can be bought at an increase of only 20*s.* to 30*s.* per ton above the price of good quality iron, the exact proportion between the two being mainly determined by the distance for carriage. And as the ductile steel with a breaking strength not exceeding twenty-eight tons per inch, which is now used for structures, can be as easily worked as iron, and by the same machinery, bridges and roofs can be bought for about 2*l.* per ton above the prices of iron structures of the same form and weight, though the difference is, of course, greater if the steel is in competition with low quality iron.

### THE GLASGOW FIRE.

THE following communication on the recent fire has been presented to the Town Council by some of the leading merchants in Buchanan Street:—

The fire which broke out on the evening of November 3 last, at No. 38 Mitchell Street, Glasgow, and which developed into one of the most serious conflagrations that has ever occurred in the city, involving the total destruction of Wylie & Lochhead's premises, the partial destruction of several properties adjoining thereto (although separated by complete party walls), and serious damage to the buildings and their contents in the blocks extending to north side of Mitchell Lane, west side of Mitchell Street, and towards Argyll Street—a space over 600 feet long by 230 feet in breadth, and embracing property at risk considerably over one million pounds sterling in value—has awakened the subscribers to the knowledge of the fact that the fire-extinguishing arrangements of the city are totally inadequate to cope with a conflagration occurring amongst the large warehouses in the central and more crowded districts, where the greatest values are deposited. The actual loss by the fire, irrespective altogether of loss and derangement of business, &c., may be estimated as little short of 150,000*l.*; and but for the valuable aid rendered by the employes of the surrounding warehouses and others, and the fortunate fact that the wind was not high when the fire broke out, it is believed that the destruction of property would in all probability have been ten

times greater. It is admitted that the fire brigade acted with great courage and determination; but we submit that the degree of protection provided for the ratepayers is quite insufficient and unworthy the city of Glasgow. In the first place, the water supply was very deficient on the occasion. We are informed that the pressure of water during the night (when fires are most frequent) is greatly reduced. If this be so, it is absolutely necessary that this arrangement should be altered, and made such as to secure an abundant supply of water under full pressure immediately on the occurrence of a fire. In the second place, a large addition to the strength of the brigade and to the number of steam fire-engines and other appliances is necessary; and when it is mentioned that the neighbouring burgh of Govan, with one-tenth of the population of Glasgow, possesses one steam fire-engine and a staff of fifteen men; and Partick, with a smaller relative population, one steam fire-engine and a staff of eleven men, surely Glasgow, with its half-million inhabitants, is sadly behind in possessing only three steam fire-engines. The three steamers—and, we understand, practically the whole force of the brigade—attended the fire, so that had another serious fire broken out in any other part of the city the brigade would have been powerless to give efficient service.

We consider it unnecessary to enlarge further on this important subject as the early hour in the evening on which the accident occurred gave a large number of the most influential citizens and officials the opportunity of seeing for themselves the magnitude of the danger to which the city is exposed from the existing weakness as regards numbers and appliances of the fire brigade. These weaknesses call for redress, and we, as very large payers of rates, trust that the necessary measures will at once be taken for securing the more effective limitation of large fires when they unfortunately occur. In addition to the heavy municipal rates paid by us, our insurance premiums are very onerous; and it is not unlikely that, with experience of November 3, if matters are not much improved as regards fire extinction arrangements, we shall be shortly face to face with still higher insurance rates, and probably also, in the case of some of us who have exceptionally large insurances to effect, with inability to get covered for our full values, as insurance offices may, in all probability, largely reduce the protection they presently give on warehouse blocks. We recommend the whole matter to your careful consideration and early attention.

One of the causes assigned for fires in Glasgow is the overheating of flues, when the ends of lintels or joists take fire. On this subject a correspondent of the *Herald* writes:—Were these buildings erected during the recent building mania in the city, when tenements rose like mushrooms, and no person was appointed to see that the work was properly executed? The flue of a chimney should be so constructed that, no matter how overheated, it should not endanger the building. But are there not brick gables in the city with ten or twenty chimneys in them only 18 inches thick, riddled with flues like a honeycomb? Each flue will be 9 inches square, and a 4½-inch brick is all that can be between the strapping and the flame if the flue is on fire; and suppose this flue not particularly built, but with joints open, can anyone not see that in nine cases out of ten fire may be the result? Or again, suppose the flue carefully built of common red brick, and the wall straps secured with iron holdfasts, and the gable receive a coat of plaster at the back of the straps on the brick; if often on fire the brick will be damaged, and a similar result may be anticipated. But what if wood dooks are driven into the joints of the brick to secure the straps, and no coat of plaster? I maintain that no vents should be formed in any wall of brick unless such wall is at least 27 inches thick, and either have fire-brick or fire-clay linings, and no stone gables should be built less than 30 inches thick, and all flues have fire-clay linings. The linings are indispensable in the case of stone walls with flues, because in the majority of quarries the stone produced does not stand fire. Again, such a thing as "back smoke" is often talked about. Without entering in detail on this matter, I would simply say to those who may be annoyed, let them test their flues by stopping them up at the top, and kindle anything in the chimney that will make smoke. If such comes out about the floor or skirting of the rooms above, their flues are at fault and in danger of fire, and should at once be rectified. Were all buildings to have fire-cocks on each stair landing, with hose long enough to reach any part thereof, and the necessary care in construction and erection duly attended to, and those that are found deficient rectified, I think that would be true political economy, instead of paying large sums to insurance companies. Buildings, no matter how extensive, if properly designed and erected with ordinary care, will not have much fire risk. It is only trifling with facts to blame timber linings when the sore is no doubt often in the thin but false economic walls, with smoke flues behind the linings and wall straps. I cannot believe in the economy of thin walls for flues with great fire risk. If vents be required in walls which otherwise can be 20 inches or 2 feet, let these be buttressed to 2 feet 6 inches.

**The Wolverhampton School Board** have agreed to instruct an architect to prepare plans for the erection of offices in Stafford Street, at a cost not exceeding 3,000*l*.

## ARTISANS' DWELLINGS.

THE Metropolitan Board of Works have issued a statement connected with the carrying out of schemes under the Artisans' Dwellings Acts. According to it, forty-one official representations have been under consideration; fourteen schemes have been or are being carried out, having a total area of 41½ acres. They involved the removal of about 21,000 persons living in 8,988 rooms. The cost to the ratepayers, after deducting the amount received for land sold and the value of that not yet sold, has up to the end of September 1883 been 1,247,956*l*. Dwellings have been erected on some of the areas, giving accommodation for 12,008 persons, others are in course of erection, and land is vacant, but not yet disposed of, upon which others may be built to accommodate about 14,300 more, making in all 26,300 persons provided for. The cost has been at the rate of 29,890*l*. per acre; or the cost of the land on which 26,300 will be housed is at the rate of 240*l*. for every family of five persons. Only four sites of those already available for disposal remain unsold—namely, three in Essex Road, Islington, and one in Goulston Street, Whitechapel. These were offered for sale by public auction on June 1, 1883, since which time negotiations have taken place for disposing of them by private treaty. They are to be again put up to auction early in 1884. Four other schemes were confirmed in July 1883, and are now being dealt with. These comprise 1,176 rooms, occupied by 2,683 persons. Some of the schemes submitted have been dealt with in other ways; one was rejected by the Home Secretary, and others were considered to be too small. The large amount specified as the net burden falling on the ratepayers will be further enlarged by the four schemes mentioned as having been confirmed in July last.

A table shows that the estimated cost of carrying out these four additional schemes is 86,480*l*., thus raising the total deficit to 1,334,436*l*. Irrespective of these four undertakings, there is a total of 151,193*l*., consisting of "approximate amounts paid for trades," a sum equal to rather more than 12 per cent. on the actual net cost of the schemes. Among the trades thus compensated there are those of 36 public-houses, besides 468 of other kinds. The largest amount of trade compensation occurs in 1877, in connection with the locality specified as Goulston Street and Flower and Dean Street. Here the approximate amount so paid was 45,340*l*. in respect to 134 "trades" and 9 public-houses. Next in magnitude of compensation is the Whitecross Street scheme, where the compensation was 34,770*l*. for 80 "trades" and 6 public-houses. This scheme figures as the most costly, the net expenditure being no less than 300,625*l*. The number of persons provided for in the new buildings at this spot is 5,100, the net cost being, therefore, at the rate of 290*l*. for each family of five. The number of persons displaced was 3,687, occupying 1,542 rooms, and the average rental per room per week was 2*s*. 6*d*. In King Street, St. George the Martyr, Southwark, the average rental per room was 1*s*. 10*d*. per week. In Wells Street the rental was still lower, being only a fraction more than 18*d*. per room. Here the number of persons displaced was over a thousand, and the same number will be accommodated, the actual net cost being 71,000*l*. The highest average rental per room was 3*s*. 2*d*. per week, appertaining to Bedfordbury and Great Wild Street. The Goulston Street and Flower and Dean Street site comes next to Whitecross Street for the extent of the net cost, the amount being 263,560*l*.; and, inasmuch as only 3,260 persons are to be provided for, the cost per family of five will exceed 400*l*. The persons displaced are 3,247, and the average rent they have been paying is 2*s*. 9*d*. per room weekly, the number of rooms being 1,381.

## ORGANISMS IN BUILDING MATERIALS.

A LETTER appears in the *American Architect* from Professor Fairfield upon Microscopic Organisms in Building Materials. In the course of it he says:—The decomposition vibrio is constantly present in the pores of bricks used in the construction of cesspools, interpenetrating the whole structure; and in large cities the moisture of the soil carries thousands in every drop. It exists by millions in every saturated splinter of the timber of decaying wood-pavements, and is frequent in the damp under-surface of paving stones. Let me give you a curious experiment, by way of showing the constancy in nature, not of the decomposition vibrio only, but of other organisms of decay. Arrange your instrument for examination; then construct a cell-slide capable of containing one minim of water, by cementing a glass circle or ring of the proper thickness to the surface of an ordinary slide. This done, cut the thinnest possible shaving from the interior of a block of perfectly dry white-pine or other timber; transfer the section to the cell, add a drop of water which has undergone the process of sterilising; cover with a common circle of glass carefully cleaned, hermetically seal the preparation, and place it under the lens. From the instant of cutting the shaving until the first clear observation is obtained, the interval occupied need not exceed ten seconds; but short as this interval is, the field is already alive with monads, the contact of the dry and apparently dead timber with moisture

having instantaneously reawakened millions of slumbering particles of living matter, which might have slept for years, possibly for centuries, had the timber been kept perfectly dry. A section of a dead leaf forms an equally interesting object for experiment; but if you put away the slide and wait for the secondary and tertiary development, the resulting organisms will not be vibrios, as in animal decomposition, but curious ovoid discs very sluggish in movement—a turtle-shaped organism with sixteen long, flexible tenacles at each end, and a bacteroid organism with dark lines of longitudinal striation, having twenty tentacles at each extremity. Forest mould after a summer rain swarms with these three microscopic forms of life; showing how nature in her wonderful laboratory is for ever engaged in economising her vital resources, and from the decomposition of the larger visible forms wrings an equivalent in microscopic organisms for each imprisoned particle of living matter; for to the experienced microscopist, whose optical analysis has penetrated deep into the processes of nature, there is no such thing as death, in the sense of the extinction of vital activities, in that mysterious basis of tissue forms, the so-called protoplasm, or living plasma from which brain and bone, muscle and membrane of our larger life are evolved; and the body that lies so silent in its coffin, though its functional activities have ceased, still lives in myriads of microscopic lives—those universally present organisms of decay described by your correspondent, hiding themselves in the pores of brick and stone, penetrating wherever moisture can penetrate. Lying ill on one occasion, several years ago, in a room on the second storey of a brown stone mansion in Twenty-eighth Street, during the winter, I became curiously interested in the drops of moisture oozing from the wall, and running down in tiny rivulets. My first work on getting so as to sit up in bed was to rig my microscope and make a study of this ooze, which proved to be loaded with vibrios of decomposition that had migrated through the brick walls, thus showing how essential to good sanitary construction it is that ample air and ventilating spaces should be left in the most solid and apparently impermeable structures.

### A NEW YORK PALACE.

THE new residence in Madison Avenue, New York, which is being erected for Mr. Henry Villard, the railway speculator, is nearly complete. This colossal structure occupies an entire block, having a frontage on Madison Avenue of 200 feet. The part which will be occupied is at the corner of Fifty-first Street. Its frontage is 60 feet, and its depth 100 feet. The other wing will be perfectly similar, except that it is divided into three houses; and between the two houses is a court 80 feet in width and 73 feet in depth. That portion of the building at back of the court extends back 40 feet beyond the wings, and is a double house of itself. In the centre of the court will be placed a magnificent fountain, around which will be a broad drive, and in each corner a grass plot. Each house will communicate directly with the court. Mr. Villard's house and two other houses are completed, excepting the interior, while the walls of the remaining wing are up to the second story. The exterior of the great building is more grand than beautiful. It is the result of a combination of Roman and Florentine architecture, plans of the Cancellaria Palace at Rome and the Farnese Palace being copied by the architects. The material is Belleville sandstone, the light grayish amber stone of which Trinity Church was built. Everything is massive, and there is little attempt at ornament. Huge blocks of stone are piled upon one another and overtopped by a heavy cornice of the same material. The wings are three stories in height, besides the basement and attic stories. From the sidewalk to the top of the cornice the measurement is 68 feet. The basement and first story are rusticated, and the others plain stone ashlar, with the angles strengthened by rustication. The front of the two centre houses is supported by five arcades, with heavy columns of Jonesboro granite. Dutch tiles cover the roof. The whole effect is severe and dignified. There is a magnificent reception room 14 feet by 28 feet in depth. Everything here is in inlaid wood, floor, ceiling, walls, and columns. On either side open the drawing-rooms. They are each 19 feet by 28 feet, and are being finished in mahogany, inlaid with light woods, satin wood and maple being noticeable. Between the pilasters will be hung rich embroidered stuffs. The predominating tones are a light reddish brown and a light yellow. The drawing-rooms and reception-room are so arranged that they can be thrown into one spacious apartment 100 feet in width and 28 feet in depth. From the reception-room a hall 14 feet in width and 42 feet in length leads to the music-room. Aladdin's lamp never revealed a hall more magnificent. It is entirely in mosaic. The material is yellow Italian marble. The floor is in Chaillon marble in small pieces, woven into beautiful designs. The mantel is a masterpiece of the sculptor from an Italian design, and the whole apartment was executed by Italian artists in the style of modern Pompeian palaces. The hall is spanned by three semi-circular arches in Sienna marble, with sculpture by Louis St. Gaudiens. A vestibule in the same design leads out of the hall, back of the drawing-room. The music-room is the *chef d'œuvre* of the decorator's art. It is a diminutive

theatre 48 feet by 24 feet in dimensions, and 32 feet from the floor to ceiling, extending to the third story. It is in the style of the Francis I. room of Fontainebleau Palace. The colours are white and gold. A wainscoting 8 feet in height in carved pine surrounds the room. At one end is a gallery for the musicians. The ceiling is an elliptical vault, and every detail shows the skill of the artist. Between the music-room and the vestibule, marble stairs 12 feet broad lead to the upper stories. Again the tone is yellow. An elaborate Renaissance ceiling spans the stairs. The elevated way occupies the remaining space. Across the hall are the main breakfast-room and dining-room, which can be thrown into one apartment 20 feet by 60 feet in size. Carved woods again replace the marble. The room is executed in English oak, inlaid with white mahogany. The ceiling is divided with beams cased with English oak, and the carved friezes, 3 feet in width, are inlaid with floral designs. The two mantels are of red Verona marble, and are copies of those which Mr. Mead was sent to Italy to select, but which arrived in a somewhat damaged condition, and were presented by him to the Museum of Art. Here also M. St. Gaudiens' skill is seen. The upper stories are in keeping with the splendour below, although, of course, not so elaborate. The general style is Italian Renaissance. The furniture will be especially magnificent. That of the drawing-room will be upholstered and of colours harmonising with the decorations, the reddish brown tone predominating. It was designed by the architects who executed the rooms. The other houses will be furnished in a style becoming their pretensions, although nothing like this. The cost of the building unfurnished will be about a million dollars. Of this sum the decorating of the drawing-rooms cost 50,000 dols.; the dining-rooms, 20,000 dols.; the hall, 30,000 dols.; and the music-room, 20,000 dols. As much more will be expended on other work in the latter room a year hence. To finish the interior of Mr. Villard's house necessitates the expenditure of 250,000 dols. The upper floors are now about completed, and the furniture is arriving. The structure, when completed, will be the most magnificent residence, building in the States, far surpassing the Vanderbilt houses. It is the first attempt made to reproduce an Italian palace in America.

### The Ventilation of the New Law Courts.

SIR,—In your journal of last week there is a commendatory article on the ventilation of these courts. There are a great many officials whose duties, like Mr. G. G. Kennedy's, compel them to be in daily attendance, who would, if opportunity offered, be willing to testify to the same effect. A few facts, therefore, bearing upon the matter, will help those who possess any knowledge of the subject to understand the real state of the case.

Taking the whole of the last term into account, which commenced on November 2, the ventilation was in charge of the writer, whose duty it was to see that the atmosphere of each court was kept in a state, and at a temperature, agreeable to the presiding judge. No complaints came from any of the courts during this time, with the exception of No. 3 Queen's Bench, where cold draughts were complained of. These, however, were found to be almost wholly due to structural defects in the ceiling and draughts from the jury doors, which no doubt caused some inconvenience, but these were not at any time sufficient to affect the thermometer, which recorded temperatures of remarkable steadiness, at no time showing below 62 deg. F.

With regard to the statement that cold and hot blasts of air alternate, it will be sufficient to state that at no time during the last term was the temperature of the inflowing fresh air below 66 deg. F. The actual range, taking the courts all round, was from 66 deg. to 74 deg. F.; nor is it possible to send absolutely cold air into the courts in the winter season; this danger was especially guarded against in laying down the scheme. The average temperature, taking the whole of the courts into account, was 63 deg. F., none of them being below 60 deg. No condensation was seen at any time on walls or windows—not in the most crowded courts. The average rate of interchange or renewal of the air was three times in the hour.

When the existence of the structural defects named above was made known, the authorities promptly took the matter up, and workmen are now engaged making the roofs air-tight, which, when completed, will put these courts in a condition, as regards ventilation, as perfect as those are that have sound roofs. It should, however, be borne in mind that the Houses of Parliament were not satisfactorily ventilated to begin with; it took a great deal of thought and time to get it into this state, so a little patience should be exercised, seeing that difficulties have to be surmounted far greater than could possibly be experienced in dealing with the two Chambers of Parliament.

Your obedient servant,  
Room 551, Royal Courts of Justice: FREDERICK BLAKE.  
January 9, 1884.

**Construction of Silos.**

SIR,—I want to construct a "silo" in a gravel pit 18 feet by 12 feet by 10 feet deep, holding 3 to 4 feet of water in it. Will anyone having experience in such matters kindly advise me if the following plan will succeed?

I propose pumping out the water and building a concrete floor 1 foot thick and concrete walls 1 foot thick, just high enough to flood the whole, until the concrete is sufficiently strong to resist the lifting strain of the water. When this is effected, which I suppose will take about two months, to again pump out the water, raise the walls the necessary height in brickwork, and cement the whole. My doubts are as to the setting energy of Portland concrete under water, its porosity, and also whether the cement may be relied on to keep out damp. Any suggestions will greatly oblige,

Your obedient Servant,

B.

**Builders' Grievances.**

SIR,—Mr. Stanley Bird's very able communication to you will, I think, commend itself to all interested—as he is so notoriously—in honest building. As he justly says, it is the jerry builder who is responsible for the present depression, and who is alike the enemy to the trade and the public.

I write, however, to suggest that if the idea of examining and giving a diploma of fitness to the *builder* sounds a little utopian and impracticable, there would be nothing impracticable in applying the same process to the *building*. Why, in fact, should not buildings be dealt with as are ships, and be surveyed and classified by some building "Lloyd's"? If it is necessary that the ship should be certified as to fitness by some central responsible body, why is it not as necessary for the house we live in? It may be that the classification would be optional on the part of the owner, but here at once would arise the distinction between the good and the bad house, for it would answer the purpose of every man building a good house to pay the fees to enable him to place with his deeds a "Building Lloyd's" certificate that his house is classed A 1 or otherwise in all respects, constructional, sanitary, &c.

Mr. Bird tells us that a meeting of representatives of the Royal Institute of British Architects and the National Association of Master Builders is shortly to take place. If any real and lasting result is to come of such a meeting, I venture to suggest that class interest on either side must be dropped, and measures which will promote the public interest must be alone discussed.

I have very imperfectly suggested one measure of public interest, and in connection with it I would name another. I refer to the much vexed question of the "arbitration clause." As a builder of twenty years' standing I have had the misfortune to meet with unscrupulous architects and employers, in which case an arbitration clause is a most valuable protection. On the other hand, no one can be brought much in contact with the honourable profession of the architect without learning that there is another side to the question. Contractors are not all Stanley Birds, and an arbitration clause in the hands of a scheming unscrupulous builder may involve the innocent employer in the most expensive form of litigation known. As a builder, therefore, I admit that the employer requires as much protection and consideration as does the builder. But he requires and is entitled to no more.

I submit that if some tribunal were constituted, having the architectural and building interests alike represented (some "Building Lloyd's" without its insurance element), the question of arbitration might be met upon a more equitable basis than at present, and without the hard and fast lines now insisted upon on either side.

Your obedient Servant,

Southampton: January 9, 1884.

H. I. SANDERS.

**The New York Produce Exchange.**

SIR,—In your issue of December 29, 1883, we find a paragraph in reference to the new Produce Exchange building in New York. In addition to the interesting facts stated, and as indicating the admirable provision made for the comfort of the members, it might be further mentioned that the building will be provided with no less than nine powerful and rapid Standard Hydraulic lifts, the contract for which was awarded to our New York house, Messrs. Otis, Brothers & Co.

Yours faithfully,

AMERICAN ELEVATOR COMPANY.

38 Old Jewry, London: January 3, 1884.

**Exhibition Buildings.**

SIR,—The interesting article by Professor Roger Smith in *The Architect* of the 5th inst. refers to the want of tact which was displayed by the late Sir Henry Cole when he inaugurated the annual technical exhibitions at South Kensington, which were doomed to be a failure. I always understood that the arrangement by which the galleries were kept closed on the sides abutting upon the gardens was mainly inspired by the selfishness of the authorities of the Horticultural Society, who at that time felt secure in their

possession of the public land. They were afterwards undeceived. But what I now wish to note is that the principle which should control an exhibition building, if it is to be successful, was well known to all who took part in the arrangement of international exhibitions. I possess Sir Digby Wyatt's own copy of his report on buildings of that class, *apropos* of the Vienna Exhibition, and it shows plainly enough that the necessity of arrangements by which visitors could congregate in one place was an acknowledged fact. In Vienna there was the great circular space, 354 feet in diameter, from which all the courts branched, and this was but the outcome, by a process of evolution, of the halls which existed in several of the earlier buildings.

In the Great Exhibition building of 1851 there was the immense nave. In the New York Exhibition building which came next (for the Cork building was not of much importance), there was a central space surmounted by a dome, which, although only 103 feet in diameter, was an anticipation of what was accomplished twenty years afterwards in Vienna. The principal feature in the Dublin Exhibition of 1853 was a splendid hall 425 feet long, 100 feet broad, and 105 feet high, which was used as a promenade, and, according to Sir Digby Wyatt, "its attractions mainly saved the undertaking from financial failure." The Paris Exhibition of 1855 was held in buildings which had been planned and commenced by a private company, and, as they were only adaptations, it is not surprising there were shortcomings in them. The Paris Exhibition of 1867 was on a rigorous scientific plan, in which the divisions were arranged according to the materials employed in the various industries. There was little need of a great hall, as visitors were able to congregate in the grounds. The exceptions prove the rule, and experience has demonstrated that the Commissioners of 1851 were endowed with foresight when they laid it down, among other rules, that in an exhibition building there should be "grand points of view" which were to be preserved under all circumstances, and that the main avenues should be so designed as to allow immense numbers of people to be accommodated on ceremonial occasions. In fact the design, which was prepared by the Building Committee, comprised a central rotunda 200 feet in diameter, which at that time was considered to be a very bold undertaking, and the area was enough to allow of a large assemblage.

Before the scheme of the Exhibition of 1851 was organised Digby Wyatt was sent over to Paris to observe the preliminary arrangements of the Exposition in the Champs-Élysées, and his companion on that occasion was Henry Cole. They were both amazed at the want of method and the bad planning. One defect was said to be the total impossibility of converting a part into a vast hall in which a multitude could assemble. The effect of a possible *ensemble* was entirely lost, and the impression of grandeur and unity on entering was sacrificed to a fancied regularity of plan. It is difficult to understand how Henry Cole could have felt the importance of some great nave or hall in 1849, and long afterwards had adopted a series of almost endless galleries as the best type of an exhibition building. In this case, as in many others, he was, I fancy, made responsible for the notions of other people; and what Professor Smith calls an unpardonable blunder is to be ascribed to the spirit of the council of the Horticultural Society rather than to Sir Henry Cole.

It may be noted here that Sir Digby Wyatt's ideal of an exhibition would somewhat resemble one of the great railway termini, in having no internal walls, the roof being supported by light, cheap columns, with the light coming vertically down from near the apex. In a building of this class the arrangement would be almost evident at a glance, which was not the case in the Fisheries galleries. I know a great many people who visited South Kensington last summer, and wandered here and there without seeing more than a part of the exhibits; and, although the "*al fresco* lounge," to which every one drifted sooner or later, was very attractive, it was hardly complimentary to the exhibitors to find that they could not compete with a military band.

Yours faithfully,

B. B.

**The House Tax and Artisans' Dwellings.**

SIR,—As you take a deep interest in the better housing of the working classes, will you allow me to bring before you one of the impediments to its accomplishment? It is the incidence of the House Tax; for when a private individual builds blocks of dwellings, where several families are housed in flats under one roof, although each tenant's rent is considerably under 20*l.* per annum, and he is separately rated to the poor, the House Tax is levied, and thereby his rent is increased by about 2*d.* per week. In 1866 the Chancellor of the Exchequer rendered free of this tax all dwellings owned by the Peabody Trustees and other associations of that character, but he refuses to extend this privilege to any dwelling owned by private individuals. As this is so manifestly unjust to the tenants of the latter class, I trust that you will assist in making this fact known generally, and endeavour to procure an alteration of the law in the next session of Parliament.

Yours faithfully,

W. S. HORNER.

Aldgate: January 7, 1884.

## NOTES ON NOVELTIES.

**Silicated Carbon Patent Movable Block Filter.**—The accompanying cuts will explain the construction of the latest improvement introduced by the Silicated Carbon Filter Company in their filters. By means of a diaphragm inside a filter carrying a strut, an earthenware spindle is made to pass through the centre of a block of silicated carbon, which is then bolted down by a nut to a hollow flange of indiarubber. The removal of the nut releases the block, which can thus be instantly taken out for cleansing or removal, leaving the whole of the interior of the filter open for inspection. The working parts are all stoneware, and no corrosion is possible. The block itself being non-porous on the top and edges, an upward direction is given to the water, which thus passes through a greater

thickness of the silicated carbon, as shown by the arrows in section. Extra blocks can be supplied with a filter when desired, while all parts being interchangeable can be replaced in case of accident without the filter itself being returned to the makers. The patent movable block can be adapted to all patterns manufactured by the Silicated Carbon Filter Company without increased charge, and filters of other makes can be refitted on this principle when desired. The patent movable block filter has been designed to meet a growing demand for a filter of which every part is accessible for cleansing, and in which the filtering medium can be renewed by the user himself as often as required without returning it to the makers.

## ENGINEERING WORKS.

**Blackfriars Railway Bridge.**—On Saturday, the 5th inst., the foundation stone of the new railway bridge at Blackfriars was laid. The bridge, which runs parallel to the existing structure, and is a few feet to the east of it, consists of five bars supported on four piers of masonry and concrete, the foundations of each pier being two iron caissons (30 feet by 32 feet), which are coupled by an arch of masonry. These are loaded and sunk to a depth of 20 feet below the bed of the river. They are then pumped dry of water and filled with masonry and concrete. The bed of the river consists of ballast to the depth of some 5 feet. Next is London clay, which is of so hard a character as to render the use of the pick necessary for excavation. In this material the caissons are firmly imbedded. It is not generally known that this particular part of the river is one not favourable to bridge building, in consequence of the shallowness of the water on either side and the strength of the current in the centre. This necessitates great care being taken in the erection of the timber staging and all other work of a temporary nature. At the present moment there are a large number of workmen, concreters, timbermen, bricklayers, &c., busy day and night, and the works are being pushed forward with much energy. Mr. Wolfe Barry and Mr. Brunel, who act in conjunction with Mr. W. Mills, the engineer of the railway company, are the designers of the bridge, and the work is being executed by Messrs. Lucas & Aird, whose agent, Mr. H. Turner, personally superintends it. Mr. Crutwell is the resident engineer. The new City station of the London, Chatham, and Dover Railway, to which the new bridge will give direct access, will be shortly taken in hand. This will be a spacious building extending back to the river, the platforms, of which there are to be five, running some little distance on the new bridge. The booking-offices, waiting, refreshment and other rooms, will be larger than usual, owing to the amount of ground at the company's disposal, while it is intended to keep the arrival and departure platforms distinct, with the view of avoiding the confusion such as, for instance, exists at Ludgate Hill. It is likewise intended to throw some girders across Queen Victoria

Street, so as to afford trains in the new station a direct communication with the Great Northern and Midland Companies' lines. There will be covered ways from the District railway station at Blackfriars and Ludgate Hill, in order that the three stations may be in direct communication. Mr. W. Barry is the architect for the station. The estimated cost of the works for the bridge and station is 300,000/.

**The Hull and Barnsley Railway.**—The works upon the first section of this line from Hull to Cudworth have now made such progress that Messrs. Lucas and Aird, the contractors, are confident that they will have the section to Howden completed by May, while the remainder of the line and the docks will be finished by the end of the year. The directors have therefore determined, in order that no time may be lost in getting the whole system in working order, to commence the Halifax and Huddersfield extension, and the other authorised works by which a connection will be secured with the London and North-Western Railway, so that the company's line will then form part of a through route between Liverpool, Manchester, and Hull. The proposed extension commences near the Cudworth station, on the Midland Railway, by junctions with that line and the Hull and Barnsley original undertaking, now nearly completed; and it proceeds west, through the Flockton coal-field, to Huddersfield, and thence by direct route to Halifax, a total distance of about thirty miles.

**Hove Improvements.**—The Hove Commissioners have held a special meeting to consider two reports, one recommending the sealing of a contract with Messrs. W. Hill and Co., for the construction of a sea wall, with inclined and timber groynes, for the protection of the foreshore, for a sum of 23,946/., and the other recommending the Board to give general support to the London, Reigate, and Brighton Railway scheme, better known as the "Direct Railway." The first was met with an amendment to the effect that a less expensive scheme would be equally efficacious in protecting the sea front. This was negatived. The proposals relative to the railway also received opposition, an amendment being moved declaring that the introduction of the new line would be detrimental to the interests of Hove as a residential town. This was also on a division negatived, and the reports were adopted.

**The Mersey Tunnel.**—The boring of the heading of the tunnel is now practically an accomplished fact, less than 120 yards only remaining to be pierced, so that by the third week in the new year the subaqueous communication between Liverpool and Birkenhead will be effected. Further, by Christmas next the railway will be ready for traffic, and trains will be running between the city and borough. The operations have been carried out under the personal superintendence of the engineers, Messrs. Brunlees and Fox, by Mr. John Waddell, of Edinburgh, the whole being under the control of Major Isaac. Meanwhile, the directors are considering the position and importance of the scheme as affecting the converging railways in the district, with the ultimate purpose of promoting the interests of the shareholders in every possible way. The advantages of the tunnel for other purposes than railway traffic cannot be estimated too highly. At present the telegraph lines connecting Liverpool with Birkenhead run *via* Runcorn, while there is no intercourse by telephone. With the completion of the drainage heading, these inconveniences and wants will be remedied; the cables or wires will run direct under the Mersey, and bring either bank into immediate connection with the other. Possibly the heading might be utilised by the authorities for introducing the new water supply from the Vyrnwy Reservoir, North Wales, carrying the pipes or mains through to Liverpool, and in several ways the tunnel scheme will be conducive to the prosperity and convenience of the district. The mineral and goods traffic will be greatly accelerated by the opening of the Mersey Railway.

**The New Niagara Bridge.**—Niagara River is at length spanned in full view of the mighty cataract by the Michigan Central's cantilever bridge. On April 12 last a contract was entered into. The excavations for the foundations were begun April 15. The pits for the piers were finished, and the introduction of the beton cement begun June 6. The foundations were completed June 20 on the American side and seven days later on the Canada side. The first stone for the piers on the American side was laid June 25, and on the Canada side July 13. The American piers were capped August 20, and the Canadian September 3. On August 29 the first column of steel for the tower was lowered on the American side, and on the Canada side September 10. The last section of the American tower had been laid two days previous, and on the Canadian tower it was put down September 18. On the 24th the first iron for the cantilever was run out, and both cantilevers were soon completed. On the earliest opportunity a heavy beam of timber was thrown across, and the Canadian and American gangs of builders were able to clasp hands. One of them, Jack McCoy, found the temptation to be the first man to cross on the beam too strong for resistance, and over he went on a keen jump, in violation of the orders of his foreman. His eagerness to be the "first man" therefore secured for him what the workmen designate a "red ticket." In other words, he received immediate dismissal from the service of the contractors. The work of putting in the fixed span

began in the morning early, and when the hour of noon arrived the sections had been connected and the bridge practically completed. The principle of the cantilever plan is that of a trussed beam, supported at or near its centre, with the arms extending each way, and one end anchored or counter-weighted to provide for unequal loading. In practice it is entirely new, this being the only bridge completed upon the principle. The Firth of Forth bridge in Scotland, with a clear span of 1,000 feet, is being built upon this plan, and the Fraser River bridge, 315 feet clear span, on the Canadian Pacific. These are the only examples of this design yet undertaken. The total weight of the iron and steel entering into the composition of the massive structure is 3,000 tons. The bridge is of sufficient width for a double track, and is built to carry upon each track at the same time a freight train of the heaviest kind extending the entire length of the bridge, headed by two "consolidation" engines, and a side pressure of thirty pounds per square foot, which pressure is produced by a wind having a velocity of seventy-five miles per hour. Under these loads the structure is strained to only one-fifth of its ultimate strength. The total length of the bridge proper is 900 feet and 9 inches, divided into two cantilevers of 895 feet on the Canadian side, and 395 feet on the American side, supported on steel towers arising from the water's edge. A fixed span of 119 feet and 9 inches is suspended from and connects the river arms of the cantilevers. The clear span across the river is 494 feet and 9 inches, being the longest double-track truss span ever yet built. The bridge spans a chasm of 859 feet from bluff to bluff. The total weight resting on each of the towers under a maximum condition of strain is in round numbers 3,200 tons. The total uplifting force that can be exerted on each of the shore arms of the cantilever is 340 tons, and the weight of each shore anchorage is 800 tons. It will be seen that every single piece of material is five times as strong as it actually need be, so that the bridge can be strained to only one-fifth of its ultimate strength.

### ART WORKMANSHIP.

**Stained Glass.**—Two painted windows have been inserted in the church of Hoo, St. Werburgh, near Rochester. One window is in the east end of the north aisle, and is to the memory of the late Mr. Aveling, of Rochester. It has three lights with tracery of the fourteenth century. These are filled by three figures—David, Solomon, and Hezekiah; above the figures are decorated canopies, which run through the tracery. The figures are very kindly, and their robes are carefully and accurately represented. The second window is at the west end of the same aisle, and is to the memory of the late Mr. Aveling's mother. This window has two lights; the subjects in them are acts of mercy—*Hungry, and ye fed Me, Naked, and ye clothed Me*. The drawing, colouring, and grouping of the figures are artistic. The two windows were executed by Messrs. Heaton, Butler & Bayne.

### NEW BUILDINGS.

**Cardiff.**—Extensive alterations and additions are now being contemplated to flour mill premises, Canton, Cardiff, lately belonging to Mr. Longher, and recently destroyed by fire. It is proposed to reconstruct the building and adapt it for the purposes of a large factory for Messrs. John Marsh & Co. Mr. S. Rooney, of Crockherbtown, Cardiff, has been entrusted with the plans and supervision.

**Mold.**—A new rectory house is to be erected at Halkyn, near Mold, by the Duke of Westminster, who a few years ago erected the marble church in that parish, which is one of the most handsome churches in the diocese of St. Asaph.

**Saltburn.**—Sanitary and other alterations are being carried out at Upleatham Hall, Lord Zetland's marine residence, near Saltburn, under the direction of Messrs. Clark & Moscrop, architects, of Darlington.

**New Arcade, Birmingham.**—The Imperial Arcade is shortly to be opened in Dale End by Mr. Thomas Hall. The arcade, which adjoins St. Peter's church, has a frontage of about 68 feet, and a total depth of 135 feet. The front is of Darley Dale and Bath Stone, and is Renaissance in style. There are four shops facing into Dale End, two on either side of the principal entrance, and above them suites of rooms four storeys in height, intended to be let as offices or for kindred purposes. On the side next St. Peter's church there is a spacious arched entrance and staircase, giving access to the basement, which consists of one large room, 135 feet long, 55 feet wide, and 14 feet 6 inches high. There is an hydraulic lift connecting this room with the ground floor. The arcade is entered from Dale End through a vestibule 13 feet wide, closed at night by wrought-iron gates, and having plate-glass windows on each side, lighting partially two of the front shops. There is a passage 15 feet wide between the shop fronts on the ground floor, and the width increases to 23 feet 6 inches at the height of a gallery which has been carried

round the arcade in order to form a second floor. Each of the shops on this floor has a store-room over it. The arcade terminates in a kind of rotunda, which has a diameter of 21 feet on the ground floor and 30 feet at the level of the gallery. The roof is supported by semicircular moulded ribs, and is covered with embossed plate glass, and has a large dome over the rotunda; while domed transepts cover the gallery staircases, which on either side ascend at mid-distance between the two extremities of the arcade. The staircase of the gallery next to St. Peter's church, as well as the staircase leading from the exterior to the basement, is at once lighted and ornamented by large stained-glass windows, with figure subjects; and the walls of the rotunda are broken by stained-glass lights of geometrical pattern. The contractor for the stonework has been Mr. John Garlick, of Salford; while the wrought-iron gates have been executed by Messrs. Brawn, of Clement Street; the gasfittings supplied by Messrs. Hunt & Co., of Camp Hill; the lift by Messrs. Tangye, the stained and other glass by Messrs. Hawkes, of Bromsgrove Street; and the mural decorations by Mr. Robert Mann, of Colmore Row. The works have been carried out from the designs and under the superintendence of Mr. Henry Naden, architect.

### CHURCH BUILDING AND RESTORATION.

**Oldham.**—It is proposed to erect a new church in lieu of the present structure of St. Peter's, Oldham, which is the oldest in the borough. The sittings, 753 in number, are found to be quite inadequate to the requirements of the population of the parish.

**Stretford.**—Plans are in course of preparation by Mr. G. T. Redmayne, architect, of Manchester, for the erection of the proposed new mission church in connection with the parish church, Stretford.

**Folkestone.**—An extensive scheme has been prepared and is under consideration for the further improvement of Christ Church, from the plans of Mr. A. Rowland Barker, consisting of a new chancel, extending 25 feet longer than the present building, and the construction of north and south transepts, with the completion of the tower, at an estimated cost of 3,500*l*.

**Dallinghoo.**—The church of Dallinghoo has been restored and reopened. The work carried out consists of new organ chamber with arch opening into the nave, new east window, new oak seats in nave, with richly carved and panelled ends and fronts. The seats at the east end have been arranged stall-wise for the choir, and those on the south side are of oak, with moulded and carved ends, but on the north side the old pulpit and prayer-desk, &c., of Jacobean work, have been altered and refixed. The paving has been laid with tiles from Godwin's works in Herefordshire. The principal part of the work has been carried out by Mr. Stephenson and Messrs. Fosdike, of Woodbridge, from the designs of Mr. William Bassett Smith, of John Street, Adelphi, W.C.

**Belfast.**—The memorial-stone of a Presbyterian church, in course of erection at Fortwilliam Park, has been laid. The style of the building is Gothic, the materials being selected stone of a light tint, from the Glebe Quarry, for the face of the walls and dressings, together with a sparing use of Dumfries stone for the horizontal mouldings, plinths, &c., also for shafts to doors, windows, pinnacles, and carved panelling. The length of the church is 85 feet by 52 feet wide, exclusive of the tower and octagon turret. The height of wall is 45 feet to the eave and 78 feet to the ridge line. The tower is placed at the south-west angle, and with the spire will rise to a height of 178 feet. It is carried up in four stages to a height of 90 feet to the base of the spire. The buttresses are terminated by massive crocketed pinnacles, having carved finials. From this the spire is carried up with carved crockets on the angles, and lucarnes 25 feet high. At the opposite corner a semi-octagonal turret is placed 72 feet high. The church is seated with open benches, having framed and stop-chamfered backs, moulded capping of walnut, and moulded birch ends. Accommodation is provided for 868 persons. The roof is strongly framed with five queen-post principals, ceiled to the level of the collar-beam, and cut into panels by moulded ribs, intersecting the principals and purlins. The moulded ribs of the principals are brought down and rest on carved stone corbels. A deeply-moulded cornice is carried along both sides of the church. The ventilation is provided for by zinc tubes in the roof, carried up to a large air-pump (Boyle's) placed in the flèche. This flèche is of ornamental design, and rises on the roof to a height of 105 feet above the ground-line. Inlets for fresh air are placed in the side-walls by means of galvanised iron ventilators, with internal regulating ventilators, in addition to those of the windows. The heating will be by hot-water pipes. A fall in the ground on the site of the church has been utilised to provide a lecture-hall, giving accommodation to 500 persons, together with session and other rooms, lavatories, heating-chambers, &c. The work is being executed by Mr. Henry, builder, from the plans and under the superintendence of Mr. Henry Chappell, C.E., architect. Mr. William Malcolm is foreman of the works.

**Lichfield.**—Huits Church, a newly-erected structure, has been opened. The building comprises nave and chancel, with south porch and vestry. The style is Early English, and the building is lighted throughout by tall lancet windows, many of which are filled with stained glass. The church is built of Yorkshire stone, with red stone dressings from Alton quarries. Mr. Horsman, of Wolverhampton, was the contractor, who carried out the work from the designs of Mr. John Oldrid Scott.

**Marston.**—The parish church has been reopened after restoration. This has included the reparation and renovation of the roofs. During the work remains of old tiles were found, and these have been copied for the chancel flooring. The church is built principally in the late Perpendicular style, the arcades and chancel arch being of transition Norman. The work was carried out by Mr. J. Honour, of Marston, under the superintendence of Mr. H. Drinkwater, architect.

**Finningley.**—It is proposed to restore the church of Finningley, a village in Nottinghamshire, plans for which have been prepared by Mr. Fowler, of Durham. The church consists of a nave of three bays, with a north aisle, a western tower, a south porch, and a chancel with a chapel or aisle on its north side. Little is known of its foundation, but traces of Norman remains are still to be seen in the south doorway and the lower part of the tower. About the year 1300 the small Norman chancel gave way to the present large one, with its high arch opening into the nave, traceried windows, &c. The nave and chancel were covered with high-pitched roofs, which were replaced about the year 1400 by the present ones of great originality and beauty. The chancel roof has arched principals with carved bosses of foliage or figures, and considerable remains of the coloured decoration which originally extended over all. The sun, moon, and stars are apparent as well as foliage and scrollwork. Amongst the carved figures on the bosses are represented a king with sceptre in one hand and sword in the other; an archbishop, holding his archiepiscopal cross in his right and a hammer in his left hand, and therefore probably representing St. Eligius, the patron saint of smiths; a merchant, Janus, &c.

## SCHOOL BUILDINGS.

**Berwick.**—St. Cuthbert's Roman Catholic schools, which have been erected in Walkergate Lane, Berwick, at a cost of about 600*l.*, have been opened. The schools are in the Gothic style of architecture, and will accommodate 250 children. The architect is Mr. W. Gray, jun., Berwick.

## ARCHÆOLOGY.

**The Roman Forum.**—The excavations at the so-called House of the Vestals have been continued. The latest discoveries are another full length statue, or rather more than life-size, but with the head and hands wanting; the *torso* of a third, from the neck to below the waist; the right knee of a fourth; a beautiful bracelet, or small necklace, of alternate rings of gold and uncut amethysts, with clasp complete; four more pedestals of statues of superior Vestals, with inscriptions, and an interesting inscription relating to the *Castra Peregrina*.

## GENERAL.

**Mr. W. P. Burton**, the landscape painter in water-colours, died on December 31 at the residence of his sister, near Aberdeen. Mr. Burton, who at the time of his death was fifty-six years of age, was a constant exhibitor at the Royal Academy and at the Dudley and Grosvenor Galleries, and was recently made a member of the Society of British Artists. He was a nephew of the late Dr. John Hill Burton.

**The Collection of Ancient and Modern Prints** formed by the late Mr. St. John Dent, of Bryanston Square, will be sold by Messrs. Sotheby, Wilkinson & Hodge, early in April. It includes many of the finest examples known of the early Italian masters, besides a brilliant display of German and Dutch prints, and rare English portraits.

**The Exhibition** of the Glasgow Institute of Fine Arts will open on February 5. There will be a private view on the day before.

**The Oldham Exhibition**, which had been open five months, was closed on Saturday evening. During its progress 290,000 persons paid for admission, and the total receipts were 14,000*l.*

**The Royal Cambrian Academy of Art** have applied to the Privy Council for a charter of incorporation.

**Mr. Charles Lever**, of Culcheth Hall, Bowdon, Cheshire, has been awarded a "diploma of honour," for special services rendered by him in connection with the lighting of the council chamber,

lecture theatre, picture gallery, and dining-rooms at the Fisheries Exhibition at South Kensington, by means of his "Lever Arc Lamp."

**The Edinburgh Dean of Guild** has approved of the design for the pedestal of the group *Alexander and Bucephalus*, by Sir John Steele, which is to be erected at the intersection of St. David Street with George Street.

**A Site** for the College of North Wales at Bangor has not yet been secured. A meeting is to be held shortly, when temporary premises will be selected.

**Canford Manor**, the residence of Lord Wimborne, near Wimborne, was on Sunday partially destroyed by fire. Some valuable Worcester china and some fine oil paintings were destroyed, and much damage was done by water. The central part of the building is completely gutted, and several thousand pounds' worth of property has been destroyed.

**A Carved Pulpit**, executed in old oak from Preston-on-Wye church, and designed by Mr. Thomas Nicholson, architect, Hereford, has been placed in Diddlebury parish church.

**Mr. Edis's Cantor Lectures** on "The Building of London Houses" will be delivered at the Society of Arts on February 18, 25, and March 3.

**The Ratepayers of Bury** have been polled on the question of an application to Parliament for further borrowing powers, to the extent of 211,000*l.*, for purposes of borough improvements. A majority of votes was given in favour of the proposal, but so many were invalid that the question has been decided in the negative by 4,022 against 3,837.

**The Mayor of Eastbourne** has laid the keystone of the nearly-completed new sea-wall works at the east end of the town. The extension will provide an unbroken promenade from the Redoubt Forts along the sea front to the slopes of Beachy Head, a distance of three miles. The total cost has been 49,000*l.*; but, as the Corporation have leased the spare ground near the sea-wall for ninety years, the actual cost to the town is only 12,000*l.*

**The Partnership** between Mr. W. Watkins and Mr. W. Scorer, architects, Lincoln, has been dissolved.

**The Milton School Board** have received plans for a new Board school from Mr. Charles Bell, Mr. W. F. Gosling, and Mr. W. Gould.

**The Derby Town Council** on Wednesday resolved to erect a new lunatic asylum on the site of forty-two acres known as the Rowditch Estate. The land is valued at 400*l.* per acre, and the building is estimated to cost 30,000*l.*

**The Electric Lighting** of the House of Commons will be increased by an addition of about 200 lamps, which will bring the number up to 500. The plant will be ready for use for the opening of Parliament on February 5. The system is an amalgamation of the Edison and Swan systems.

**Captain Shaw** has been examining the corrugated iron curtains now compulsorily used in all German theatres. The largest curtain in Germany, that of the Stadt Theatre at Hamburg, is 39 feet in height and 42 feet wide, and it can be lowered with perfect ease and certainty in twenty seconds. According to Captain Shaw the curtain would certainly stop the strongest flames for at least fifteen minutes, and would probably do so for a much longer time.

**An Anvil** for a 12-ton steam hammer has been cast at the Clydesdale Iron Company's works at Holytown, and is the largest casting of this kind yet attempted. Its weight when finished is estimated to be 250 tons, and the operation of casting this immense block occupied 31 hours, during which time a constant stream of fully eight tons of molten iron per hour was kept running into the casting frame, and the whole of the iron was kept in a liquid state for the 31 hours.

**The Clothworkers' Company** have voted a grant of 1,000*l.* towards the scheme for erecting a people's palace in East London in connection with the Beaumont Trust.

**The Engineers' Estimate** for the proposed Manchester Ship Canal has been lodged in the Private Bill Office of the House of Commons. The grand total estimate is 6,904,186*l.* 12*s.* 6*d.*, and is made up as follows:—For the nine connecting lines of railway, 456,172*l.* 1*s.* 4*d.*; for dock works at Manchester and Warrington, 1,121,262*l.* 13*s.*; for canal works, 3,920,171*l.* 11*s.* 7*d.*; for estuary works, 1,390,419*l.*; and for new roads, 16,161*l.* 6*s.* 3*d.*

**A Return** has been furnished by a firm at Bilston, showing the cost of making finished iron during the past forty years:—In 1843, when medium pigs were 50*s.* per ton—about the average of the present day—the cost for producing a ton of rolling iron was—pigs and castings, 2*l.* 18*s.* 4*d.*; wages, 18*s.* 4*d.*; fuel, 8*s.* 2*d.*; stores and fettling, 2*s.*; rent, taxes, and general charges, 3*s.* 11*d.*; total, 4*l.* 10*s.* 5*d.* Against the foregoing figures the cost in the present day is—pigs and castings, 3*l.* 0*s.* 4*d.*; wages, 1*l.* 7*s.* 7*d.*; fuel, 1*l.*; stores, &c., 9*s.* 5*d.*; and rent and general charges, 3*s.* 10*d.*; total, 6*l.* 1*s.* 2*d.*

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 12, 1884.

### APPOINTMENT VACANT.

CHELMSFORD.—Jan. 25.—Applications are required by the Chelmsford Rural Sanitary Authority for the Appointment of a District Surveyor. Salary 250*l.* per annum. Applications are also required for the Appointment of an Assistant Surveyor for the District. Salary 200*l.* per annum. Mr. W. W. Duffield, Clerk to the Rural Sanitary Authority, 96 High Street, Chelmsford.

### COMPETITIONS OPEN.

ABERDEEN.—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10*s.* 6*d.* to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

BLOEMFONTEIN.—Mar. 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250*l.* A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LEICESTER.—March 1.—Designs are invited for a Block of Buildings proposed to be erected on the South Side of New Entrance to the Market Place. Premiums of £25 and £15. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

LONDON.—March 1.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

ST. PANCRAS.—Feb. 1.—Designs are invited for Buildings for Mortuary and Coroner's Court. Mr. T. Eccleston Gibb, Vestry Clerk, Vestry Hall, St. Pancras Road, N.W.

UXBRIDGE.—Jan. 31.—For System of Sewerage and Sewage Disposal. Mr. Charles Woodbridge, Clerk to the Rural Sanitary Authority, Uxbridge.

WALMER.—Jan. 21.—Designs are invited for Laying Out the Estate of St. Clare for Building Purposes. Messrs. W. & T. Denny, Walmer.

### CONTRACTS OPEN.

ABERDEEN.—Jan. 14.—For the various Works, including Ironfounder's, connected with the Erection of Additions to Steam Laundry. Mr. J. Russell Mackenzie, Architect, 91 Union Street, Aberdeen.

ABERDEEN.—Jan. 26.—For Supplying, Erecting, Fixing and Testing Hydraulic Machinery, for the new Dock Gates, Victoria Dock. Mr. Wm. Smith, Harbour Engineer, Aberdeen.

ARDEE.—Jan. 15.—For Sinking of Open Drains or Water Courses on the north and south sides of the River Dee, and the Construction of Tanks and Sewers, with Auxiliary Works. Mr. Thomas B. Dromgoole, Sanitary Officer, Board Room, Ardee Workhouse, Ireland.

ARDROSS.—Jan. 14.—For Construction of Works for Draining the Ardross Back-fields, Elie. Mr. Alexander C. Boothby, C.E., Kirkcaldy.

AVIEMORE.—Jan. 24.—For Construction of Bridge over the River Spey; Masonry, &c., in Abutments and Pier, Wrought-ironwork Superstructure, and Cast-iron Cyllinders in Pier, &c. Mr. W. Roberts, Engineer, Surveyor's Office, Kingussie.

BALLATER.—Jan. 17.—For Construction of Stone Bridge over the River Dee, with Cast-iron Cyllinders, Foundations, Approach Roads, and Works in connection. Messrs. Jenkins & Marr, C.E., 16 Bridge Street, Aberdeen.

BAMFORD.—Jan. 19.—For Fencing Site of proposed Church of St. Michael. Mr. H. C. Charlewood, Architect, 6 John Dalton Street, Manchester.

BARNSELY.—Jan. 21.—For Building Two Dwelling-houses in Sackville Street. Messrs. Dixon & Moxon, Architects, 5 Eastgate, Barnsley.

BATLEY CARR.—Jan. 18.—For Building Shop and Dwelling-house. Messrs. Kirk & Sons, Architects, Dewsbury.

BECKENHAM.—Jan. 14.—For Works of Paving, Kerbing, and Footpaths Improvement, comprising about 22,000 feet of Pennant stone and granite kerb, 4,000 feet of granite channelling, and 2,000 square yards of 2-inch red brick paving, the Relaying of about 8,000 feet of Purbeck kerb, and other works in connection therewith. Mr. Geo. B. Carlton, C.E., Surveyor to the Local Board, Beckenham, Kent.

BEDFORD.—For Building Bedford Town and County Club. Mr. H. A. Cheers, Architect, Waldegrave Park, Teddington.

BELFAST.—Jan. 13.—For Alterations and Additions to Donegall Hotel, Donegall Square West. Messrs. Young & Mackenzie, Architects, Donegall Square East, Belfast.

BERWICK-ON-TWEED.—Jan. 22.—For Single-lift Gasholder for Works at Spittal, for the Berwick and Tweed-mouth Gaslight Company. Mr. Paterson, C.E., Warrington.

BERWICK-ON-TWEED.—Jan. 22.—For Construction of a Cast-iron Gasholder Tank, at the Works, Spittal. Mr. Paterson, C.E., Warrington.

BIRMINGHAM.—Jan. 12.—For Building Potato Stores, Smithfield Market. Mr. William S. Till, Borough Surveyor, Council House, Birmingham.

BLACKBURN.—Jan. 12.—For Wrought-iron Girders and Castings for Bridge over Blakewater. Mr. J. Braddon McCallum, Borough Engineer, Municipal Offices, Blackburn.

BLACKBURN.—Jan. 12.—For the Supply of Granite, Limestone, Stone for Under-bedding, Lime and Cement, Setts, Sidestones, Circular Kerbs and Flags, Iron Castings, Bricks, Timber, Wallstone, &c. Mr. J. B. McCallum, Borough Offices, Municipal Offices.

BLACKPOOL.—Jan. 29.—For Construction of Gasholder Tank. Mr. Chew, Engineer, Gas Office, Blackpool.

BOLTON.—Jan. 16.—For Construction of Station Buildings at Daubhill and Chequerbent, near Bolton. Drawings and Specifications at the Engineer's Office, Euston Station.

BOLTON.—Jan. 19.—For Construction of Outfall Sewage Works at the Hacken. The Borough Surveyor, Town Hall, Bolton.

BOULTHAM.—Jan. 16.—For the Erection of an Engine-house and Boiler-house, at the Lincoln Waterworks, Boultham. Plans and Specifications at the Waterworks, Office, Saltergate, Lincoln. Mr. H. K. Hebb, Clerk to the Urban Sanitary Authority.

BOW.—Jan. 17.—For Building Stables, Loose Boxes, Omnibus Shed, Foreman's House, and Boundary Walls, for the London General Omnibus Company, Limited. Mr. R. T. Kingham, Secretary, 6 Finsbury Square, E.C.

CALVERLEY.—Jan. 15.—For the various Works in connection with the Rebuilding of Hollypark Mills, Calverley, near Leeds. Mr. Jowett Kendall, Architect, Idle.

CHRISTCHURCH.—Jan. 17.—For Repairs and Alterations to Workhouse, damaged in the late Gale. Mr. Druiitt, Christchurch, Hants.

CLACTON-ON-SEA.—Jan. 21.—For Building Ten Houses for Mr. Charles Garrod, South Lodge, Forest Hill.

CRICKHOWELL.—Jan. 16.—For Building Chapel at Llanbedr. Mr. Aaron Davies, Architect, Pontlottyn, near Cardiff.

CRICKLEWOOD.—Jan. 18.—For Making-up, Kerbing, Channelling, Metalling, and Tar-paving Claremont Road. Mr. J. Pollard, Surveyor to the Hendon Local Board, Brent Street, Hendon.

DUBLIN.—Jan. 24.—For Building a Dispensary in South Earl Street, for the South Dublin Union. Mr. W. M. Mitchell, Architect, 10 Leinster Street, Dublin.

DUMFRIES.—Jan. 21.—For Erection of Station Buildings, Platform, and Platform Wall. Drawings, &c., at the Engineer's Office, St. Enoch Station, Glasgow.

DYMOCK.—Jan. 14.—For Alterations and Additions to Dymock Schools. Messrs. Waller Son, & Wood, Architects, 17 College Green, Gloucester.

EASTBOURNE.—Jan. 31.—For Erection of Town Hall and Municipal Buildings. Mr. Charles Tomes, Borough Surveyor, Eastbourne. Mr. W. Tadman Foulkes, Architect, 100 Colmore Row, Birmingham.

EAST DEAN.—Jan. 17.—For the Construction of an Impounding Reservoir at Greenbottom, in the township of East Dean. Plan and Specification at the Office of the Surveyor, Cinderford.

EAST WALKER.—Jan. 14.—For Building an Infants' School, and for Alterations and Additions to Board Schools. Mr. John Johnstone, Architect, 6 Clayton Street West, Newcastle-on-Tyne.

EBBW VALE.—Jan. 26.—For Building Hotel and Stables. Mr. E. A. Johnson, Architect, Abergavenny.

EDMONTON.—Jan. 15.—For Laying Rainwater Drains, Building Small Pump-house, Fixing Pump and Tank, &c. Mr. T. E. Knightley, Architect, 106 Cannon Street, E.C.

ELGIN.—Jan. 18.—For Supply of Material and Carrying out Works of Water Supply, Westfield. Mr. H. M. S. Mackay, C.E., Elgin.

ELIE, N.B.—Jan. 15.—For Building Farmhouse at Orkie, Kettle. Mr. John Currie, Architect, Elie, N.B.

ELIE, N.B.—Jan. 25.—For Building Coastguard Station. Director of Works Department, Admiralty, 71 Spring Gardens, London, S.W.

ENFIELD.—Feb. 19.—For Building Separate Workhouse Schools. Mr. T. E. Knightley, Architect, 106 Cannon Street, E.C.

FINCHLEY.—Jan. 14.—For Paving, Metalling, Kerbing, Sewering, and Making-up of Brownlow Road and Grunelsen Road. Mr. G. W. Brumell, Surveyor to the Local Board, Local Board Offices, Church End, Finchley, N.

FRASERBURGH.—Jan. 14.—For Building House for Mr. Mortimer, Brewer. Messrs. Jenkins & Marr, C.E., 16 Bridge Street, Aberdeen.

FYVIE.—Jan. 19.—For Building Dwelling-house, Cowhill. Mr. Chalmers, Rothiebrisanne.

GOOLE.—Jan. 14.—For Alterations to Alexandra Street Board Schools. Mr. William Watson, Architect, Wakefield.

GREAT BENTLEY.—Jan. 19.—For Building School and Chapel Keeper's House. Mr. F. Evelyn Morris, Architect, Colchester.

HULL.—Jan. 17.—For Formation of Adit or Tunnel (one mile) from Springhead Pumping Station. Mr. D. Maxwell, Engineer, Town Hall, Hull.

IDLE.—Jan. 14.—For Building Tenter House, &c. Mr. Jowett Kendall, Architect, Idle.

ILKLEY.—Jan. 14.—For Building a large Conservatory at Wells House Hydropathic Establishment. Mr. T. G. Andrews, Architect, Old Bank Chambers, Bradford.

KEGWORTH.—For Alterations and Additions to House. Mr. Arthur Marshall, Architect, Long Row, Nottingham.

KENNY.—Jan. 17.—For Building Farmhouse at Backhill. Mr. John Rust, jun., Architect, 4 Bridge Street, Aberdeen.

KINROSS.—Jan. 17.—For Construction of Works for Supplying the Burgh with Water. Mr. W. R. Copland, C.E., 146 West Regent Street, Glasgow.

KINROSS.—Jan. 25.—For Repairing and partly Rebuilding March Dyke, with Wires on the top, between Kin-

craigie and Pitgorns, near Strathmiglo. Mr. Geo. Bogie, Solicitor, Kinross.

KIRKBY-IRELETH.—Jan. 22.—For Improvement and Re-fitting of the Parish Church. The Committee for the Improvement of Kirkby-Ireleth Parish Church, Kirkby-in-Furness.

# The Architect.

## MEMORY-DESIGN.

It was a principle of some importance which Mr. BERESFORD HOPE referred to in his address at the Architectural Museum last week, when he spoke of the distinction between artistic work which is done from memory and that which is done otherwise. The difference in the result, as the act of designing now goes, may not be very clearly discernible. Design, at least of the ornamental order, has for its chief qualities, first, authenticity of style; secondly, harmony of style; and thirdly, what there may be of special or personal grace. The first is to be derived from a study of "the authorities," the second from their proper appreciation, and only the third from something apart. Instances are abundant wherein the very best art-work of its kind belongs entirely to the authorities. Mr. BERESFORD HOPE has all his life been magnifying this kind of work. He may be said to have been an advocate of authenticity universal and eternal. Art with him has been the rehabilitation of the past or nothing; and this not only with reference to the mediæval modes which personally he has loved so devoutly, but scarcely less whenever his approval has been incidentally conquered for a passing moment on behalf of either the academical relics of antiquity or the fugitive efforts of modern times. Architects and their allies of the drawing-board have had no more exacting critic than he in the direction of an absolute surrender of independence to authority. It must be especially gratifying, therefore, to those who from time to time, in one way or another, have been subjected to his rebuke for an unseemly exercise of "originality" to find that he has on reflection become at last a little less severe. The fact is that the authenticities are losing their influence in the world; and in such circumstances a really observant and thoughtful if dogmatic amateur like Mr. BERESFORD HOPE may still be expected to come forward as a pioneer of change.

The teaching of design has in many ways been made the subject of earnest discussion amongst us; one class of persons affirming, as a mere axiom of its philosophy, that art cannot possibly be taught; and others arguing that, all axioms to the contrary notwithstanding, it somehow or other must be learnt. The difference is manifestly verbal rather than real. No one who knows what the practical work of designing is would ever seriously assert, either on the one hand that the imagination is a faculty to be acquired at school, or on the other that the power of using it can be attained without schooling. The question of Memory-design is, therefore, one of schooling. Whether this may be instruction at the hand of a master, or exercise under self-guidance, is immaterial; it is that actuality which is acquired by education, as distinguished from the potentiality due to native fertility of fancy, which alone is in view. And so the point comes to be this: How far is the student of design liable to have his designing faculty cramped by too exclusive an adherence to the custom of copying examples—say the best examples—and how far may he expect to find his designing faculty freed from restraint if he adopts some other means of exercise? Mr. BERESFORD HOPE's doctrine is that the student should combine with the copying of standard examples an exercise that may be called committing them to memory. This does not, perhaps, go very far philosophically, but the principle is clear enough, so far as it goes, practically.

No doubt there are many ornamentalists who may be said to be almost helpless without a copy. Even amongst architects, with whom it might be thought that, except in the case of a church, which is a subject *sui generis*, no copy could now be of much use, it is notorious that some of the best men will never trust themselves to put pencil to paper without previously looking through their collection of examples. They say it is for the sake of inspiration, and so let it be; but what is now suggested is that this inspiration would come more freely if the examples were stored in

the memory instead of the portfolio or the bound volumes of a professional journal.

There are some who will still prefer to say that it is general principles that ought to be thus introduced into the storehouse of the mind, and not a mere accumulation of specimens—principles to set the fancy going rather than precedents to control it. But this may be so, and yet the doctrine before us remain unassailed. It may not go very far, as we have already said, but it goes at least to this extent—that the study of examples, as unquestionably an essential branch of an artist's education, may be the more effectively pursued by now and then turning the copy to the wall and reproducing it from memory. We need not hesitate a moment in recommending this happy thought—whether original or not, it may be at least new to many—to the attention of all art-students who would cultivate freedom, whether of hand or of head.

## RECENT EXCAVATIONS IN THE ROMAN FORUM.

By R. P. PULLAN.

THOSE who have not visited the Roman Forum for the last two or three years will now perceive a wonderful change. The two roads which ran across it—that in front of the Arch of Septimius Severus, and that which extended from the Temple of Antoninus and Faustina, have been removed, and the whole space as far as the church of St. Francesca Romana has been excavated, so that the spectator, standing in front of that church, has an uninterrupted view, comprising the whole of the Forum and the Via Sacra, as far as the Arch of Septimius Severus. This is not all. The wall of the Palazzo Farnesini has been removed, and the space it embraced on the north of the Palatine Hill has been almost entirely excavated to the level of the Forum. I say almost entirely excavated, because a large body of men are now hard at work removing the last masses of earth which cover the extremity of the house of the Vestal Virgins.

When the work now in progress is completed there will be a complete city of ruins, extending from the Capitol to the Colosseum, within a city of modern houses—an ancient jewel of great price in a setting of modern workmanship, to use a simile employed by Signor BACELLI, the enlightened Minister of Public Works, to whose energy and antiquarian knowledge the great undertaking of laying bare the principal edifices for the benefit of scholars is chiefly due.

The discovery of the site of the house of the Vestal Virgins is one of the most important ever made in the Forum. It was known that this building, which was situated in the Regia given to the Vestals by AUGUSTUS, was in the vicinity of the church of Sta. Maria Liberatrice, because when that church was built (A.D. 1546) pedestals of statues with inscriptions on them relating to the Vestal Virgins were found in digging for the foundations. These pedestals have been unearthed, and remain in the position in which they were found. But neither the position nor the dimensions of the house could be then ascertained. It is now certain that the house of the Vestals consisted of an open court, extending in length from east to west from a point opposite the east side of the Temple of Faustina to a point opposite the east side of the Temple of Romulus, on the opposite side of the Forum. As far as can be ascertained in the present stage of the excavations, this court had a porticus all round it, supported by columns and pilasters, the foundations of which are *in situ*, so that a restoration will be an easy matter. The space enclosed by the walls of the court appears to be about equal to the inner part or court of the Basilica Julia. At the east end of the court is a tablinum, approached by four steps between the columns, which remain in position to a height of about 4 feet. This tablinum has a waggon-headed roof; it is a parallelogram of two squares in plan, and has three small arched chambers on each side. The floor of one of these chambers has been in part removed, and under was a series of half-earthenware jars, probably for the purpose of keeping the floor dry. Another of these chambers is used for the purpose of storing various fragments of sculpture found during the excavations, amongst which are the heads of some of the Vestals. The court is bounded on two sides by wide corridors, from which there are several chambers, evidently the residence

of the Virgins. The whole building, the walls of which vary in height from 6 feet to 30 feet, is of massive brickwork of the third century. The walls of the court have been lined with marble; those of the corridors and chambers have been painted on stucco. A small portion of the painting remains in the south corridor. The statues of the Vestals stood upon pedestals adjoining the wall of the porticus on the sides. Most of the pedestals were found in position: the statues were thrown down. One or two are found every day. When I visited the ruins last week there were ten, now there are fourteen either tolerably perfect or in pieces. All but two are headless. The most perfect wears a veil over a close-fitting cape or coif, and holds in her left hand a bunch of poppies and ears of wheat.

This house—or Atrium of the Vestals, as it is called by ancient writers—was probably erected after the destruction of an earlier edifice by fire in the middle of the third century, all the dedicatory inscriptions on the pedestals being of a later period. As may be supposed the style of the sculptured figures is not of very high character, and they vary in scale from 6 feet to 4 feet in height. In front of the tablinum there is an impluvium about 10 feet square; in this were found several fragments of sculpture.

The general level of the Atrium is four steps above the level of the Forum, near the so-called Temple of Vesta. I say so-called, because the excavations have just partly uncovered the base of an octagonal edifice, of the full width of the court, which may possibly prove to be the base of the true Temple of Vesta, which, we may naturally suppose, stood within the sacred temenos.

Between the house of the Vestals and the foundations of the Palace of Caligula a paved road, leading by a gentle ascent almost parallel to the Via Sacra on the other side of the Forum, towards the Arch of Titus, has been discovered. It can be no other than the Via Nova. This being considerably above the level of the house, is approached by a flight of steps at the back of the chambers, near the south-east end of the court. Arches at intervals span the road supporting the foundations of the palace. The intervening spaces below the palace have apparently been shops. The pavement of the lower part of the road adjoining the church of Sta. Maria is chiefly composed of nether mill-stones, and there are several portions of similar stones built into the wall of one of the shops. In a few weeks' time the excavation of the interior of the porticus will be completed, and the full extent of the edifice ascertained.

The wall of the garden east of Vignola's Gate has been already demolished. The gate itself, which is one of VIGNOLA's *chefs d'œuvre*, is to be carefully removed, the stones being marked so that it can be erected on another site. The excavations here and elsewhere are being carried on most vigorously, and it is to be hoped that the present active Minister may remain in power long enough to carry out his magnificent projects. The transformation of the Forum from what it was when I first saw it, more than twenty years ago, is astonishing. Then the Basilica Julia and the temples near the Capitol alone were laid bare; now almost every building that adorned the Forum has been excavated, and a vast field has been opened for the speculation of antiquaries, who seem determined not to agree as to the site of any one edifice, unless its position be authenticated by inscriptions like that found in the house of the Vestal Virgins.

## BRITISH OLD MASTERS.

THOUGH the British contingent to the ranks of Old Masters within Burlington House is strong by virtue of quality, there are entries of names which have no adequate representation, and might as creditably be absent. For to slip in minor pictures by the men who link the past and the present of the English school—LESLIE, LANDSEER, CRESWICK, and the like—adds no lustre to repute of painters or standard of exhibition. There are a few curiosities in the collection, the value of which lies in their reflex of the opinions or manners of the day, rather than in art merit. For example, one of the pieces of dramatic portraiture for which the German Academician, ZOFFANY, was famous—*Macklin as Shylock*. In face of modern Shakesperian revivals this impersonation of the trial scene in "The Merchant of Venice," with the performers

in the dress of the period, towards the end of the last century, and old MACKLIN swaggering like an irate pork-butcher, with a horrible grin on his face and a carving knife in his hand, an undignified effigy in knee breeches and stockings, what a grotesque contrast it presents, what an astonishing gulf between the attitudes towards the SHAKESPERE drama of the then and the now! ZOFFANY's dry mannerism, that knows no grace, of course increases the ludicrous effect of this apparently drawing-room performance of an actor so celebrated in his day as to have been praised by POPE. The domestic scenes of WILLIAM HOGARTH, great artist as he was, are apt to affect one's risible nerves. The *Music Piece* (22), and more especially the *Breakfast Piece* (38), with the family party and the learned doctor, and the servant attending to the teapot, have such a quaint formalism in their trenchant homeliness; the people have their best manners so obviously upon them, and seem to be addressing one another in set phrases for the benefit of the spectator, as in a scene from genteel comedy on the stage. This "breakfast-piece" is presented by the executors of the late Rev. WILLIAM FINCH to the National Gallery, and should be welcome as an excellent example of this phase of HOGARTH's work.

To turn from such quaint formalisms to the portraiture of the triad, REYNOLDS, GAINSBOROUGH, and ROMNEY, is like losing a fit of the cramp. We pass at once into a company which, if courtly, is easy, where the nearest approach to caricature is an exaggeration of *naïveté* or a touch too much of languid grace, or, maybe, a little superfluous dignity. Even when painting the strange head of the historian *Edward Gibbon*, with its curious likeness to a pug dog, with the capacious brain, the insignificant, turned-up nose, small choleric mouth and rolls of fat chin, REYNOLDS escaped the grotesque. So he did when he painted *Dr. Johnson*, though he caught the great lexicographer's ungainliness to the full. The Academy exhibition has secured some of the best men's portraits by REYNOLDS—strong work with depth of colour and incisive character. It has gained too for itself, and lost for the Grosvenor Gallery, the exquisite *Mrs. Sheridan as St. Cecilia*, and the Marquis of LANSDOWNE's replica of *Miss Morris as Hope Nursing Love*—perhaps the picture most studious in line and form of any that the painter produced. *Lady Lade*, on the other hand, is after a playful, offhand manner, all charm and flutter, in which there is an approach to GAINSBOROUGH's happiest sketches. Between such art-concealing art and the smooth graces of the forerunner of these men, PETER LELY, there seems no immediate link, and yet the VANDYCK tradition did doubtless pass down by way of the showy painter of CHARLES II.'s showy beauties. A sumptuous example of LELY's well-studied draperies and beautiful broad technique, also of a certain luxurious dignity which he could impart to women's portraits, is the figure of *Eleanor, Lady Byron*. The courtly painter has suggested the impersonation of a St. CATHERINE by the introduction of a wheel, which looks like a drawing-room ornament, and by setting a palm-branch in the lady's hand, while the cherubs, holding a flower crown over her head, do not care to conceal that they are cupids of the most frivolous disposition.

ROMNEY's *Mrs. Maxwell* looks elegant simplicity itself after such spurious sanctity, and is besides one of the painter's best painted and most charming full-length portraits. No one makes so much out of a simple white gown as ROMNEY; it seems in his hands the most appropriate garb for a lovely woman. GAINSBOROUGH treated white with less frankness; but we see in *Mrs. Douglas* how deliciously he could work it into a scheme of greys. This portrait, again, is a *cap' opera*, so fine is it in line, and instinct with that delicate intelligence in the head by which, to our thinking, GAINSBOROUGH often surpassed the beauty-loving REYNOLDS.

The representation of the British school of landscape has not the significance of some previous seasons when TURNER and the Norwich school have been in force; nevertheless a very interesting sequence of examples has been gathered. Here are no less than eight pictures by RICHARD WILSON, R.A., none of them in his most ambitious vein or scale, except the *Falls of Tivoli* in the large room, but several of delightful quality. The old-fashioned idealist in landscape has an immortal charm, let the modern tongue disdain him as it may; these ordered Italian scenes or English river-sides are steeped in quiet poetry; the impression they leave is as complete in its deliberate generalisation as from any blurred piece of audacious suggestion from a Paris *atelier* of to-day. Here are two little pictures of the *Lake of Nemi* (Nos. 27 and 57), which

have power to awaken the sweetest of Italian memories. From WILSON to ALEXANDER NASMYTH is to lose much and to gain a little. *Glencoe* has some prosaic boldness in the treatment of the twin-crag and deep mountain pass. A nice little landscape study of cattle standing in a stream beneath tall trees hangs not far off, and claims to be by good JOHN CROME. It has less of his *cachet* than usual, not a bit of loaded making out in it. The sketch for the picture of *Salisbury Cathedral*, by CONSTABLE, is as plucky a piece of work as need be, full of tone and mastery in the blotted free touch and silvery gleam of the Gothic pile rising in the distance. To place such a sketch in such a frame as disfigures it is a mistake unworthy of the discriminating owner, Mr. LOUIS HUTH. There is a delightful specimen of the one English landscape-painter whom France long ago chose to honour, because he worked on French soil and assimilated French art, RICHARD PARKES BONINGTON. It is, however, to no Frenchman but to English TURNER that he approaches in Mr. T. O. BARLOW's *French Coast Scene*, with its lift of hazy rain cloud and gleaming lights over sea and sandy reach. Three pictures claim the name of TURNER—*The Nore*, from the Earl of ESSEX, an accredited and signed composition of angry wave and storm, with fishing-boats and shipping beating about, date 1808. The others are both lent by Mr. H. DRAKE, a little *Seashore*, very luminous and tender, and a larger canvas, *Fishing Boats entering Calais Harbour*, which is doubtless a genuine picture, powerful in the drawing of wave and cloud, if somewhat opaque and slaty in quality and ridgy in touch. The impetuous push and drive of the heavy sea against the pier is splendidly given, and has the true mastery about it. Last, let us not pass by the canvases of "CATTLE WARD," whether he lose his own balance in an attempt to depict *The Fall of Phaeton*, or touch repute and terra-firma in a capital study of *Dalmatian Dogs*, which the knowing in canine breed declare to be faithful in form and hair, while the uninitiated art critic can detect the firm, large draughtsmanship, the solid, if dry, painting of the coats, and the careful accuracy in head and foot.

### ARCHITECTS AND THE DWELLINGS OF THE POOR.

A LETTER has been recently addressed to the secretaries of the Institute of Architects by Mr. MARK H. JUDGE, whose name is known in connection with various public enterprises more or less related to architecture, and who is a member of that body, suggesting that the problem how to house the poor in London and other great towns, being now one of the urgent questions of the day, should be taken in hand by the Institute; it being impossible, he argued, that any adequate practical solution can be arrived at without that particular kind of aid which professional architects alone are competent to afford. We commend this proposal to our readers, and heartily endorse the argument upon which it is based.

True to its present policy, the Council of the Institute, intercepting Mr. JUDGE's communication as a matter of its own private business—one of the "affairs" of the Society which it is the prerogative of the Council, according to the new doctrine, to "conduct"—promptly dealt with it, and by means of a sort of syllogism snuffed it out. The logical formula is worth quoting. "A generation ago," say the secretaries in their reply, "a member of the Council made a noble effort" in connection with the subject; and "persons in authority, just awakened to the facts, may perhaps be astonished" if they will inquire about this. Therefore "the means at the disposal of the Institute are too small," and so on; and Mr. JUDGE is not even referred to some other professional organisation, such as the Architectural Association, the Builders' Society, or the Society of District Surveyors, whose means are larger. It has to be explained that the good work which the Council takes credit for, as having been done by one of its members, is the earnest literary labour so long devoted to the cause of sanitation for the humble by Mr. GEORGE GODWIN; and if the connection between this and the operations of the present governing body of the Institute of Architects should not be at once apparent, it must be further explained that Mr. GODWIN, having "a generation ago" served as a vice-president under Earl DE GREY, is an honorary "member of Council" for ever under Mr. HORACE JONES and his successors, not

expected to attend the meetings, and not allowed to vote. Therefore his work is the work of the Council.

Perhaps, however, this kind of reply to Mr. JUDGE's letter may have been but one of those instinctive secretarial pleasantries which sometimes do so much to relieve the tedium of official administration; but at any rate we certainly must take leave to express our regret that the Institute should lose a chance for manifesting in these businesslike days a disposition to take its share in public business. Architects as a profession have been somewhat severely handled on behalf of the public for a good many years. It has been freely argued that they are pleasing picture-makers, sentimental antiquaries, learned and pious ecclesiologists, and many other honourable but futile things, rather than the practical and ingenious contrivers of common house-building whom "the British public" desire to have at command. It is seldom that any opportunity occurs for the plain, sound building-men of the profession to come forward to show the fallacy of all this. Mr. JUDGE, we repeat, is quite right in pointing out that, in the solution of the problem now attracting so much attention, those building-architects must supply an indispensable element. The only doubt about the matter seems to be how to bring the right class of men forward.

We cannot on any account admit that the Institute is not the proper professional body to take the lead. We are in hopes that the Council, now that the members at large have begun to claim a little more interest in their "affairs," may yet be induced to take the initiative, however formally. But there is one other body to which we think the appeal of Mr. JUDGE might be transmitted, namely, the Association of District Surveyors. There are more than sixty of these official architects distributed over London in the daily discharge of important duties of supervision relating to building. Not only every new house that is erected, but every old one that is altered, every one that is involved in neighbouring operations, and especially every one that is complained of as being in an unsatisfactory condition, has to be carefully attended to by those functionaries in minute detail. It is not too much to say, therefore, that the structural aspect of the problem before us, and the structural statistics which bear upon it, in the widest sense of the term "structural," must be familiar to the sixty district surveyors of London as a body, in such a way that their collective opinion would be of the utmost value upon whatever point they might be induced to consider, and certainly amongst the rest upon the question how to deal with the slums of London as a whole in a perfectly practical manner. If the Council of the Institute should still persist in rejecting Mr. JUDGE's well-meant proposal, we hope the district surveyors will take it up; but we should much prefer to see the matter submitted to them by the Institute, for the sake of the Institute's credit with the public.

### PARIS NOTES.

A PETITION has been sent to the Senate from MM. Gérôme, Carolus Duran, Boulanger, Baudry, Duez, Roll, Guillaumet, Gerola, Thomas, Lansyer, Guilbert, and other French artists in favour of M. Bardoux's Bill establishing certain guarantees for the property of artists in their work.

At last week's sitting of the Académie des Beaux-Arts, under the presidency of M. Guillaume, M. Chaplain read a paper on the life and work of his predecessor, M. Getteaux. M. Guillaume was appointed a member of the Committee for the Prix Fould, value 20,000 frs., given for the best work on the "History of Design."

In the competition for the design and execution of the statue to be raised to the Abbé Grégoire at Lunéville, the jury awarded the first prize to M. Charles Elie Bailly, who will carry out his project. MM. Laurent and Johann, who came second and third, received 1,000 and 800 frs. respectively.

A new gallery to be devoted to modern French pictures is being prepared at the Louvre in the large hall known as the Salle des Etats, formerly constructed for the sovereign to receive the two Chambers at the opening of the Parliamentary session, and which has been lately given up to the administration of the museum. The principal rooms at the Louvre being occupied by

the works of the old masters, those of the modern French school, when removed there from the Luxembourg after the death of the artist to make room for the works of contemporary painters, have to be placed in small, crowded, and badly-lighted rooms in the upper storeys, rarely entered by visitors, and where they are quite lost sight of by the general public. Thus literally stowed away are some of the best works of Ingres, Ary Scheffer, Delacroix, Delaroche, Horace Vernet, Daubigny, &c., that certainly deserve to be made more accessible. The task of appropriating the Salle des Etats for its new destination will, however, occupy some time, and it is scarcely probable that the new gallery will be ready before the beginning of next year. The old roof of the hall, which is about 135 feet long by 63 wide, has already been removed and replaced by glass skylights.

The Administration of Fine Arts have decided during the present year to complete the restoration of the Château de Pierrefonds, taken in hand fifteen years ago by the late Viollet-le-Duc. The cost of finishing the work of restoration is estimated at 100,000 frs.

An interesting discovery of decorative paintings has been made in the old palace of Cardinal de Rohan in the Rue Vieille-du-Temple, formerly known as the Hôtel de Strasbourg, and occupied since 1808 by the National Printing Office. A large room on the first floor, until recently used as a library, being cleared out for the removal of its contents to the storey below, it was remarked that the paper on the walls was adherent to canvas stretched along the sides from the ceiling to the ground. The removal of this paper brought to light a dozen panels, painted by Christopher Huet, representing the loves and games of Arcadian shepherds and their consorts, who are sporting in gardens amid flowers, birds, monkeys, and dogs. One panel only was missing, having been cut away for a door, but it was found in a loft, not damaged beyond restoration, while the others are in an excellent state of preservation. It may be noted that the National Printing Office was already known to contain many valuable works of art, among them being two landscapes by Boucher, signed and dated 1751; a superb Boule clock—much remarked at the 1878 Exhibition—and the remarkable bas-reliefs, cited in the "Historical Dictionary of Art" as "Un Phaeton groupé par le Lorrain," which is to be seen above the entrance to the old stables, having hitherto suffered but little from the weather. Altogether, the Imprimerie Nationale is well worthy of a visit from all art amateurs.

The published accounts, made up to December 31 last, of the subscription fund for the construction of the church on the heights of Montmartre, show that the sums actually received amount to 13,500,000 frs., and money is still coming in well. From the month of March the building committee has decided to increase the number of workmen to 500, a measure that will considerably accelerate the completion of the edifice.

The death is announced of M. Léon Noël, an artist who had made himself well-known by his lithographic reproductions of many masterpieces of the French school of painting.

According to the Paris *Rappel*, women, who have already succeeded in forcing the portals of the Medical School, are mounting to the assault of the Department of Fine Arts. A young American lady, Miss Laura White, has obtained entrance to the special school of architecture directed by M. Trélat. It has been ascertained that there are many women employed in the building trades, either as shop forewomen or managers of works. The fine carpentry work in the Passy Mairie was designed and executed by a lady, who is at the head of one of the largest decorating firms in Paris. Many other instances might be given of the solid footing now being gained by women in the field of construction; and again, to quote our Paris contemporary, "we may shortly expect to have women-architects, who, without doubt, will largely help to relieve, by their grace of idea and imagination, the somewhat dreary appearance and monotonous style of modern architecture."

The Committee of Historical Inscriptions have decided to place on the façade of the Chamber of Notaries, in the Place du Châtelet, a commemorative tablet, indicating that the building

occupies the site of the former Prison of the Grand Châtelet. To the tablet will be added a small model of the famous fortress.

A new school of design has just been opened at 19 Rue des Petits-Hôtels. It is intended specially to afford instruction in the application of the fine arts to such industries as ceramics; glass and enamel working; wood, marble, ivory, and metal carving; the design of fabrics; and decorative painting. The number of pupils is limited to 100, who will all be required to pass a preliminary entrance examination.

M. Taine, the Academician and Professor of *Æsthetics* and the History of Art at the Ecole des Beaux-Arts, has resumed his bi-weekly course of lectures before a very numerous audience. The subject of the present series is the history of painting in the Netherlands.

### THE ENGLISH FLOWER GARDEN.\*

THE flower garden has not been free from the influence of the revolutionary spirit that has been felt by things of more importance, and, as happens elsewhere, the tendency now is to introduce a close approximation to what is supposed to be dictated by Nature. For three centuries, if not for a longer time, it has been supposed in England that there should be a relationship—more or less close—between architecture and gardening, and the Anglo-Italian houses and gardens have been often laid out by one master mind. It would seem to have been the endeavour to permit as little contrast as possible between art and nature, and the terraces, fountains, lodges, &c., were the means adopted to allow the building to merge as it were into the garden, while the formalism of trees and hedges corresponded as far as was practicable with forms made of stone. We need not go further back than the end of the last century to see the hold which this artificial spirit had upon men's minds. Uvedale Price wrote several essays in the hope that he might dissuade people from adopting it, and he regards himself as a sort of forlorn hope in having to attack so strong an institution. In one place we find him suggesting that a "dressed lane" was not pleasing to a painter's eye; he pities "the poor pinioned trees of a gentleman's plantation"; and he goes so far as to assert that as despotism is the most complete leveller, so "he who clears and levels everything round his own lofty mansion seems to have very Turkish principles of improvement." William Kent had attempted a reform before Price wrote, but it amounted to little more than a change from squares and parallelograms to segments of circles and ellipses, from straight alleys and terraces to curved gravel walks. Capability Brown followed and acted on the principle of making a small parterre a model. As Price says, he "transferred its minute beauties, its little clumps, knots, and patches of flowers, the oval belt that surrounds it, and all its twists and crincum crancums to the great scale of nature." The clump was supposed to be the soul of a garden. So well was Brown's style recognised that once when he was high sheriff, and the attendants were straggling, a wag called out and advised him to "Clump your javelin men."

Although it was derided by many judges, what may be called the artificial system has always had admirers. So long as residences were Italian in style it was considered to be proper that the surroundings should also be Italian. Nor is it certain that the arrangement displayed bad taste. What is to be seen at Trentham, Thoresby, Highclere, and Clumber, among other places, is not without fitness. Mr. Robinsen, who is an enthusiast for the natural style, refers to the gardens at the Crystal Palace as evidence of the absurdities of the formal style. But the Sydenham gardens, when first seen, gained the applause of every gardener that saw them; and if they now appear in a condition that is suggestive of the yard of some bankrupt manufacturer of figures and vases in artificial stone, the cause is partly owing to want of money, and partly to a change in the public taste. It will be said that a garden need not demand so large a sum for its conservation, and there is much truth in the objection. A garden in any form is an expensive delight, and the Italian is of all forms the most expensive. But cost is not now the question. What we maintain is that the formal garden, call it Italian or what we will, has for centuries given delight to many men who were eminent for their good taste; and although there may be a change in fashion, there is nothing in that style of laying out ground which is intrinsically wrong. The garden with its fair columns, arches, and turrets which Bacon loved was formal, so was the garden which Descartes cultivated at Amsterdam during his exile, so were the gardens which made Cardinal Newman desire above all things to become a gardener in some great family. When Mr. Robinson asks, "What can we think of those who carry the dead lines and changeless triumphs

\* *The English Flower Garden: Style, Position, and Arrangement.* By W. Robinson, with the co-operation of many of the Best Flower Gardeners. John Murray.

of building and the studio into the garden?" we reply in the words of a man who was one of the best gardeners of his age, and who was one of the first to advocate the natural system, the poet William Shenstone, who said:—"A rural scene to me is never perfect without the addition of some kind of building; indeed, I have known a scar of rockwork, in great measure, supply the deficiency." Shenstone wrote in this way; not that he was an admirer of rockwork or builders' work, but he knew the value of contrast in gardening as well as in poetry, and felt that without its aid even natural forms will in time lose some of their charm. In his words, "Negligent of graces that have the merit of reality, we too often prefer imaginary ones, that have only the charm of novelty; and hence we may account in general for the preference of art to nature in our old-fashioned gardens."

There is a tendency in human nature to exalt one's opinion and to maintain that it alone is the truth; and in gardening there are infallible formalists and infallible naturalists, who condemn the system that is not their own. Why should it not be recognised that each system has merits, but inasmuch as a great deal depends upon the character of the ground, and of the house to which the garden is attached, one system is often more eligible than the other? Even rigid geometrical beds can have a charm, and in fact they are not more absurd than the laws of poetry, by which words are placed in certain fixed positions in order to gain effect. Mr. Carlyle was a poet by nature, but he held metre and stanzas in as great abhorrence as Mr. Robinson holds "oilcloth and carpet patterns" in flower-beds. Neither in one system or the other can judgment be dispensed with, and it is as easy to have a flaunting, vulgar garden on natural as on formal principles. If, like the late Dante Rossetti, we allow flowers and weeds to follow their own sweet wills, there will be a chaos after a few years that is not without picturesqueness; but, if we once seek after order, we cannot do it by halves. The wilderness in Rossetti's back-garden (and which is to be seen also in old-fashioned gardens that have been long unlet) was more pleasing than a great many costly examples of gardeners' skill.

We are not advocates of the formal system exclusively. The type of garden that, speaking generally, is best adapted for England would be one like Mr. Tennyson's in the Isle of Wight, which is described by him as "a careless-ordered garden." It would correspond with Shenstone's test of effect, which was to consider how a garden would appear if made the subject of a picture. The majority of English painters would select a natural garden, but occasionally there are men like Callcott and Dodgson who prefer some sort of architectural form as a balance to the wildness of nature. In doing so they but followed the example of Claude Lorraine.

Whatever system is adopted, there cannot be a better guide to the selection of flowers than Mr. Robinson's book. It may well be termed exhaustive. The flowers are arranged in alphabetical order, and comprise every variety that will grow out of doors in England. Mr. Robinson's taste is catholic in its comprehensiveness, and he finds use for flowers which might be termed "old-fashioned" and are despised by the fashionable florists. Even the sunflower has praise for its robust growth and commanding aspect. In every case full directions are given for the culture of the plant. The volume is illustrated by a thousand or more excellent woodcuts, in which the characteristics of the flowers are as well expressed as it is possible without colour. In the preparation of the book Mr. Robinson has had the aid of a great many flower-growers, and their united experience has resulted in a guide which on the subject is a library in itself.

### ST. MATTHEW'S CHURCH, IPSWICH.

THE following report on the condition of St. Matthew's Church, has been prepared by Mr. E. F. Bisshopp, architect:—

1st. South aisle and chancel aisle. The walls are fairly plumb. The unevenness visible in places in the south aisle I attribute to the walls having been too rapidly built at first, before the work had fairly time to settle. The outer face of these walls is in a decayed state, and the old cement stone here reused has become thoroughly rotten from the action of the atmosphere. The whole of the buttresses to this aisle are all more or less affected, many of the quoins have become detached from the rubble, and the stonework of same is much decayed. The quoins are insufficiently tied in, and the workmanship and material are of the poorest description. The fifth buttress shows distinct signs of outward thrust, caused by the arch dividing off the chancel aisle, and this is a serious matter, the construction of this arch being such that a very slight inclination of the abutments would inevitably cause it to collapse. The cement coping is weather beaten, and is cracked and in holes, and the stone coping to the chancel aisle is extremely decayed. The porch also needs repair to arrest serious mischief. The stonework of the windows is rapidly decaying.

The roof of the south aisle, as at present existing, is to be regarded with apprehension, and, I have no hesitation in saying, would become positively dangerous under a heavy load of snow. The timbers are extremely slight and meagre for such a span, and

they are, moreover, greatly weakened by the method of framing. The tie beams, which are supposed to take the weight, really do not perform this office, the whole of the load being thrown on to the purlins and intermediate principals; these are consequently sagged to such a degree as to cause the roof exteriorly to take the form of ridges and furrows. Under a serious strain the timbers would be likely to collapse between the tie-beams, leaving the latter intact. The boarding is an inch thick only. The slate—or rather slab slate covering—is very heavy, the slabs are about  $\frac{1}{4}$  inch in thickness, and from 2 to 3 feet square. The carved figures forming the bosses to the cantilevers are of high interest, being probably all that is left of the timbers of the old roof to this aisle. The figures are of oak of the date of the sixteenth century, of different designs, some bearing shields with the emblems of the Passion carved thereon. The roof timbers are in a fair state of preservation, though I notice in places they have been strengthened by irons.

With regard to the remedy of the defects mentioned above, I would advise that the heart of the walls of the south aisle be examined, and if proved fairly sound, the outer face might be skinned off, and the walls refaced in random flint and stonework, set in blue lias or Peterborough stone lime, well bonded in at intervals. The quoins to the buttresses to be renewed, and the latter cased up with similar facing, with Ancaster stone dressings and weatherings, and of a similar design to those of the north aisle. The fifth buttress before alluded to as showing signs of thrust, to be taken entirely down and rebuilt. The present parapet to be removed and others of a more worthy and lasting character provided.

The roof can be made safe and secure by the insertion of extra tie-beams under the intermediate principals, of like detail to present trusses, with struts therefrom up to the purlins, and the insertion of struts from the present tie beams to the purlins. Should the heart of the walls prove unsound, it will be a question whether to do the work above-named to the roof, and merely repair the present work outside (though in this case it cannot be made to last), or to contemplate a more serious reparation.

2nd. The tower presents no anxiety with regard to stability, being with the exception of the modern plaster-work and parapet, and other minor details, in a remarkably sound stage of preservation. The plastering which so defaces the upper stage, however, is in a bad state, and portions are liable to fall at any time. The coping also is split, and allows the water to percolate into the walls; the roof is not strictly water-tight, and the base of the tower and plinth thereto requires immediate attention. The stonework to the windows in the belfry is in a bad state, and in one instance, at least, quite unsafe. The date of the erection of the tower has been put at about the year 1400, but I am inclined to think that this is not early enough. The present outside facing is certainly not the original, the brick headers used in with the cracked flints and rubble being of quite different make and dimensions to the bricks on the internal face, which are very thin,  $1\frac{3}{4}$ -inch thick and 8 inches long, and are Roman bricks. The absence of buttresses, and rising as it does by stages, also are characteristic features of early towers. Doubtless originally an interesting window existed above the poor and modern west door, the present window having been inserted in its place at the time of the erection of the present south aisle, though the arches and inner jambs are left intact.

The wooden framework of the bells I believe touches the face of the walls in places through the crevices being filled up with dirt, and if so it requires attention. The staircase turret—added I should say early in the seventeenth century—is built partly of old Roman bricks. The removal of the plaster from the upper stage of tower will be a work of interest, as I am inclined to think beneath it may be found the original face and possibly some remains of early work; in this event my design might be modified. The windows in this stage are Early Perpendicular. The two lower stages are built battered inwards as much as 3 or 4 inches in the height of each, which of course adds to the strength of the tower, but the walls of the top stage are upright.

The design for the restoration of the parapet and upper stage, which I have the honour to submit herewith, shows the removal of the present modern parapet and the substitution of a battlemented stone parapet, with panel-work below it, in freestone and dressed flints, moulded string course, and gargoyles of Decorative style. I would propose to take up the leadwork of roof and relay it, taking the whole of the water away by a down-pipe on to the roofs on the east side. The face of the upper stage to be removed, if required, and the quoins repaired where necessary.

The Government have accepted the tender of a local contractor for the erection of the convict barracks, the governor's residence, and the warders' houses, at Dover, in connection with the new harbour works. The amount of the tender is 25,000*l.*, and the work is to be completed in twelve months. The contractor has already commenced to lay out the ground for the work, and it is calculated that, in order to carry it out within the time, it will require the employment of a staff of at least 300 labourers. Additional blocks of buildings will afterwards be erected by the convicts themselves.

## NOTES AND COMMENTS.

AN inquiry is to be made into the Architects' Department in the Irish Office of Public Works. We have more than once drawn attention to the anomalies of this department, which are not surpassed in any of the circumlocution offices. The Commissioners of Public Works have charge of very large building works, but from the formation of the Board not one architect has been appointed as a member. The architects are, in consequence, controlled by civil and military engineers. There has been a large increase in the architectural work, but the staff has not been increased in a corresponding ratio, and the members do not receive that recognition of their services which is their due. Architects who have charge of important public buildings are ranked as clerks of works, and it requires about fifteen years of service to entitle them to an increase of salary. All the defects of the department will never be brought to light until the inquiry into its constitution is partly undertaken by an architect. The work of the present inquiry will, it is understood, be conducted in private.

MR. FRANCIS HOLL, A.R.A., who died on Monday, had, like his father and grandfather, gained repute as an engraver, and it might even be said that there was a family likeness in their work. They were all at their best in engraving portraits, but they all produced large plates of historical subjects. FRANCIS HOLL, who was born in 1815, assisted his father, and his hand was employed on almost life-size copies of portraits in crayons by Mr. GEORGE RICHMOND, R.A., which in their peculiar style have never been surpassed. Mr. HOLL engraved the plate from *ELMORE'S Invention of the Stocking Loom*, which was first used as an Art Union plate, and then was presented as a prize to the purchasers of books in numbers, and the large *Railway Station*, after Mr. FRITH's companion to the *Derby Day*. His best plate is probably the *Paolo and Francesca*, after GUSTAVE DORÉ. His portrait engravings are very numerous. Mr. HOLL was well adapted to express faces of a soft, gentle kind rather than those marked by vigour, and hence he was always successful in his copies of the photographs of the late PRINCE CONSORT.

THE arrangements for the distribution of the funds—amounting to over 2,700*l.*—collected for the JOHN HENRY CHAMBERLAIN Memorial, have been approved by the subscribers. Four free scholarships in the Central School of Art will be awarded in alternate years, two to male and two to female students in the branch schools, preference being given to the children of artisans. The class fees will be paid out of the investment of the fund. The balance of the income derived from the investment will be appropriated to the maintenance and development of the Midland Institute, an institution which owes much of its success to Mr. CHAMBERLAIN'S fostering care.

THE creation of bishoprics which will disturb ancient landmarks has aroused the ire of Mr. E. A. FREEMAN. The custom from the earliest ages was, he says, to make the temporal and ecclesiastical divisions coincide. In several countries of Europe the ancient principle has been again followed by adapting the ecclesiastical divisions to the modern temporal divisions. With regard to the proposed diocese of Southwell, Mr. FREEMAN says:—"In all these matters it is often curious to see the weight given to mere sentimental antiquarianism, while the practical lessons of history are trampled under foot. Forty years ago the architectural majesty and ancient associations of Southwell Minster could not save it from degradation from the rank of a collegiate church. That rank it surely ought to have kept; but it is a grotesque absurdity, when a bishop is wanted for Nottinghamshire, to plant his bishop-stool in the village—it is hardly more—of Southwell, while the great town of Nottingham stands ready as the natural centre. The practical minds of the bishops of the eleventh and twelfth centuries, who shifted their sees from Crediton to Exeter, from Dorchester to Lincoln, would assuredly have been moved to scorn at such a scheme as this. Undoubtedly the great church of Nottingham is very far from being equal as a building to that of Southwell; but REMIGIUS or HUBART LASINGA would have settled that difficulty by building a church at Nottingham greater than either."

THE appeal to the City for contributions towards the expenses of the International Health Exhibition has been fairly successful. The Corporation have not only subscribed but paid over the sum of 5,000*l.*, and a further sum of 10,000*l.* is guaranteed. The following Livery Companies have already subscribed:—The Grocers' Company, 1,000*l.*, with a guarantee of 2,000*l.*; the Clothworkers', 200*l.*, and a guarantee of 300*l.*; the Fishmongers', 200*l.*, and a guarantee of 400*l.*; the Goldsmiths', 200*l.*; the Salters', 200*l.*, and a guarantee of 200*l.*; the Wheelwrights', 100*l.*, and a guarantee of 1,200*l.*; the Dyers', 105*l.*; the Joiners', 105*l.*, and a guarantee of 210*l.*; the Merchant Taylors', 105*l.*; the Saddlers', 105*l.*, and a guarantee of 210*l.*; the Skinners', 105*l.*, and a guarantee of 105*l.*; the Spectacle Makers', 100*l.*; the Coachmakers', 31*l.* 10*s.*, and 63*l.*; the Plumbers', 100*l.*; and the Horners', 25*l.* There are other companies who have yet to subscribe, and the delay retards the formation of the general committee of the exhibition.

A COLLECTION of drawings and photographs of some of the old buildings in Birmingham was exhibited this week at the conversazione of the Birmingham and Midland Institute. It was the work of the members of the archæological section, and the views were arranged by Messrs. J. A. COSSINS, PEARCE, and WILLIAMS. The collection was commenced in 1866, at a time when the Corporation projects for forming new streets threatened the destruction of much that was interesting as relics. The views are now invaluable. It deserves to be mentioned that the Corporation have likewise utilised photography in order that a record of the old streets which have been displaced may be preserved.

THE report of the "Old Mortality" Society, or National Association for Preserving the Memorials of the Dead, has some points of interest. The use of monuments is not always evident; for the majority of people are, as GRAY said, destined to be the prey of dumb forgetfulness, and the masons' craft cannot resist oblivion. But some tombs have acquired importance, and in these cases they deserve to be kept from ruin. Hitherto the committee of the Association have acted generally with discretion in selecting cases. No one would object to a little outlay on the tomb of one of the DIBDINS or on the grave-stone of Mrs. BRACEGIRDLE, the actress. But unless the monuments are interesting from their style, there is no reason why the public should care much about "Sir JOHN NEWTON, his wife, and twenty children," or a "Dr. HAMILTON" who died in 1812, or the father of a regicide, or some of the custodians of the QUEEN of SCOTS. The Council are considering the question of King HAROLD'S grave at Waltham; but in cases of this kind which are the subject of controversy it would be more prudent to be inactive. It is said that copies are being made of all the memorial inscriptions in the cathedral, churches, and burial-grounds of Norwich, and if this undertaking is carried out for all England the result will be appalling.

FOR some time past apprehension has prevailed respecting the future of Mont St. Michel and its buildings, priceless as relics of the past that it bears. A causeway, or dyke, was constructed about four years ago to connect the Mount with the mainland. In consequence of this barrier, the rapid tidal currents which prevail round the island are affecting the cliffs of the Mount itself, and so undermining the ramparts and buildings of the monastery. Such at least is the contention of some archæologists and artists, who demand the abolition of the dyke. M. ANTONIN PROUST, ex-Minister of Fine Arts, has taken the lead in this demand, and has brought the matter before the Chamber of Deputies by an interpellation addressed to M. RAYNAL, the Minister of Public Works. That gentleman affirmed in reply that the dyke was in no way the cause of the ruin with which the buildings on Mont St. Michel are threatened, but that on the contrary it was a generally recognised improvement. The reporter of the Parliamentary Committee, appointed some months ago to consider the question and fix upon the best measures to be taken for the preservation of the Mount, sided with M. RAYNAL; while M. DE DOUVILLE-MAILLEFEU created a diversion by expressing the opinion that the responsibility lay at the door of the Fine Arts authorities. The debate resulted in the adoption of the "order of the day," thus involving the rejection of M. PROUST'S motion for the removal of the causeway.

SKETCH DESIGN FOR A PRESBYTERIAN CHURCH, GLASGOW.

MESSRS CAMPBELL DOUGLAS & SELLARS, ARCHITECTS

THE ME

MARK J. LANSDALL,

9 19<sup>th</sup> 1884.

RIDAMS.  
A.B.A. ARCHITECT

Engraved by J. G. Smith, London. Printed by J. G. Smith, London.

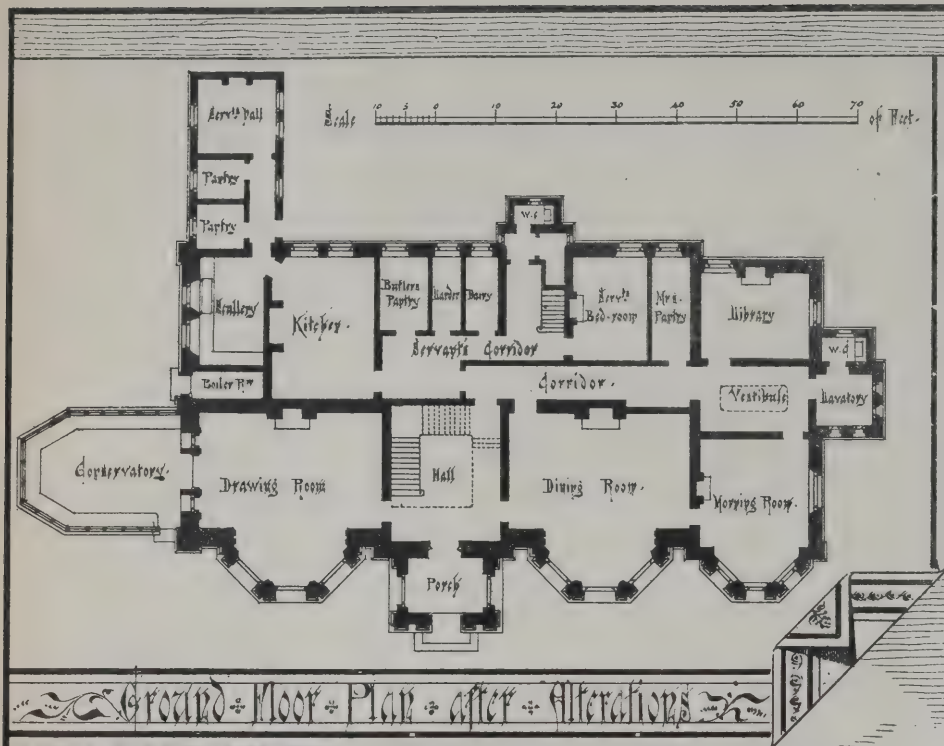

19<sup>th</sup> 1884

John Murphy Esq. J.P. Geo. C. Seblin S.R.H.N. ARCHT. & BUILDER

## ILLUSTRATIONS.

DESIGN FOR NEW CHURCH, GLASGOW.

THE design was prepared for a Presbyterian church in the neighbourhood of Glasgow. It is a notable attempt to provide in the best manner an auditorium in which every person can see and hear the preacher. That is really the most important consideration in a Scotch church where sermons are the chief part of the service. A church of similar arrangement has been built in Dunfermline from plans by the same architects, Messrs. CAMPBELL DOUGLAS & SELLARS, and it has been found very successful acoustically, and convenient for its purposes. An illustration is reproduced in ink-photography of a water-colour sketch by Mr. SELLARS.

THE MERRIDAMS.

THIS view is from the design of a house in English half-timber style, by Mr. MARK J. LANSDELL, A.R.I.B.A., the lower portion being of stone. The corner bay window forms a "snuggery" in the drawing-room. The square bay projects from a side of the dining-room. The room with the double bay window over the entrance forms the best bedroom, and over that is placed the smoking and billiard-room. The kitchen, offices, stables, &c., are placed in the rear, extending to the right.

ANNEMOUNT, CO. CORK.

THIS building is situated on an elevated site, and commands an extensive view of Cork harbour. Before the present course of alterations were commenced there existed two distinct houses, which have been remodelled and converted into one, as shown by the plan which accompanies our view. The principal additions comprise front bay windows and portico, campanile, conservatory, and servants' hall. The architect is Mr. G. C. ASHLIN, A.R.H.A., Dublin, and the builder, Mr. McMULLEN, Cork. The total cost of the work is about 2,500*l*.

## NORTHERN ARCHITECTURAL ASSOCIATION.

A MEETING of the Northern Architectural Association was held in the Old Castle, Newcastle-on-Tyne, on the 8th inst., when the president, Mr. Frank W. Rich, delivered his inaugural address. Two broad subjects, it was said, presented themselves for consideration—one was professional matters, the other related to the public. The art of architecture was popular at present, but architects were not so. This unpopularity was to be attributed in a great measure to the medium degree of excellence exhibited by many of the workmen, and to the want of solidarity between them and architects. Let an architect plan ever so cunningly, said Mr. Rich, his work may be all swamped in its execution. But from what source do we draw our workmen? Will it be believed that practically there is scarcely an apprentice in the majority of the building trades in Newcastle. From whence, then, do we draw our supplies? I am afraid we get the majority of our men from the "jerry" source, or in other words, the speculating builders, and a few are drafted from the country. Time was, and not very long ago either, when every workman had to serve seven years' apprenticeship, and could produce his indentures to that effect. What have we now? A youth in going to business can scarcely get into the best shops. I have discussed this question frequently with some of the principal contractors in this city, and I get one general answer:—"Apprentices are more bother than they are worth." A more deplorable answer can hardly be imagined. So what does the youth do? He gets employment with the jerry builder, passes two or three years in this slipshod school, and then launches himself on the world as a full-blown journeyman, often by the time he is eighteen or nineteen years of age. No wonder that with such a training we should get such indifferent work, for which architects too often get the blame. If the workman is not fitted to do good work no amount of supervision on the part of an architect can alter him. It can only be done by a thorough training in youth. While speaking of apprentices in the building trades we must not forget our own, or pupils as we call them, and we shall find a state of things which is not altogether satisfactory, but arising from different causes to those of the building trades; and if this Association can do anything to better this state of things it would deserve the thanks of the whole profession. A youth under present conditions remains at school until he is about eighteen years of age, and then comes into an architect's office to try to master in three years a some-

what lengthy programme. As I said before, seven years used to be considered a fair time for an apprentice in the building trades to master his trade. Now, we generally consider there are roughly seven trades in what we call the building trades, yet the architectural pupil very frequently endeavours to master in about three years, not only the fine art and theoretical portion of his profession, but also the principles of the whole of the building trades, which will enable him to understand his work. I do not mean to say that it would require the pupil seven times seven years to master all this fine art, theoretical and practical work (although, goodness knows, it takes a long time), but I do mean to say that with the facilities available in Newcastle, a youth has not a chance, when in office, of becoming proficient as an architectural draughtsman in the time allotted to him; and what I mean to adduce from these facts is this, that this Association should endeavour to found some source of education (a chair of architecture in the college for instance) or class work in connection with some institution, and where a youth could largely augment his knowledge either in the daytime or of an evening (for in this high-pressure age in which we live there is little time for leisure), and which would go hand in hand with his day work at the office and render him at the end of his term a really useful architectural draughtsman, or a member of a responsible profession. I will myself, with the permission of this Association, gladly give a money prize to *bona fide* pupils of architects for the best specimen of work either in drawing or other. In the details of such a scheme the Association will no doubt wisely decide, and will perhaps be the means of producing something better than the exhibition of such dreadful so-called architectural pupils' drawings which were lately on view in this city. Our large cities and towns are developing and extending at an enormous rate. The old thoroughfares (like the old sewers) are inadequate. Buildings are now required that fifty years ago were not dreamt of, and there is a difficulty in procuring suitable sites for them. It is clear we must augment our thoroughfares in what we call improvements to the city, and that all our public buildings should adorn and beautify the city. This, it must be admitted, is a very broad subject. But is it not a fact that all so-called improvements—not only in this city, but in almost all others—are not the result of a well-devised and comprehensive scheme, but one worked out piecemeal by the Council collectively, where nearly every member individually would hesitate before attempting such a task? Let us see what is done by a neighbouring corporation—the River Tyne Commissioners. They have charge of what is now a noble river; it was not always so. They have improved it. But they do not attempt to do it themselves. They placed the matter in the hands of an eminent man years ago, and consistently follow a well-devised and comprehensive scheme, which has taken, and may yet take, many years to complete. I do not mean to say that a city like this could be improved at such a rate as the river has been; but I do say this, that if the planning of the improvements to a city were placed in the hands of a similar eminent man—and it seems to me that, as the question is of such architectural importance, that man should be an architect—and he was asked to thoroughly consider and show the best way a city could be improved to meet existing and future wants, I have no doubt the result would be similar to what we see in the river improvements, viz., a whole scheme, a comprehensive plan in every respect, and not one of "shreds and patches." It would show, most probably, main thoroughfares only; for, after all, the old turnpikes "rule the roost," and point the direction of new main thoroughfares. Subsidiary streets would follow by private enterprise; open spaces would be indicated, and sites for public buildings, whereby grand effects in "townscape" (if I may use the word) might be obtained.

Mr. Rich next spoke on the causes of the high death-rate in Newcastle-on-Tyne, and concluded by referring to sanitary associations. These associations, he said, would seem, on the first blush, to be very desirable institutions, but on more mature consideration they do not seem so desirable. Sanitary associations and companies may in some instances do more harm than good, unless they are officered by men who, by their education and practice, are peculiarly fitted for the task. Architects are ever too modest. It is they who should have started a sanitary association, and the association would not then have been trespassing on ground already occupied by men who, I maintain, have kept themselves as much to the front in the march of science as their fellows.

Mr. Thomas Oliver, hon. sec., proposed a vote of thanks to the President for his able and practical address. He said that he believed a system would be shortly introduced by which the contents of bins and earth closets would be removed daily. The able city engineer had been for some time at work on two plans, one of the drainage as it existed, and one as it ought to exist. Within the next twelve months, perhaps in six months, a comprehensive scheme would be laid before the Corporation. He did not altogether agree with the remarks of the President in regard to the sanitary associations; he was a director of one.

Mr. W. H. Dunn seconded the motion, and spoke adversely of sanitary associations.

Mr. Connel supported the motion. He said that they ought not to be jealous of the sanitary associations, but ought rather to work hand in hand with them.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held on the 9th inst., Mr. David MacGibbon, president, in the chair. Mr. Walter Kirkwood read a paper on the timbers suitable for building and architectural purposes. The merits and demerits of those woods in general use were pointed out, and the necessity for the craftsman thoroughly understanding their nature and properties insisted on, in order that the good qualities of each might be ascertained and properly applied. The lecturer submitted for the consideration of architects whether it might not be of advantage to introduce in their designs some of the woods from India, Ceylon, South America, and other parts, the beauty of which was shown by specimens exhibited at the meeting. Mr. W. Walker, of Messrs. William Bryden & Son, read a short paper on practical bell-hanging, which he illustrated by working models and patterns. After indicating the usual form of specification prepared to suit the various necessities of domestic work, and explaining some of the technical terms, he detailed the usual methods of fitting up a villa or mansion-house, and enumerated the rules to be observed in good work, as well as the difficulties generally encountered. Some experiences were next related as to the best methods of detecting and preventing thieves and burglars getting access to houses, and a short statement was given of the advantages and disadvantages of the mechanical, pneumatic and electric systems. A short discussion followed the reading of the papers.

## THE FITZWILLIAM MUSEUM.

A MEETING of the Senate of Cambridge University was held on the 10th inst., when Dr. Porter, the late Vice-Chancellor, delivered a valedictory address. After referring to the new appointments, Dr. Porter said:—Against this long list of gains we must set the loss which the University has sustained by Professor Colvin's resignation of the office of director of the Fitzwilliam Museum, in consequence of his acceptance of the office of Keeper of the Prints at the British Museum. Under his direction the museum has been converted from a place of vague sight-seeing to a place of art education; the most important part of the collection of engravings, which now, with the additions of the Kerrich and University Library collections, stands easily second in England, and even takes a high place in the collections of Europe, has been catalogued, arranged, and mounted in the best way for purposes both of study and exhibition; a complete historical and descriptive catalogue of the pictures is now almost finished, and will be published in the course of the present year; the museum library has been supplied with as many publications, series of facsimiles, and other materials for study, as the limited funds permitted; and, lastly, a museum of classical archaeology and art sufficient for the needs of students in that department, and equal, I am informed on high authority, to any foreign collection of the kind except that of Berlin, has been built and almost fully equipped, and in little more than a month will be opened for use. Members of the Senate who have visited this museum cannot fail to be impressed by its remarkable adaptation for its purpose in all details of arrangements, and will heartily congratulate the architect, Mr. Basil Champneys, and Professor Colvin upon achieving a signal success. Dr. Porter then alluded to the visit of the Chancellor in last June, and expressed on behalf of the University its thanks to Mr. G. F. Watts for painting the artistic portrait of the Chancellor, and to Professor Jebb for the graceful inscription.

## LYCIAN ART.

IN the second of his course of lectures at University College on Lycian Art, Professor Newton began with a brief notice of the successive explorations of Lycia which have been carried on by various travellers since the year 1800. Early in this century the coast-line of Lycia was surveyed and for the first time correctly laid down by Sir F. Beaufort, and the late Mr. C. R. Cockerell accompanied him in his cruise, and was the first to discover and publish inscriptions in the Lycian language. The French traveller, Choiseul-Gouffier, and Dr. Clarke also visited the coast about the same time. The exploration of Lycia seems to have proceeded no further till 1836, when Texier, sent on a general mission to Asia Minor by the French Government, examined several cities. Then came the discovery of the monuments of Xanthus by Fellows in 1838, the tours of Lieutenant Hoskins and Schönborn, the English expedition to Xanthus, 1841, 1842, and the discovery of many new Lycian cities by Spratt and Forbes, whose excellent work on Lycia was published in 1847. A digest of all the information collected by travellers in Lycia is to be found in Ritter's "Erdkunde," vol. ix. With the exception of a few casts of rock sculptures, the monuments of art which were acquired by the British Museum in the expedition of 1841 are all from Xanthus. The later of these monuments are arranged in the Lycian Room, the earlier in the Archaic

Room. The most remarkable of the archaic monuments is that usually called the Harpy tomb, which was found in its original position near the theatre and a little below the Acropolis. This monument originally consisted of a rectangular block, weighing about eighty tons, and resting on a level base of rock. Above this was the frieze in relief now in the British Museum, the whole being surmounted by a capstone cut in steps. Inside the frieze was a small chamber, partly hollowed out of the rock, and partly enclosed by the four slabs of the frieze. On the western slab a small oblong aperture has been left, which is just large enough to admit a man's body. This monument corresponds remarkably in form with the tomb of Cyrus, which Strabo describes as a tower of no great size, solid below, but with a roofed chamber above, into which there was a very narrow entrance. On the inside of this chamber Sir C. Fellows found remains of Christian paintings and monograms, which led him to conjecture that it may at some time have been the habitation of some mediæval saint, and he supposes that the legend of Simon Stylites has reference to some such dwelling in a tomb. The subjects of the reliefs sculptured round the Harpy tomb have engaged the attention of several distinguished archaeologists ever since their first discovery, but no explanation commanding general assent has yet been offered. It is evident that the four scenes have a funeral import. This is shown by the four groups of harpies carrying off diminutive figures, which are probably the images of departed souls, and also by the symbol of the cow and calf over the door on the west face, and by offerings, such as the egg, the pomegranate fruit and flower, and the helmet which a warrior on the north side is offering to a seated male deity. The two female deities, who sit opposite each other, may be Demeter and Persephone, and the three figures moving to the right between them may be either the Horæ, the Graces, or some other mythical triad. The three seated male figures on the other side have never been identified. The date of the Harpy tomb is thought to range between B.C. 520 and B.C. 500, though it is possibly earlier than the taking of Xanthus by Cyrus, B.C. 540. The lecturer threw out a conjecture that this tomb may possibly be the Sarpedoneion mentioned by Appian in his account of the siege of Xanthus by Brutus. In that case the warrior offering his helmet on the north side might be Sarpedon himself. The lecturer concluded with a notice of some other archaic Lycian sculptures in the British Museum.

## SOCIETY OF ANTIQUARIES OF SCOTLAND.

A MEETING of this society was held on Monday, Dr. Arthur Mitchell, vice-president, in the chair. The first paper, which was read by Dr. Arthur Mitchell, in the absence of the author, was a notice of the Kilmichael-Glassary Bell Shrine, by Dr. Daniel Wilson, Principal of University College, Toronto. Among the valuable ecclesiastical relics which enrich the National Collection of the Society of Antiquaries of Scotland this beautiful bell-case or shrine claimed special attention, not only as a choice specimen of mediæval art, but as an illustration of the peculiarly Celtic practice of enshrining bells which were relics of their saints. It was accidentally discovered in 1814 in removing a heap of stones on the farm of Torrebhlaurn, in the parish of Kilmichael-Glassary, Argyllshire. The discovery of this interesting relic within an important Celtic area naturally suggested its being assignable to a Celtic origin and Celtic workmanship, and Dr. Joseph Anderson had suggested the possibility of its being identified as the bell of St. Molnay of Lismore, whose crozier is still preserved at Inverary Castle. The legend of the making of St. Molnay's Bell is told in the Aberdeen Breviary, but the bell-case or shrine in which this bell found at Kilmichael is enclosed is plainly of much later date than the bell itself. It is ornamented with interlacements and other designs characteristic of Celtic art, and of a transitional character, probably about the twelfth century, but its curious admixture of square and lozenge patterns, with flowing arabesques and interlaced ribbon patterns, add to the difficulty of assigning a specific date or school of art to this beautiful relic. The representation of the Crucifixion on the front of the shrine also presents peculiar features. After comparing it with the Crucifixion as represented on the Guthrie Bell Shrine, and on the Argyllshire crosses, Dr. Wilson proceeded to call attention to a curious feature in its ornamentation, which differs essentially from all others, and which is detached from all the others by its position above the Divine Hand placed over the head of the crucified figure. It bears a curious resemblance to an Arabic inscription, and on copies of it being sent to several Oriental scholars it was variously deciphered as one or other of the Mohammedan formulas of devotion. Other attempts at explaining the enigma suggested that it must be a representation of the cloven tongues or the Holy Spirit represented as a flame of fire; but for various reasons, which he discussed in detail, Dr. Wilson was led to reject all these suggestions, and to regard the mysterious device as simply a conventional method of representing the cloud from which the Divine Hand issues, as exemplified in many mediæval examples. His object in bringing the matter before the society was to recall attention to this beautiful old Scottish relic, with the view of determining

more precisely its date and the school of art to which it should be assigned. Sir Molyneux Nepean, who occupied the chair while Dr. Mitchell read the paper, expressed his concurrence with Dr. Wilson in the belief that the seeming inscription was not Arabic or any Eastern character, and pointed out that the little bell which the shrine enclosed was made exactly in the same way as he had seen sheep bells made in Brittany. On the motion of Professor Duns a cordial vote of thanks was given to Dr. Wilson for his paper on this interesting relic. The second paper was a notice by Sheriff Thoms of the bells of St. Giles and of the chapel of Holyrood, illustrated by rubbings from their inscriptions. After describing the bells in the tower of St. Giles, and illustrating their history from extracts from the Burgh Records, furnished by the town clerk, Sheriff Thoms referred to the transfer of the bells from the Royal chapel at Holyrood to the chapel in the Cowgate, and concluded by expressing the hope that this notice might be the means of eliciting more definite information regarding them. In the third paper the Rev. Hugh Macmillan, D.D., LL.D., gave an account of a considerable number of cup-marked stones which he had observed in the neighbourhood of Aberfeldy. In the last paper, Dr. Michael W. Taylor, of Hutton Hall, Penrith, described a pair of stone moulds for casting bronze spear-heads of very large size, which had been recently found in Cumberland. The moulds, with castings made from them, were exhibited, and Dr. Taylor presented facsimiles of the two halves of the mould to the museum. A statuette in terra-cotta from Tanagra was exhibited by Mr. J. R. Sibbald.

### LOW CEILINGS.

A "MEDICAL ANNUAL" has been published by Mr. Kimpton, which seems to be well adapted for the use of general practitioners. It includes some useful sanitary memoranda, one of which relates to low ceilings, a subject which has been lately treated by Mr. Honeyman. The writer in the "Annual" says:—The normal circuit of aerial movement in an inhabited room is this: The breath leaves the lungs at the temperature of 98° Fahr., and notwithstanding the high specific gravity of the carbonic acid which it carries with it, ascends towards the ceiling. The products generated by the combustion of light take the same direction, but more rapidly, by virtue of their much higher initial temperature. When these currents reach the ceiling they are deflected by it horizontally as they are continually displaced by successive supplies, and, rapidly cooling as they reach the walls, they there descend, to be again for the most part breathed and burned, but partially to escape by the chimney. Thus, without efficient ventilation, the air becomes more and more deteriorated. When the external air is much colder than the internal, these descending wall-currents passing down the inner faces of closed windows, become chilled, and fall in a cataract which is capable of producing all the effects of an open draught. From the foregoing it will be seen that little if any advantage accrues from the practice of making rooms lofty. The vitiated air does not remain in the upper regions, but in all cases certainly and speedily comes round to the floor. It is better (content for content) to have breadth than height; and, indeed, the moderate lowness of ceiling assists good ventilation, because the gases have the less time to part with their heat before they escape from the room.

### VALUATION OF PUBLIC SCHOOLS.

AN appeal from the Governors of the Royal Grammar School at Shrewsbury, against the assessment, has been heard at the Borough Quarter Sessions. In July 1882, the rate appealed against was made on a gross estimated rateable value of the Grammar School at 780*l.*, and the head-master's house at 65*l.* The Governing Body went to the Assessment Committee and objected to the assessment, and on October 6 last—after five meetings—the committee reduced the valuation. They lumped the school and head-master's house together, and put down the gross value at 1,300*l.*, and the rateable value at 1,137*l.* 10*s.* The contention of the appellants was that the valuation was still too high. The following evidence was given, as reported in the *Shrewsbury Chronicle*:—

Mr. Richard Fowler said: I am a surveyor, practising in Birmingham, and have had more than forty years' experience in rating questions. I have valued parishes for the purposes of rating, and I have been for a good many years chairman of the Assessment Committee of Aston Union, which has a population of 160,000 or 170,000. I have made a valuation of Shrewsbury School and the head-master's house, with the view of arriving at the rent a tenant would give for them, supposing they were let. I have taken first the school building itself, and this I put at 370*l.* gross estimated rental. I put the head-master's house at 350*l.* The next item was the gas-engine, the engine-house, and the well. It is a deep well, to supply the school and masters' houses, and this I put at 70*l.* Then on the land is a shed, which the boys use for shelter when it is wet, and there is a

little shop adjoining, where they sell cakes, lollypops, and oranges. This I put at 10*l.* There is 18 acres of grass land, which I put at 5*l.* per acre, and the total gross rental is 890*l.* I have valued the premises on the same principle as I usually do. I have taken a general view of the extent and the character of the building, and the purpose for which it was to be applied, and then I have taken the buildings separately and ascertained the superficial area of each building, and have placed upon it such a price for the area as leads me to think would be a fair estimate of property of that description. Then I reconsider the result as a whole, and see if it commends itself to my judgment as a fair result. If it does I adopt it, and if not I modify it somewhat.—Cross-examined: I have only one principle that I go upon in making a valuation. I made no calculation as to the sweetshop and shed—it was not worth while. You cannot value a well and such things in exactly the same way as you would a house and school. Perhaps the structural value of these two buildings would be about 9,000*l.* each.—Re-examined: There is a difference between structural value and structural cost. The "value" is what it would sell at, and not what the building cost. The cost of construction has nothing to do with assessment. There has been a great deal of money spent that will never come back in the way of rent. There has been money spent there for ornament and so on that cannot be included in the rent. It has been built as an ornament to the town and a credit to the Governing Body.—To the Recorder: I know of no other way of valuing property such as this. I have never let such a school and buildings as these. If a proposed tenant wanted the school and house, and the rent fixed was too high, he would no doubt build for himself; but if he did do so, he would not expend more money than what was needed for his purposes; but in this case more money had been so spent, and he thought very wisely, to make the school as attractive as possible. A building which would have answered all the commercial purposes might have been erected for a very much less sum than the present buildings cost. When there was no tangible principle to go upon, I take the structural cost, and this is done in the case of the well. I believe the principle of taking the squares of the property is a correct one. It is the one adopted by most valuers. Some take the yard cube, and some the yard superficial, but it is the same thing in the end.

Mr. Henry Burd: I am a land agent and surveyor in this borough, and have been in practice upwards of thirty years. I have had considerable experience in valuing for rating, and also for letting purposes. I have inspected the new school-house and head-master's house on Kingsland. I valued quite independently of Mr. Fowler. My total is 937*l.* 10*s.*, and in arriving at that (the gross annual value) I have endeavoured to put myself in the position of being called in by the landlord to give what is a fair and full value of the property. First of all, I have taken the head-master's house, and have calculated the structural value of all essentials at 10,000*l.*, which I have capitalised at four per cent. That gave a gross annual value of 400*l.* Then I came to the school buildings. I have applied the same principle, and the gross sum is 9,000*l.*, and the gross value 360*l.* I have applied the same principle to the shop and building, which gives 11*l.* 10*s.* The land I put at 90*l.* Then I took the gas-engine at 60*l.* a year, but inasmuch as it supplies the water for the other two houses, I have taken credit for 30*l.*, which leaves 30*l.* gross on that. Then there are special hot water supplies, which have cost about 900*l.*, and upon this I have charged 5 per cent., which ought to make 937*l.* 10*s.* I have taken the cost of construction of what was really essential. In getting at the capital cost I cubed up the building, and so made my calculation as to the gross annual value. I believe that the 10,000*l.* and the 9,000*l.* contain in them everything that is necessary for a school and schoolmaster's house. The amount I estimated is the most the landlord could get.—Cross-examined: I do not deduct anything from the gross to get at the net value. There is a general scale for that. I cannot give the actual cost of the buildings. I dare say it is 30 per cent. more than my structural value. I do not think a man could get more than 4 per cent. upon the 10,000*l.*, which would purchase all the essentials. Looking at it from a landlord's point of view, you cannot get more than 4 per cent. on the 10,000*l.* The master's house is expensively built, from the way in which the elevation is broken up. Pitch pine is used; the front is all pressed brick, and pointed, and all the half brickwork is built in cement. The work is most expensively done throughout. I believe the head-master's house cost about 13,000*l.*; but to supply all the essentials 10,000*l.* would, I say, be sufficient. The 13,000*l.* was more than was sufficient. I have put with the house 1½ acres of ground. I have included for the land in the 10,000*l.*, or, rather, in the annual value which I have fixed. The 10,000*l.* for essentials does not include the land. The landlord may want extra rent for the land, but he would not get it. I cannot tell the exact cost of the school itself. I do not know that 13,147*l.* was spent on that building after the purchase. I have gone on the same principle in regard to the school as the head-master's house.

Mr. Richard Clarke, Birmingham, said: I am borough valuer for Birmingham, and also surveyor for several unions, and have during my experience valued several parishes for rating. I put the gross on the head-master's house at 341*l.*, and the school

buildings at 364 $\frac{1}{2}$ l., the engine-house and well at 55 $\frac{1}{2}$ l., and the engine at 5 $\frac{1}{2}$ l., the pavilion and shop at 15 $\frac{1}{2}$ l., and the land at 100 $\frac{1}{2}$ l. a year. The total is 880 $\frac{1}{2}$ l.—the gross estimated annual value.—Cross-examined: I have taken the master's house at 8,525 $\frac{1}{2}$ l. It could have been built for this to give the accommodation it does. The witness here explained how he made his calculation by means of "squares." The building was put up, he should think, more to please the architect than for the use of the boys, at least it could have been erected for less cost, and yet so as to afford all the accommodation. I have dealt with the school on the same principle.—Cross-examined: I have taken 4 per cent. on the master's house and schools, and 5 on the engine-house and well. I have taken that on the cost, or what I say should be the cost.—To Mr. Hill: I have had some experience in rating schools in Birmingham and other places, and I have adopted the same principle before.

Mr. Henry Hurle Treasure said: I am an architect, surveyor, and building contractor at Shrewsbury. I built the head-master's house, and carried out the alterations at the school itself. I have read the evidence given by Mr. Henry Burd, as to what the work might have been done for to meet all essential requirements and in the ordinary style of building, and I agree with him. I mean if the buildings had been erected in a plain and ordinary style, which they are not. The lead is not absolutely necessary on the roof; and a lead roof, besides the extra cost of the lead, requires stronger timbers.—To Mr. Young: The head-master's house cost 14,436 $\frac{1}{2}$ l., and the school 10,700 $\frac{1}{2}$ l. I believe those were the figures, but I have not got them by me. Including drainage, &c., the total cost of the two was 26,369 $\frac{1}{2}$ l. I do not think it was any saving to utilise the old buildings. The walls were exceptionally strong, and then you have done with the usefulness of the old buildings. If there had been no buildings there at all I believe we could have erected the school quite as cheaply as it was done.—To Mr. Hill: The school floor is of pitch-pine, and red deal would have been sufficient, but would not last so long. Red deal is used in all the Board schools of the town.

The further hearing of the case was adjourned to February 1.

#### A CLERK OF WORKS' AWARD.

A CURIOUS case has just been heard by Mr. C. G. Merewether, Q.C., which has lasted for fourteen days. The action was brought in the High Court of Justice by the plaintiffs, Messrs. Towle, Goulding & Marshall, who carry on business at the Sheepcote Hurdle and Iron Works, Birmingham, against the defendant, who resides at Colney Park, Herts, to recover the price of 3 $\frac{1}{2}$  miles of unclimbable hurdles and an iron-framed building, for breach of two contracts, to have two awards of the clerk of works set aside, and for relief on both contracts. The defendant counterclaimed for 1,000 $\frac{1}{2}$ l. damages for breaches of contract and damage to crops.

In December 1882, the plaintiffs were waited upon by Mr. William Gunn, who represented himself to be a civil engineer acting for the defendant, and they signed a contract prepared by him to make three miles of unclimbable hurdles of "best Staffordshire iron," with gates and tree-guards, and to fix them at Colney Park within a specified time under the superintendence of Gunn, as clerk of works; the price to be 9 $\frac{1}{2}$ l. 10s. per ton. They also signed another contract to make and erect an iron shed 162 feet long for 630 $\frac{1}{2}$ l., the defendant to provide the brick and stone work foundations according to the drawings and specifications. Both contracts contained a clause "that in case of any difficulty or dispute, the award and decision of the clerk of works should be final." When about 2 $\frac{1}{2}$  miles of the fencing had been fixed, Gunn gave orders for an additional half mile beyond the contract, to be made and fixed at the contract rate. The plaintiffs completed the fencing, and the clerk of works then refused to certify the completion, but gave an award without a previous hearing of the parties, whereby it was attempted to deprive the plaintiffs of the benefit of their contract. The iron shed was not completed in consequence of the defendant neglecting to have the necessary brick and stone foundations prepared, and although the plaintiffs had ready on the site the materials and apparatus for the shed, and made applications for the defendant and clerk of works to get the foundation ready, the clerk of works, without previously hearing the parties, made an award putting an end to the contract and throwing the shed material on the plaintiffs' hands. The plaintiffs refused to acknowledge the award, and commenced legal proceedings. When both the awards had been made the plaintiffs discovered that the clerk of works was a weekly servant of the defendant, receiving weekly wages; was formerly a carpenter at Belfast, and knew comparatively nothing about the work which he was supposed to superintend. The defence set up was that the works had not been performed within the specified time; that the fencing was loosely fixed and insufficiently painted, and that the whole would have to be taken up and refixed. Claim was also made in respect of damage alleged to have been done to the hedges and crops; and as to both contracts it was contended that the plaintiffs were barred by the awards of the clerk of the works. It was proved, however, that the fencing was made and painted according to

sample; and fixed, as well as the newly-made ground and hedge-roots would permit, in the line pointed out by the clerk of works. A large number of witnesses were called on both sides, amongst them being several noted iron manufacturers from Staffordshire, to prove the meaning of the term "best Staffordshire" iron, and the quality of the work done; and Mr. W. Phipson, surveyor, gave evidence touching the technical and working details of both contracts, and with respect to the drawings and specifications. The arbitrator gave his award on Monday for the plaintiffs for 1,025 $\frac{1}{2}$ l., with costs, and against the defendant on the counterclaim.

#### DEFECTIVE PLUMBING.

A CASE was heard on Monday in Glasgow, before Sheriff Murray, which arose from a defective drain. The pursuer, Mr. Wm. Robertson, sued Mr. John Neilson, builder, for 12 $\frac{1}{2}$ l. The defender was, in September 1877, employed to alter the drains in pursuer's house. The summons stated that "the work was done in a defective, insufficient, and untradesmanlike manner, in consequence of which obnoxious gases were emitted to the danger of life and health." Pursuer estimated that he had suffered loss to the extent of 30 $\frac{1}{2}$ l., including outlays of 17 $\frac{1}{2}$ l. 8s. incurred in remedying these defects. It was not till May 1883, the work being below ground, that the defects were discovered. The damage was restricted to 12 $\frac{1}{2}$ l. Mr. Robertson having spoken to the contract and to being annoyed with smells for some time in the house, Mr. Gilbert Thomson, engineer for the Glasgow Sanitary Protection Society, was examined as a witness. He stated that in May 1883 he was asked to make an examination of the drains in Mr. Robertson's house, and his opinion was that the pipes had not been properly cemented. Mr. Miller, C.E., said he examined the drains in Mr. Robertson's house. He found that they had been badly laid and badly jointed. For the defence, a witness stated that he assisted to lay the pipes, and that the work had been done in a tradesmanlike manner. He had had twenty years' experience in laying drains. The drains were properly cemented and fixed up. Mr. Neilson, the defender, said he got special instructions to carry the pipes through the house. He did not allow any broken pipes to be used, and the work was executed in a substantial manner. The details connected with the jointing were all properly attended to. From 1877 till 1883 he had heard no complaint, and the pipes had been taken out without his having seen them. His Lordship said that the considerable lapse of time was a presumption in favour of the defender, because he could not at that distance of time bring such evidence as he might have been able to do had the work been recently executed. Another presumption in his favour was his being absent when the pipes were inspected, and it would have been advisable if he had received notice to be present at the opening of the drain. Keeping these facts in view, the Sheriff said he had strong hesitation in giving judgment against defender. Other circumstances, however, which came to light in the course of the evidence proved that there were original defects in the laying of the pipes; and as the present action was simply for compensation for putting right what was originally defective, he found the pursuer entitled to the sum claimed, viz., 12 $\frac{1}{2}$ l.

#### CELTIC AND ROMAN BRITAIN.

AN interesting lecture on this subject was delivered last week before a crowded theatre at the London Institution by Mr. Alfred Tylor, F.G.S. It was illustrated by numerous drawings of remarkable antiquities. Some of them bore Eastern symbols, others were purely Roman in character, others again of British origin. Besides a number from Lydney, they mostly belonged to the Roman remains beneath Warwick Square, explored by the lecturer himself, or to the magnificent Roman villa with its appendages which have been so thoroughly excavated during the last years near Brading by the Messrs. Price. It was pointed out that these Roman remains illustrate the little-known rites of the Persian sun-god Mithra, whose mysteries were introduced into Italy about the beginning of the Christian era. In like manner the sacred symbolic cross called the Svastika appeared on a Roman tessellated pavement, and was compared with the same Vedic emblem found by Dr. Schliemann so often recurring in all the pre-historic strata representing so many successive cities which in their turn stood on the site of Troy. The paddles of the British coracle, or small boat made of skin stretched on wickerwork, were seen, in shape like a pickaxe, on a bronze of the Roman period found at Lydney. The type corresponded with one met with in Persia. The coracles themselves, the lecturer observed, were new to the early Greek navigators in British waters, such as Pytheas, of Marseilles, and excited their admiration; for the ancient Britons went as far as the Scilly Islands in boats which could be carried on a man's shoulders. At Lydney, moreover, there were dedicatory inscriptions in honour of a British god styled by the Roman colonists Deus Nodens—the god of the deep; and probably the temple at Brading, in the Isle of Wight, may have been consecrated to his worship. On one of the antiques exhibited was a man clad in

*bracca*, or breeches, forming the same sort of contrast, as compared with the *gens togata*—the Romans as wearers of the *toga*—that a Highlander does to a Lowlander, or a British grenadier to an Indian sepoy. Mr. Tylor had prepared with great care a map of all the Roman roads which are still in use as great trade highways at the present time, and he pointed out how large a number of them converged at Winchester (*Venta Belgarum*), which was evidently used as a central *entrepôt* for conveying the metallurgical products of Britain to the Continent. So many British sepulchral mounds were to be found on some of these routes that they must have been chariot or horse routes centuries before the Roman occupation of our island. Then from Winchester the tin, iron, and lead from Cornwall and Wales could be carried to Beaulieu; thence eight miles to Stans-ore Point—a name etymologically connected with the word *stannum*, tin—to the shores of the Solent. This point was but a couple of miles from Gurnards Bay, in the Isle of Wight, whence there was an easy road to Brading, a very safe port. Passing to another triumph of early Celtic culture, the lecturer remarked that one great division of the race, the Irish, invented the Ogham script, a most original and ingenious system of writing. It used short straight strokes, counting from one to five, the number of the fingers on one hand, intersecting perpendicularly a long horizontal line. There were thus equivalents for five letters of an alphabet. Other lines, still perpendicular but above the horizontal, gave the notation for five more, or, with the simple change of writing the short uprights below, there were ten more. To complete the Celtic score, the short right lines were again written across the horizontal, but this time slanting. Thus was formed an alphabet of twenty letters, the respective powers of which have been verified by means of bilingual inscriptions. This achievement of the Celtic race corresponded with the high metallurgical and artistic skill shown in their extremely ancient jewellery. Ogham inscriptions were found nowhere outside the British Isles.

#### ROYAL ACADEMY.

THE following students have been admitted to the Architectural School:—

*Upper School*.—A. Howse, A. Kent, E. S. Norton.

*Lower School*.—L. Ambler, C. S. Appleton, W. H. Bidlake, F. Brown, E. A. Coxhead, H. W. Crickmay, A. Dovaston, W. J. W. Ferguson, P. Figgis, H. R. Goodrham, F. C. Hart, J. Lord, F. S. Ogilvie, E. W. Pickford, T. B. Rutherford, H. D. Walton, R. W. Williams.

*Probationers*.—C. J. L. Hall, A. B. Mitchell, J. E. Newberry, E. H. Sedding, E. H. Selby, J. A. Van Straaten, F. W. Troup.

#### Hampton Court.

SIR,—My attention has just been drawn to a picturesque "bit" of Hampton Court Palace, shown in your paper for December 29. The picture is beautiful, but, unfortunately, the chimney is modern. A native of the old palace, I can safely say that there is not one single *old* chimney-shaft left of Wolsey's time, all having been "restored" (?) within the last forty years. It is satisfactory to be able to say the work in most cases has been well done.

I am, Sir, yours faithfully,

HENRY E. JOHNSON.

Fairfield South, Kingston-on-Thames:  
January 15, 1884.

#### Construction of Silos.

SIR,—The kind of silo that was proposed to be constructed in last week's *Architect* would answer well if sufficient precautions were taken. But if, as seems probable from his note, "B" is an amateur, I advise him to call in a builder to carry out that part at least of the work in which Portland cement is used. The period of two months allowed for the setting appears to be unnecessarily long, unless there are local conditions which have not been described. As "B" evidently has some misgivings about the damp of the place, I should recommend him to use asphalt over the concrete as a lining, if expense is not a consideration. But this material is more difficult to deal with than concrete, and experience in its use is requisite. In ordinary situations a pit with a cement floor and sides of hard brick set in cement, and, if necessary, coated with cement, is quite safe. I may also say that "B" will do well to be careful with that part of his silo where the brick joins the concrete, so as to seal the junction against water, and the better plan would be to bring the brick walls down to below the floor level.

Yours obediently,

A BUILDER.

#### CHURCH BUILDING AND RESTORATION.

**Dewsbury.**—The parish church at Dewsbury is to be restored and enlarged under the direction of Mr. A. E. Street, M.A., and Mr. A. H. Kirk, of Dewsbury. The building fund now amounts to 5,000*l.*, and it is proposed to begin the work. The portions of the existing structure to be retained are the nave, with the arcading north and south, and the lower portion of the tower. The new works will include double transepts north and south, chancel, with an aisle on the north side, and an organ chamber on the south (a feature which the church has not hitherto possessed), a clergy vestry and a choir vestry, two entrances on the north side and one on the south. The extension eastwards is the most important part of the project. The new chancel will be 45 feet by 23 feet, in contrast to 26 feet by 17 feet, the dimensions of the old one. The area of the church will thus be double what it is at present, and the accommodation increased to 1,087. The galleries will be removed, and oak stalls substituted for the old-fashioned pews. The stage to be added to the tower, which will contain a bell-chamber, will raise the structure to a height of about 90 feet. The entrance through the tower will be improved, and the ugly windows on the north and south sides of the nave taken out, and replaced by tracery windows of a character in keeping with the other new portions. The roof will be replaced by a new one, and covered with lead. It is intended that the works shall be carried out in sections, so that certain portions of the building may still be used for holding services.

**Hanley.**—The Presbyterians of Hanley are about to pull down their present place of worship, and replace it by a more modern edifice, in consequence of a fire having partly destroyed the interior of the building some short time back. For that object architects have been invited to send in designs for the new building, and the committee have selected the design sent in by Mr. G. W. Bradford, of Miles Bank Chambers, Hanley, and appointed him their architect for the new building. The new church will be of a plain Gothic character, and will consist of nave, with aisles at each side; tower at the west end, two transepts, minister's and deacons' vestry, and gallery at one end, accommodation being provided for 500 persons.

**Mautby, Norfolk.**—The parish church of Mautby, near Great Yarmouth, was on the 10th inst. reopened, after restoration under the superintendence of Mr. A. S. Hewitt, A.R.I.B.A., 10 Regent Street, Yarmouth. When the south aisle was destroyed the arcade was blocked up; this has now been opened out and a new wall built outside the arcade and new windows put in. The roof has been re-thatched and boarded inside, open benches provided instead of the square pews, and the fabric generally restored. The remains of some old stained glass have been carefully preserved. All the works have been satisfactorily carried out by Mr. G. E. Hawes, of Norwich.

#### SCHOOL BUILDINGS.

**Glasgow.**—Two additional Board schools have been opened by Mr. Mundella. The Shields Road school was designed by Mr. J. L. Cowan, and provides accommodation for 850 children, the area being 10 square feet for the older scholars and 8 square feet for infants. The cost of the building was 9,387*l.* 11*s.*, or 10*l.* 15*s.* 8*d.* per scholar. Including site and legal expenses, the cost per scholar was 16*l.* 19*s.* 7*d.* The St. George's Road school was designed by Mr. T. L. Watson, and provides for 1,048 scholars, 10 square feet being allowed for the older scholars, and 8 square feet for infants. The building cost 10,827*l.* 8*s.* 6*d.*, or 10*l.* 6*s.* 7*d.* per scholar. Including site, the cost was 16*l.* 13*s.* 7*d.* per scholar. The St. George's Road is the thirty-third school erected by the Glasgow School Board.

**Northampton.**—The eighty-one designs sent in for the new Board schools in Military Road having been submitted to Professor T. Roger Smith, two bearing the signatures "N" and "Plan" have been selected. Both were submitted by Messrs. W. Talbot Brown and Charles Dorman, joint architects, of Wellingborough and Northampton. Of the whole number of designs, twenty-one, bearing the following mottoes, obtained five-sixths of the full number of marks:—"Whiston," "Perseverantia," "N," "Christmas," "Croquis," "Lux" (a), "Plan," "Straightforward," "Labour omnia vincit," "Nothing like leather," "52," "Experience," "Simplex," "Practical Utility," "Knowledge is power," "Measure for measure," "Light, air, and economy," "Advancement," "Ipsissima," "Late," and "Study." The final selection was between "Light, air, and economy," "Straightforward," "Lux" (a), "Measure for measure," "Plan," and "N," the two latter being ultimately chosen, of which "N" has been decided upon by the members of the Board. In the design marked "N" the main front faces the street, with the boys' entrance at the north-west corner, and the doors for girls and infants at the opposite end. In the boys' department four class-rooms are provided, and a room sufficiently large to accommodate two classes, a sliding glass partition being arranged in the centre for the purpose of dividing the classes. The divisions between the large room and the class-rooms are

proposed to be partly glazed, by which means the head-master would be enabled to overlook the whole of the class-rooms when at his desk. The girls' department is provided with three class-rooms only, but in other respects the arrangements are exactly the same as in the boys' division. In the infants' department four class-rooms, a babies' room, and a large apartment are provided, all arranged so as to be under the supervision of the head-mistress. Every room has windows on two sides, and some on three, while ventilation is secured by means of upright shafts, sashes made to open, openings in the centre of the ceilings, and Boyle's ventilators placed in the turrets. Steam is suggested for heating purposes. The walls are proposed to be of local bricks, with Bath stone dressings to doors and windows. The roofs to be covered with green slates and red ridge tiles, the whole of the rooms to have boarded dados, the floors to be covered with wood blocks, and the playgrounds to be asphalted. The estimated cost is 8,700*l*. The estimated cost of carrying out the other four designs which met with the approbation of Professor Smith was as follows:— "Straightforward," 8*l*. per child; "Light, air, and economy," 9,185*l*.; "Measure for measure," 8,025*l*.; "Lux," 8,800*l*.

## LEGAL.

### Court of Queen's Bench.

(Before Mr. WM. BOTTERILL, Arbitrator.)

OATES *v*. SCALES.

ARBITRATION CASE.

This was an action on the part of a sub-contractor, Mr. James Oates, a builder at Scarborough (involving the measurement of upwards of 5,000*l*. worth of work), for 2,000*l*., the balance of his contract in executing the excavators', bricklayers', masons', and plasterers' work in the erection of new premises, Scarborough, for Messrs. William Rowntree & Sons, brought against Mr. George Scales, the contractor of the said building. The building had been altered at various times during the erection, and the defendant had employed Mr. Wm. Thornicroft, surveyor, of London, to measure up and value the plaintiff's work, and according to such valuation the defendant had already paid plaintiff 2*l*. 8*s*. 2*d*. more than was due to him. By order of the Court the plaintiff was required to furnish particulars of his claim. He then employed Mr. William Hoffman Wood, of Leeds, surveyor, to measure up his work, which was measured and valued and a balance certified him to be due to the plaintiff of 859*l*. 12*s*. 9*d*., and 107*l*. 18*s*. 10*d*. cost of measuring, on which total sum of 967*l*. 11*s*. 7*d*. the plaintiff then sued. Several witnesses were called to prove the different meaning of technical terms in Scarborough and Yorkshire to the same terms as understood in London. In his evidence the plaintiff admitted that a sum of 113*l*. 5*s*. for commission for quantities, included in the sum of 859*l*. 12*s*. 9*d*., had not been paid by him to the defendant or the architect, and this sum was deducted from the plaintiff's claim, which left a balance of 746*l*. 8*s*. 9*d*. claimed by plaintiff. During the evidence, which occupied two or three weeks, the arbitrator, Mr. Botterill, remeasured the whole of the premises with Mr. Thornicroft and Mr. Hoffman Wood, and he gave his award on Monday for the plaintiff for 699*l*. 17*s*. 2*d*., with all costs.

Another claim by the same plaintiff against Messrs. Rowntree & Sons, the owners of the premises, for 93*l*. 11*s*. 2*d*., for days' work, was awarded to the plaintiff with costs.

## GENERAL.

**The Seventh Annual Exhibition** of the Manchester Graphic Club has been opened. Nearly 200 pictures have been contributed by about twenty artists.

**Mr. Ford Madox Brown's** picture—*Work*—has recently passed into the hands of Mr. Benjamin Armitage, of Sorrel Bank, Manchester.

**Mr. Woolner, R.A.**, is engaged on a model of a statue of the late Sir Arthur Kennedy.

**Mr. Burne Jones** is to design the window for St. Philip's Church, Birmingham, which is to be placed in the new chancel. The subject chosen is *The Ascension*.

**Lady Sykes** has presented a chasuble and dalmatics, worth 200 guineas, to St. Wilfrid's Catholic Church, York. The embroidery is ancient Italian work beautifully designed.

**The Loan Exhibition** organised by the Leicester School of Art for the purpose of clearing off their debt promises to be a success. Amongst the works in oil are examples of Sir Edwin Landseer, R.A., Clarkson Stanfield, R.A., Richard Wilson, R.A., Sir A. W. Callcott, R.A., J. W. Oates, A.R.A., B. W. Leader, A.R.A., Morland, Vincent, Nieman, Cole, Henry Dawson, Garland, &c.; and in water-colours David Cox, W. Hunt, Cattermole, G. Barrett, Holland, Cotman, De Wint, Linton, Prout, Varley, and others.

**A Committee** is to be appointed for the purpose of inquiring into the question of railways and other public works in India.

**Miss Barlow**, of Leicester, has given the sum of 8,000*l*. for the building of a church in the Knighton district, a suburb of the town. Messrs. Goddard & Paget, of Leicester, are preparing the plans.

**An Exhibition of Derbyshire Marbles** is to be held at Matlock Bath during the summer.

**Mr. J. Carrick** has been instructed to prepare plans for a block of artisans' model dwellings in Moncur Street, Calton, Glasgow, which will be erected by the Corporation.

**An English Church** will be erected in Copenhagen if sufficient funds are provided. The residents, after several years' exertion, have collected 670*l*., and the donations recently received have raised the amount to 2,666*l*. It is proposed to erect a church capable of holding about 250 persons, at an estimated cost of 5,000*l*. to 6,000*l*.

**Bewick's House**, in Gateshead, has been sold by auction. It was purchased by the wood-engraver in 1814, and he occupied it until his death, in 1828. The house was purchased for 850*l*.

**The Old City of London School** in Milk Street, Cheapside, has been secured for the City Constitutional Club, which is now being established. The building was sold for 60,000*l*. some months back.

**A Design** for the proposed lunatic asylum for the borough of Derby will shortly be sought by competition. The cost of the building will be about 30,000*l*.

**Mont St. Michel**, being exposed to danger from the dyke constructed round it in 1879, an interpellation has been submitted by M. Antonin Proust. Victor Hugo has announced that "Mont St. Michel is for France what the Great Pyramid is for Egypt. It must be preserved from all mutilation. Mont St. Michel must remain an island. This double work of nature and art must be preserved at all cost."

**St. Cuthbert's Church**, Darlington, is to be reseeded in oak at a cost of about 850*l*.

**An old Rubble Wall**, supposed to be part of the Roman wall from which Wallsend obtained its name, has been found in that town at a depth of five feet, in some excavations for building purposes.

**The Gloucester Cathedral Society** met on Tuesday night in the chapter-house of the cathedral, when papers were read by Rev. S. E. Bartleet, on "Bromfield Priory," near Ludlow, a dependent of Gloucester Abbey; by Mr. Gambier Parry, on "Ancient Painted Glass in the Cathedral"; by Mr. Waller, on "Examples of the Different Styles of Architecture in the Cathedral"; and by Mr. J. J. Powell, Q.C., on "The Election of a Boy Bishop, A.D. 1558," the last occasion on which a boy bishop was elected for Gloucester Cathedral.

**The Cockburn Association**, Edinburgh, proposes memorialising the Government on the subject of Edinburgh Castle, and the restoration of the ancient "Aula Castri," or Parliament House, and other ancient and historical parts of the castle.

**A Tunnel** under the river Forth, at Kincardine, over a mile in length, is included in one of the railway schemes to be submitted to Parliament.

**Mr. Nicholson**, diocesan architect, has been requested to prepare an estimate of the cost of restoring St. Peter's Church, Hereford, for which several sums of money have already been given.

**The Metropolitan Board of Works** have approved of a recommendation that notices should be served on the owners of the Princess's and St. James's Theatres requiring them to make extensive alterations to remedy the structural defects of the buildings.

**A Difference** has arisen between the Birmingham master builders and stonemasons upon the question of wages. In accordance with a resolution passed at a meeting of the stonemasons' trade union, the secretary of that organisation gave notice to the secretary of the Master Builders' Association for an increase of a halfpenny per hour, to take effect from April 1 next. A reply was received to the effect that the employers would require a reduction of a farthing per hour after the date mentioned.

**A Company** has been formed in Glasgow "for the purpose of supplying additional cemetery accommodation," principally for the central, northern, and eastern parts of the city. It is proposed to purchase about 92 acres of land at Letham Hill as a site. Mr. W. F. Salmon is architect to the company.

**A Small Chamber** has been discovered at Wegbar, near Carnforth, in the quarries belonging to the Earl of Crawford and Balcarres. Among the antiquities found in it are a large perforated stone hammer, beautifully formed, and a stone quern for grinding corn; a bronze celt or axe head of the ordinary type, 5½ inches long and 3 inches broad at the cutting edge; a fine socketed spear head, 9 inches long and 5 inches wide at the broadest part; a portion of a bronze sword, 8½ inches long and 1¼ inches broad; a fine axe head of iron, 6½ inches long and 6¾ inches broad at the cutting edge; and a spinning-wheel 6 inches in diameter.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 19, 1884.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### APPOINTMENT VACANT.

CHELMSFORD.—Jan. 25.—Applications are required by the Chelmsford Rural Sanitary Authority for the Appointment of a District Surveyor. Salary 250l. per annum. Applications are also required for the Appointment of an Assistant Surveyor for the District. Salary 200l. per annum. Mr. W. W. Duffield, Clerk to the Rural Sanitary Authority, 96 High Street, Chelmsford.

### COMPETITIONS OPEN.

ABERDEEN.—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

BLOEMFONTEIN.—Mar. 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

CAPE TOWN.—Jan. 30.—The Town Council of the City of Cape Town invite Plans and Specifications, accompanied with approximate estimate of cost, of a System of Drainage. Selected Plans and Specifications to become the absolute property of the Corporation. All others will be returned free of expense. Premium of 250l. A plan of the City, with levels, may be seen, and further information may be obtained, on application to the South African Loan, Mortgage, and Mercantile Agency, 9 King William Street, London, E.C.

LEICESTER.—March 1.—Designs are invited for a Block of Buildings proposed to be erected on the South Side of New Entrance to the Market Place. Premiums of £25 and £15. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

LONDON.—March 1.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

ST. PANCRAS.—Feb. 1.—Designs are invited for Buildings for Mortuary and Coroner's Court. Mr. T. Eccleston Gibb, Vestry Clerk, Vestry Hall, St. Pancras Road, N.W.

UXBRIDGE.—Jan. 31.—For System of Sewerage and Sewage Disposal. Mr. Charles Woodbridge, Clerk to the Rural Sanitary Authority, Uxbridge.

WALMER.—Jan. 21.—Designs are invited for Laying Out the Estate of St. Clare for Building Purposes. Messrs. W. & T. Denny, Walmer.

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

## PUBLIC OPINION UPON ARCHITECTURE.

IF we were asked to give a definition of the term, "the architectural profession," perhaps it would be most convenient, in England and amongst English associations, to say that it is made up of those persons whose business is the design and supervision of the housebuilding that goes on. Of course this language has itself to be defined; but it is enough for our present purpose to say that the word "housebuilding" must be taken in a sufficiently wide sense, and that "design" also has to be interpreted freely. A cathedral may easily be regarded as a house within the meaning of the definition, but so must an Albert Memorial or a Nelson Column; while the design of the edifice must be taken to include in all respects both its construction and its appearance. But after all it is the word "supervision" which is probably the most important as regards the particular views of English people; and, if we say "direction" instead, and thus call an architect a *director* of building, the very vagueness of the term, and even its commercial associations, if so regarded, seem to convey all the better the vernacular idea of design of every kind, combined with supervision of every kind, which an essentially commercial people may be understood to entertain. The function of an architect, that is to say, is to take upon himself the whole direction of a building transaction, and to carry it through in a thoroughly expert and businesslike way.

Now, it is often said that English public opinion goes very much against English architects. This, we may at once reply, is not correct as matter of fact. The English public, as a rule, are found to be quite satisfied with their architects. In other words, an average Englishman, in contemplating an average building, is generally satisfied with the way in which his wishes have been carried out by an average architect. But then we shall be told to look at the work which is above the average, and far above it; and to regard also that kind of Englishman who is in the same way a superior person. The proposition here implied is that the cultivated Englishman is in advance of the cultivated English architect; and now we have generally to confine our attention to an æsthetic view of the question. For architectural design, in any work of importance well done, has always professed to be artistic design, and what we are now called upon to answer is the charge that the best of our artistic work in building is deemed unsatisfactory by the higher public opinion of the nation, or that architectural art in England is behind the architectural criticism of people of culture in England.

Allowing for the effect of travel, no doubt we are bound to admit that Englishmen of the best natural taste must be led to draw intelligent comparisons between the chief public and private edifices at home and their counterparts abroad, and to feel that certain foreign cities are in advance of English cities in various points of architectural treatment. The French in particular, but the Germans and the Italians also in their degree, seem to understand and appreciate the *architecturesque* far more than we do. Not only the *mise en scène* of the streets, but the management of the individual factors in the grouping and disposition, and not only the *ensemble* of any one of those factors, but the whole administration of its features of detail, produce upon the mind of the beholder an impression of technical adroitness compared with which the effect of similar productions in England is both rude and crude. We must expect, therefore, to find, as the result of the Continental travel now so universally indulged in by people of the better class in England, a certain dissatisfaction with English architecture; and they who have at heart the progress of architectural design may be glad to find it so, and in every way disposed to encourage a discontent which promises to provoke improvement on such grounds.

But it would be a mistake to suppose that this puts the question in a practical form. We are inclined to think it is not as the result of comparison with foreign superiority that

any serious quarrel exists between English architects and the public. It is those classes of people who derive their critical principles from within rather than without who just now seem to make a complaint. It is not the study of highly-advanced examples that they proceed upon, but the supposed discovery of first principles by means of their own consciousness. Mr. RUSKIN is a typical example. He generalises, no doubt; and he does so with a marvellous felicity; but it is done in a way that is all his own. His opinion is not public opinion; his criticism is not expressive of the development of general taste. With him every word and every thought is personal, private, and peculiar. His imitators are legion; a few understand him more or less, the many do not understand him at all. The few are frequently troublesome to deal with; the many, much more frequently, are impracticable.

What is called a feeling for Gothic art in its general form has done more than Ruskinism to produce that so-called public opinion which is dissatisfied with the work of English architects. But the dissatisfaction of such critics with foreign architects is greater still. A quaint ideal of quite imaginary mediævalism takes in different minds different forms; and if modern work fails to come up to such a standard, how could it well be otherwise? What makes matters worse, the mediævalist element itself is now being supplanted by an influence which as yet is immature, and indeed amorphous—without form and void; and when discontent in such circumstances is wholly vague, and practical reform beyond the reach of skill, such conclusions are as certain as cause and effect can make them.

The popular ridicule of æstheticism is not a mere whimsical jest. It represents a legitimate reaction. It may be called common sense reacting against uncommon sense. Both are right; in fact, both are serious protests of public opinion, the one against indifference or old torism in art, the other against the affectation of a too sincere artistic red-radicalism. But there is a deeper movement which the thoughtful observer can see to be going on in English public opinion with regard to art, of which superficialities such as these convey but a feeble idea. The imaginative faculties and the critical acumen of the English as a nation are slowly but steadily acquiring the force of a great current of human culture; and not only the contests of doctrine about dress and decoration—far less the likes and dislikes of the world of burlesques and caricatures, comic songs and frivolous tales—but even the rival popularities of our picture galleries and curiosity shops, increasing as these are in number every day, and every day advancing still more notably in the money value of their contents, are less important to the public interest, and less worthy of the name and dignity of public opinion, than the quiet undercurrent of frequently unconscious and almost always undemonstrative general feeling which is giving a national complexion to the national taste.

Does architecture share adequately in this? Unquestionably it does. Indeed, it may be said to take a larger share of popular interest than is supposed. Graceful buildings can never fail to appeal to the sympathy of all classes. Where pictures and statuary, priceless articles of *virtu*, costume and ornamentation of the choicest elegance, and art manufactures of the most exquisite device and workmanship, are *caviare* to the multitude, a pleasing specimen of architecture in the public street is a tribute to the good taste of every passer-by—a tribute which even the most cynical, save in the way of academical criticism, must instinctively honour as it honours him. It is to the growth of the national disposition to encourage the everyday endeavours of everyday grace in building that we prefer to look for the advance of a real public opinion in respect of architecture, as distinguished from all those artificial and conventional standards of criticism which profess to represent the feeling of a nation, and only indicate the crotchet of a school. It cannot be denied that at the present moment, viewed from this standpoint, English public opinion upon architecture is weak and uncertain; but the arts, like all else, must bide their time, and the arts can afford better than most things to do so. Only let us be sure that the educated multitude of Englishmen and Englishwomen are learning the right lesson, and time will do all the rest. Differences there must be, jealousies, rivalries, disappointments, discords; but from these very elements it is that the evolution of art must choose its instruments, and by their means it is that it must attain its ends. Looking at what English architecture was—as a whole national product—even thirty years ago, and at what it is now, no one need complain of the pace

at which public opinion is acquiring that understanding of the art which, by encouraging the artist to exertion, compels the development of his powers.

## OXFORD.

[BY A CORRESPONDENT.]

THE late Royal Commission that was appointed by Government to examine into and rearrange the educational machinery and finance of the different societies or colleges that together form the University of Oxford, have proved themselves to have been good friends of the architect and builder. When the members of the several colleges had to assemble together that they might set their house in order, and be the better prepared to meet the dreaded investigation of the Commissioners, the question naturally arose, what was to be done with surplus funds—those monies that were evidently over and above that which they would be allowed to distribute amongst the members of their college, or offer in the form of exhibitions, &c., to the youth of the University? The Dons had no wish to hand over more of the funds belonging to their ancient societies than they could avoid to the manipulation of a Royal Commission whose existence they looked upon at least with disfavour, if not with aversion, as an insult and sign of distrust in their wisdom and capacity. They were therefore in a suitable frame of mind to consider favourably claims for improvements in their own premises and machinery that had for long remained acknowledged but neglected facts.

The absence of any proper building in which the University Examinations could be held, seemed all at once to startle them as a strange oversight. A liberal contribution was at once offered by each college from its funds towards supplying this great want. The result is that a stately pile of buildings, most commodiously planned, having its main façade in the "High," extends away back to King Street, the whole cost amounting to near the very respectable sum of 170,000*l.* This is an instance of the collective action of the colleges; but many of the individual societies have engaged in building on their own account. Colleges that for years had been content to send those of their "alumni" whom they could not accommodate within their own walls to the shelter of "licensed lodgings," at the prospect of the Commission saw the error of their ways, and determined to amend them by building new "quads" or wings to the ancient pile. College chapels, whose leading features from time immemorial had been dirty plaster, dingy windows, and a frowsy smell, were suddenly found to be unworthy of the high and holy use for which they were intended. Cleaning, restoration, and embellishment became the order of the day. And so the architect and artist, who up to that time had been only occasional visitors, took up a nearly permanent abode in this city of colleges.

Nor has the good work been limited to minor additions and restorations, for some colleges have been nearly rebuilt—such as Balliol and Exeter; and Mr. BUTTERFIELD has given us a brand new pile of buildings in Keble College. The Indian Institute at the end of Broad Street, the foundation-stone of which was laid not long since by the Prince of WALES with full masonic, collegiate, and civic honours; some new churches, the boathouse and lesser erections, all add to the varied feast offered by Oxford to the eye of an intelligent visitor. The city ought to be visited by young architects more often than it seems to be, for there is here plenty of food for thought. The best of their seniors have done work of various degrees of merit; and, as the clients for whom they have laboured have been no niggards, the architects have had a fair field and plenty of favour.

As the distance from town is so short—only one hour and twenty minutes by a good train—a young man (or even middle-aged for that matter) could scarcely spend a Saturday and Sunday better than by first making a sketching tour of the colleges, noting down by a few vigorous, clean, and decisive lines the many tit-bits and artistic groupings that are to be met with in, I may say, all the streets, lanes, and nooks and corners of the colleges. On Sunday he could be improved and delighted by some of the great orators and fine musicians for which the place is famous.

Having said so much about the general aspect of this ancient city, I will now descend to details and consider separately a few of the most important recent additions to Oxford.

Out of compliment to Londoners, let me commence at the end of the "High" nearest to them. Here we find Magdalen College and the bridge over the Cherwell. This same bridge has just been doubled in width, and is completed all but the laying of the roadway and the relaying of the tram-lines. This work is a great improvement to the "High" and to Magdalen College, as you can now get further away from the base of its beautiful tower, which is the glory of the city, and so group it in better with its surrounding trees and buildings. It was a thousand pities that the engineer of this bridge did not see his way to lower the altitude of the centre, as it so much detracts from the dignity and elevation of the tower and its accessories. Some excellent photographs have been taken of the Magdalen Tower from the opposite bank of the river Cherwell, far below the level of the bridge. Comparing these with others taken from the bridge roadway, the injury caused to one of the finest views in Oxford by the action of an engineer becomes painfully evident. Magdalen, take it all in all, is about the most complete of all the Oxford colleges. It is well situated at the bottom of the main street and on the bank of a river, and having plenty of land of its own—rejoicing even in a deer park—it is not "cabined, cribbed, confined," as so many others are, by the unpleasant contiguity of their learned neighbours. Part of this happy abundance of space has, very properly and effectively, been given up to trees. The row of fine elms that run between the gateway and the choir school gives a touch of nature that accentuates and enlivens the adjacent art. Since the completion of the college, about A.D. 1481, many changes have been made in the entrance gateway. The present handsome archway, built by PUGIN in 1844, superseded a rather elaborate Classical structure, of which there are engravings still extant, of very similar dimensions and construction, consisting of a circular-headed opening, having the tympanum filled with wooden fan tracery. The arch is flanked by coupled Doric columns, and over all a curved pediment, broken in the centre to receive a small open canopy enclosing a figure. As this gave way to PUGIN's, so PUGIN's gateway is doomed to be replaced shortly by something else; and eventually it will find a new home by a river, the Magdalen bank of the Cherwell. The new block of buildings designed by Messrs. BODLEY & GARNER, which forms half of a new quadrangle, has its main front immediately behind the row of trees already referred to, reaching from the PUGIN gate to the choir school. Here stood formerly the main part of Magdalen Hall, which was burnt down some time since. A small portion, which is one of the quaintest pieces of architecture in the city, stands in a line with the President's lodgings. The architecture of this new block is carefully based upon that of the old building. The front elevation contains eight main gables, besides dormer windows, a great amount of breaking up of the roof for a façade of no very great length. The effect would doubtless be fussy could the whole length be seen in one unbroken view from the High Street; but as the line of tall trees prevents this, and only occasional peeps of beautifully rich bits can be obtained here and there between the boughs, the general effect is most picturesque. So far the buildings provide accommodation for two sets of fellows' rooms and twenty-nine sets for undergraduates, with two lecture rooms. The fellows are accommodated on the first floor next to the main entrance, and below them are placed the lecture rooms. At the back of this end of the building rises a tower with angle turret staircase, terminating above in a richly crocketed spirelet or pinnacle similar to several of those in the old work. It seems a pity that this tower should be hidden away where it is. Had it been brought to the front it would have given variety to the long line of gables, enriched the neighbourhood of the main entrance to the college, and in no objectionable way have competed against the more ancient towers in its vicinity. Finely moulded open arches lead through the base of this tower, which forms a sort of groined entrance porch to the lecture rooms and fellows' lodgings. Over the front arch is an oriel window of two storeys, rich with carved panels and crested cornice. The top of the flanking buttresses is pierced with groined niches containing beautiful little figures. It is wonderful what a great difference there is in the artistic appearance of the same niche or canopy when empty or filled with a figure, even though the figure be but poor in design and execution. Of course it is not every day that architects come across clients whose pockets can "stand" the expense of figures. But should not architects more generally husband

their resources for one great effort about the entrance of their building or centre of the design, instead of frittering away the amount that they can allow themselves for carving, &c., in unnecessary mouldings and trivial decoration over the whole of their work? Messrs. BODLEY & GARNER have, in the present instance, the good fortune to be able to put their ornament, and as much of it as they like, on both the back and front of their work. In the quadrangle, or semi-quadrangle, the niches at top of buttresses are filled with figures as in the front. The main string-course at the back is one long row of large gargoyles and bosses of considerable size, about four or five feet apart. Carved panels also are frequent and elaborate. In fact, the carving tools have had full play, and have been handled with considerable fancy and skill. It is no slight tax on the inventive faculties of the designers to be able to say that, of the many hundred bosses to be found throughout the building, no two are similar.

The first gable facing the high road is enriched by a very tall oriel window of two storeys, that rises from an attached shaft on the ground-floor, from the cap of which spring groined ribs which catch the base of the oriel. The central space between the first and second floor windows of this oriel is taken up at the sides by two plain panels, and in the middle with a most spiritedly carved angel with spread wings. The oriel is finished above with a foliated cresting. The several parts of this oriel are good in themselves, but the effect of the whole is that of being too lanky and as though it were unfair to place so much upon such a poor little shaft. It looks, too, as if the whole were *appliqué*, or stuck on after the gable had been finished. This defect is caused by the main string breaking where the oriel occurs, instead of being run round it and binding it to the whole building. This treatment would have had the further benefit of cutting up the great vertical height of the oriel by the intersection of one bold horizontal line. In the case of the two-storeyed oriel on the quadrangle side of the Founder's Tower the base has a perfectly firm appearance, and there are two well-defined strings above and below the central or blank compartment. In other instances in these new buildings I differ from the architects in the use of the string-course. They are too ready to break the string by the upward passage of a buttress or the like, so losing horizontal bond. In the old quadrangle the string passes round the buttress, giving a very beautiful effect in perspective. In some cases buttresses that have passed the lower and minor string (which is a mere continuation of the hood-mould of the lower windows) run up for fifteen or twenty feet through the main string-course without any tie or connection with the walling. The result is that they look naked and lonely.

The two next bays to the corner one have wide shallow oriels, of one storey only, rising each from a similar wall shaft. Above and below these are windows, so that the whole gable looks rich and light. The dormer windows are little gems in their way, with their highly-wrought oak verge boards and quarry lights. The college authorities will not have quarry glazing in the sitting or lecture room windows, and I think that they are wise, as most of the windows run small, and there is a great amount of tracery in the heads. And I have something, too, to say about this same tracery. In most cases it looks too thick and massive. The section across any rib in the tracery appears to be as great or wide in section as the mullion from which it rises. Most Gothic men know that the ancients avoided the appearance of clumsiness in their tracery by making the curved or straight portions thereof less wide than the mullion to whose order it belonged. Again, in the matter of the shape of the arch used, the type common to the college has been adopted, the peculiarity being that, instead of being four-centred, as in the best specimens of the Perpendicular period, as soon as the small curve which commences the arch is finished the rest of the span is worked in a straight line. The constructive and artistic defect of this shaped arch is not so apparent in the old cloister windows, as tracery is placed below and the whole opening cut up into three lights; but when the tracery and mullions are omitted the result is distressing, the straight part of the arch, to use a paradox, actually appearing to droop or sag like a defective beam.

The chimney-stacks are very nice. They generally ride upon the ridge of the roofs in groups of four flues. Each chimney-top is fluted with rosettes or pateræ at intervals up the flute. Towards the top is a small necking, with carved cresting upon it.

Each student has, in addition to his sitting and bedroom,

a nice little pantry, where all his extraneous belongings can be kept. At the bottom of the staircase is a scout's closet. The staircase is of stone, and the floors are made fireproof. The fireplaces in each room, as well as the inner arches of the windows, are of moulded stone, and a stone plinth surrounds the tiled hearth.

I could say much more about these fine buildings, upon which no money or labour have been spared. Suffice it to mention that the stone used is of a fine yellow colour, from Staynton, good in texture, and known to have stood well in the past. Rotten stone has been the curse of Oxford. Witness Peckwater Quad, and the numerous black colleges whose outer skin is shaling off. The roofs are covered with Colly Weston stone slating. Mr. FRANKLIN is the builder, and Mr. McCULLOCH the carver. The cost is about 40,000/.

## ANCIENT LONDON.\*

THERE is some fitness in the publication of Mr. LOFTIE'S "History of London" at a house which is known for the excellence of its maps, topography having much to do with the character of the work. At present the metropolis has an area of nearly one hundred and twenty square miles. Roman London hardly included a square mile within its boundary; three centuries ago the area was less than three miles, and in the eighteenth century the area was not more than five square miles. From these figures it is plain that for a long period the growth of London was at a very slow rate, especially if compared with that of modern times; and when we understand the reasons for this difference, we are on our way to a knowledge of the history of London. The collection of maps in Mr. LOFTIE'S volumes, together with his disquisitions, form a trustworthy guide that can be followed with safety.

The word London suggests that the city was the site of a Celtic or early British fortress. PENNANT said it was derived from Llyn-din, the lake town or fort, and modern archæologists can discover no better explanation. Mr. LOFTIE prints a letter from the late GODFREY FAUSSETT, of Canterbury, in which he says: "I have never doubted what it was that the Romans turned into Londinum—to wit Llyn-din, the lake fortress. London was in those days emphatically a Llyn-din, the river itself being more like a broad lake than a stream, and behind the fortress lying the 'great northern lake,' as a writer so late as FITZSTEPHEN calls it, where is now Moorfields." It is now difficult to believe that a city which is a mass of buildings could at any time have been a swamp or lake, but with such a river as the Thames, which was fed by streams on both sides, and looking at the conformation of the ground, we can imagine that there were floods occasionally, and that in parts the water remained until it was absorbed. The highest ground would be selected for a cattle-pen and residence for the settlers. It is, however, doubtful what part of London can claim to be the site of the primitive Llyn-din. If we believe the inscription on the slab in Panyer Alley, the greatest height is to be found there; but, according to the Ordnance Survey, Cheapside is quite as high, while Cornhill stands one foot higher.

It must be confessed that at the time when the Romans invaded Britain they did not attach much importance to our metropolis. CÆSAR does not mention London. It was at one time believed that BOADICEA captured the city—and slaughtered the strangers—but the queen's deeds, like King LUD'S, are now treated as imaginative, and we have not met her name in Mr. LOFTIE'S volumes. Whatever may have been the value of the place, the rulers did not consider it necessary to enclose Augusta with a wall until the middle of the fourth century. According to HARRISON the wall was 3 miles 205 yards in length, and enclosed a space of 380 acres. The remains, which are dug up from time to time, are evidence that, limited as London was in those days, the Romans were surrounded with the things which make life elegant. It was described as "Londinum urbs magna et opulenta," and it appears to have had some claim to the second adjective if not to the first. There is, too, the authority of TACITUS for its mercantile importance. On the strength of this evidence some authorities would have us believe that London was a

\* "A History of London." By W. J. Loftie, F.S.A. With Maps and Illustrations, Edward Stanford.

Western Rome, and that both cities could trace their origin to descendants of ENEAS and VENUS. People now take a more sober view of things, and the modern spirit is seen in Mr. LOFTIE's conclusions. There was a Roman London, but we know little about it, and we cannot prove that it was the capital of Britain. What we do know is, "that far beneath the feet of the busy throng which presses every day the pavements of modern London, there lie buried the traces of an ancient city." It may be the task of the New Zealander of the future to exhume them.

The Romans were compelled to depart, and for nearly a century there is no record of London. The Britons of Kent fled to it from the Saxons, and the scared fugitives were unable to defend the Roman walls against the invaders. There appears to have been a great slaughter, and in course of time London is heard of as the chief town of the East Saxons. To them it was valuable from its position. As Mr. LOFTIE says:—"The Britons had lost the art of using walled cities; the Saxons had not acquired it. London was equally useless to both." But to the Saxons, as to people of a later age, the Thames was an acquisition, and, as STOW wisely remarks, London could not "be pitched so commodiously upon any other part of the same river of Thames as where now it standeth." London was probably esteemed by the Saxons as an excellent place in connection with expeditions that were somewhat piratical in character; but, fortunately for London, a new influence then began to be exercised. In the reign of ETHELBERT the Abbot MELLITUS was made Bishop of London, and a cathedral for him was erected at the expense of the Saxon king and his nephew, SEBERHT, the Essex prince. On the bishop's banishment, after the death of SEBERHT, London appears to have relapsed into heathenism. Christianity was re-established mainly through the exertions of ERKENWALD, Bishop of London. A charter which was granted to him bestowing some lands at Barking is to be seen in the British Museum. One circumstance is mentioned by Mr. LOFTIE which indicates how the old order of things gave place to new in those days. Bishop ERKENWALD is believed to have erected a gate at the northern entrance of the city, although STOW says the builder is unknown, and ever since the memory of it is preserved in the term Bishopsgate. We are told that "nothing can better show the decay of Roman roads and Roman gates than the fact that, though Bishopsgate Street leads from the bridge to the great northern road, the old line was not preserved." To this period may be traced the foundation of churches dedicated to the Saxon saints, BOTOLPH, OSYTH, and ETHELBURGA.

London in the ninth century ceased to be the chief town of a principality, and under EGBERT it became the capital of the Saxon kingdom. It had to suffer for its importance when the Danes arrived. Then it was captured by ALFRED, and his son-in-law, ETHELRED the Alderman, held it against all opposition. It was only a question of time, however, for the Danes were afterwards masters of London and of England as well. Some traces of their presence is to be found in churches dedicated to St. OLAVE and St. MAGNUS, and with less certainty in the churches of St. Clement Danes and St. Bride. WILLIAM of Normandy granted a charter to London, in which the exceptional freedom of the citizens was preserved. But by erecting the Tower he was able to control the river, which brought wealth to the city, and therefore the city itself. It is remarkable that London was excluded from Domesday Book, for what reason cannot be conjectured.

We obtain a picture of the city's condition in the following century from the description of WILLIAM FITZSTEPHEN, a monk of Canterbury, who was a native of London. Judging by the space occupied by his account of London sports, it would seem that the citizens were occupied with mysteries, tournaments, leaping, hunting, hawking, and other sports; and they were noted above all other men for their manners, dress, table, and discourse. But Mr. LOFTIE believes that some of the words suggest the existence of a darker side, such as the allusions to ill-government, immoderate drinking of foolish persons, and frequent fires. It would speak little for FITZSTEPHEN's gratitude if he did not speak well of the citizens. They were good friends to the Church. An imaginary map of London in the thirteenth century, introduced in Mr. LOFTIE's book, is remarkable for the quantity of ground that is appropriated to religious orders. The Greyfriars or Franciscans had a large piece at Newgate; near it was the Benedictine priory at Smithfield. The Blackfriars had property extending

from Ludgate Hill to the river. Then there were the Augustinians near London Wall, the nuns of St. Ethelburga, the Abbey of St. Clare, New Abbey near the Tower, &c., all occupying an extensive area. These houses, so far as is known, corresponded with religious houses now, and were independent of the parishes into which London was divided. According to FITZSTEPHEN London and the suburbs contained thirteen of the large conventual churches and 136 parochial churches. How these parishes were established is uncertain. There are still a great many of them, and the majority consequently are of small size. Their existence is, at the present day, an inconvenience which legislation has tried to diminish by amalgamating several of them, so as to provide a congregation. Mr. LOFTIE supposes that the existing parishes formed part of still larger parishes which were broken up. In Queenhithe Ward there are three adjoining parishes dedicated to St. MARY, and two have St. NICHOLAS for patron. Dowgate has Allhallows the Great and Allhallows the Less, and there are three parishes of St. Katherine. Such small parishes very likely had some community of interest, and the wards and trade companies also gave opportunities for association and for discipline. The order of everyday life is to be inferred from what FITZSTEPHEN records:—"The artisans of the several crafts, the vendors of the various commodities, and the labourers of every kind, have each their separate station, which they take every morning." The history of the civic associations has been investigated in modern days with zeal, and new light has in consequence been thrown upon the history of London. Mr. LOFTIE's chapters on "The Rise of the Companies" and "The Wards and the Companies" are among the most interesting in his work. Mr. LOFTIE does not attempt to give a chronological inventory of events which occurred in the great city. From the companies he passes on to the abbeys, convents, and other ecclesiastical companies. Then, after describing the London of DICK WHITTINGTON, we find an excellent chapter on SHAKESPEARE's London. Mr. LOFTIE says that when the poet "lays his scene in Illyria, or at Verona, or Messina, the watchmen are from London streets; the palaces are London houses; DOGBERRY himself is a tradesman upon Cornhill." But this is going too far. There is no dramatist of that age who seems to have drawn so little inspiration from London as SHAKESPEARE. We have only to compare his characters with JONSON's, or with those in "The City Madam," to see that the life of the citizens is not reflected in SHAKESPEARE's comedies. "The Merry Wives of Windsor" we can imagine to be a sketch from reality as respects some of the characters, but it has no counterpart with the citizens of Cornhill and Cheapside among the *dramatis personæ*. Why a man who in social position did not spring from a higher rank than BEN JONSON ignored the people who then lived in London, is a question well worth discussing, and a satisfactory solution of it would do much to explain the mystery that attends the production of the plays. But it could not be attempted in these pages.

In his next chapter Mr. LOFTIE has to relate, under the head of "The War, the Plague, and the Fire," events which might almost be said to have put an end to ancient London. During the five days' fire 396 acres of houses were destroyed, comprising 15 wards wholly ruined, 8 others half burnt, 400 streets, 13,200 dwellings, 89 churches, besides chapels, and four of the City gates. "The loss of property could hardly be estimated. It has sometimes been reckoned at between three and four millions sterling, but this is irrespective of inestimable things, such as monuments, libraries, records, and objects of personal value. London, in short, as a city, was obliterated from the map." It was soon to be recreated.

The first volume of Mr. LOFTIE's history deals with the City. In the second volume he treats of those parts of the metropolis which are outside the City boundary, and the author gives descriptions rather than a narrative. The interest of the two volumes is continuous, for in the second we have traced the growth of the existing metropolis, and the history of the Abbey of Westminster, the Houses of Parliament, the palaces, parks, on the western side, and of the Tower on the east; while the suburbs are described from Chiswick to Stepney, and from Highbury to Kennington. EDMUND BURKE once defined London as "an endless addition of littleness to littleness, extending over a great tract of land;" but there is sufficient human interest about the place to inspire a great many writers, and among their books Mr. LOFTIE's must hold a high position.

## PARIS NOTES.

ART frauds are occupying much of the time of the French law courts. The Corot-Trouillebert suit is still pending, and another affair of the same kind has come up during the past week. A son of M. Huet, the landscape painter, saw exhibited in the shop of a picture dealer in the Faubourg St. Honoré, one of the most important thoroughfares of the capital, a painting marked Théodore Rousseau, which he recognised as one of his father's works. It had formed part of a sale which took place in 1878, when it appeared in the catalogue as No. 83, *A Study near Meaux-en-Brie*. He entered the shop to examine the picture under the pretext of purchasing it, and the dealer assured him that it was a real Rousseau. He saw, however, that his father's signature had been effaced, the letters "Th. R." inscribed in its place, and the name Théodore Rousseau in full added on a tablet on the frame. At the back of the picture was a ticket imitating that of the Rousseau sale, and covering the ticket which had indicated that the picture formed part of the sale of Paul Huet's works. The son had the painting impounded, and applied to a judge in Chambers to have a receiver appointed until the hearing of the suit he has commenced to have his father's name restored.

The Civil Court of the Seine gave judgment on Saturday last in another action relative to the authenticity of a group attributed to Clodion, which had already come before the same Court in January 1880, and before the Court of Appeal in April 1882. On the last occasion experts were appointed to examine the work in question, which was represented to be "a Faun, Bacchante and Child," in terra-cotta, by Clodion. The plaintiff was Madame Bernage-Boiss, a dealer in curiosities, who in 1873 purchased the group of M. Mailliet du Boulay, Conservator of the Museum of Antiquities at Rouen, for 12,000 frs. She demanded that the sale should be annulled, on the ground that the signature of Clodion at the back of the work had been inserted and painted over to imitate the colour of the group. M. du Boulay called into the suit a M. Demère, from whom he had purchased the work for 4,350 frs. in 1872. On the report of the experts, who were the well-known artists, Messrs. Guillaume, Chapu, and Aimé-Millet, the Court found that the allegations of the plaintiff were proved, ordered both sales to be cancelled, condemned M. du Boulay to reimburse to Madame Boiss the 12,000 frs., with 5 per cent. interest since 1873; and Demère to refund to Du Boulay 4,350 frs., with interest since 1872, besides bearing all the costs of the case, which are extremely heavy.

The second exhibition of portraits of the century, which it was proposed to hold for a charitable purpose, has had to be abandoned, the committee not having been able to secure suitable premises. Its president, the Marquis de Montemart, has therefore issued a notice thanking those persons who had promised to send pictures, and expressing the hope that he may be enabled to avail himself of their offers next year.

The French painter, Henri Gervex, has just received the Cross of the Order of Leopold. The distinction has been conferred upon him in connection with the Ghent Exhibition, to which he sent his *Bureau de Bienfaisance*—a painting much observed in last year's Salon.

M. Auguste Vaudet, the engraver on precious stones, has been entrusted by the Minister of Public Instruction and Fine Arts with the engraving of *Le Départ des Volontaires de 1792*, Rude's magnificent work on the right side of the Arc de Triomphe. The minimum time required for the work will be six years, and the sardonx upon which it is to be executed ranks in point of size with the four or five largest engraved stones known, of which the biggest of all is in the collection attached to the French National Library.

Mercié's fine group, *Gloria Victis*, formerly placed in the Square Montholon, and the *Dernières Funérailles*, by Barrias, have just been erected on pedestals in the Cour Louis XIV. of the new Hôtel de Ville. The former, which is in bronze, occupies the centre of the court, while Barrias' marble stands under the gallery, before the door of the Salle des Pas-Perdus. It has been decided to place the two lions by Cain, belonging to the Municipality, one on each side of the Place Lobau entrance to the Hôtel.

In the quarterly competition for figures drawn from nature the jury of the Ecole des Beaux-Arts, under the presidency of M. Bouguereau, have awarded the first medal to M. Fossey, pupil of MM. Bouguereau and Tony Robert-Fleury; the second to M. Léandre, pupil of MM. Bin and Cabanel; and the third to M. Eliot, who has been studying under the same masters.

There seems at last some prospect of the ruins of the Cour des Comptes, on the Quai d'Orsay, being replaced by a new Museum of Decorative Art, which, under the scheme that appears likely to be adopted, would in fifty years become the property of the State. The expenditure on the building alone is estimated at 6,000,000 frs., which sum is already deposited at the Bank of France, and the promoters of the institution ask for the concession of the site on the Quai d'Orsay, which will doubtless be granted.

The statue of Alexandre Dumas the elder, by Gustave Doré, unveiled a few weeks ago on the Place Malesherbes, threatens to give rise to a lawsuit. A bronze tablet on the pedestal enumerates the works of the novelist. Among these is named the melodrama "La Tour de Nesle," about the authorship of which there was formerly much dispute, although it is now generally admitted that the play was principally by Frederick Gaillardet. During Dumas's lifetime, in fact, it was arranged that his name should only follow that of Gaillardet as co-author. As no mention whatever is made of the latter in the list above referred to, his widow has served a writ on M. Halanzier, late Director of the National Opéra, and a prominent member of the Erection Committee, calling upon him either to have "La Tour de Nesle" effaced from the tablet within fifteen days or to add the name of her husband as joint-author of the piece.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixth ordinary meeting of the Institute was held on Monday evening, Mr. Ewan Christian, vice-president, in the chair.

After the minutes of the previous meeting had been read and confirmed, a member rose and remarked that the present was the first meeting since the allegations against the profession contained in *Truth* had been brought officially before their notice. He asked whether it would not be fitting to pass a resolution repudiating those allegations.

The SECRETARY asked if notice had been given of the question. If notice had not been given the question could not be put, the business of the meeting being the reading and discussion of a paper.

The member replied that he had not given notice, but he thought the matter was so important that a deviation from the rule should be allowed.

Mr. E. C. ROBINS, F.S.A., considered it would be making too much importance of the matter to take any notice of the allegations.

Professor KERR said that far too much had been made of a matter which was unworthy of the slightest notice.

The CHAIRMAN having ruled that the matter was beneath the notice of the Institute, the reading of the paper was proceeded with.

**The Action of Lightning Strokes in regard to the Metals and Chimneys of Buildings.**

Colonel the Hon. ARTHUR PARNELL, late R.E., then proceeded to read portions of a lengthy and elaborate paper under the above title, of which the following is a brief abstract:—Colonel Parnell prefaced the paper with a sketch of his plan. He deemed that the best form in which to present his case to a body of practical men like the Royal Institute of British Architects would be to make the heart of his essay a mass of hard facts, associating with these facts an analysis separating and classifying the more important circumstances and phases of action recorded in connection with the lightning strokes, and to supplement the whole by a brief commentary. The paper was the fruit of his research during the last four years into the nature of the action of thunderbolts. The cases, 506 in number, were picked out from a collection of recorded instances of lightning strokes, 1,145 in all up to date, occurring between January 24, 1665, and November 23, 1883. The selected cases embraced those only in which buildings were concerned, and in which metals or chimneys were described as present in the immediate neighbourhood of the scene of the stroke. The rest of the prefatory matter detailed the principles kept in view and the methods followed in indexing the records. Among the selected cases the following fifty occurred, namely:—

(43) Swinton, Eccles, near Manchester, August 6, 1809, Mr. Elias Chadwick's house. Adjacent was a brick coal-shed, above

which was a cistern, with flagged top, bottom, and sides. Foundation of shed a foot below ground. Its walls were strengthened by bond timbers. Effects: Wall of shed slightly shifted from upright, the copings remaining entire. Bond timbers driven further than brickwork, and looking scorched. Weight of displaced material 26 tons. Metal spout, brackets, and leaden water-pipe uninjured. (92) Parish church of Week, St. Mary, Cornwall, November 8, 1878, the tower of which had been struck in 1688, 1812, and 1843. Details of latest disaster from the Rev. G. Hopkins, rector, and Mr. J. P. St. Aubyn, F.R.I.B.A. (102) St. Michael's Church, Stamford, August 14, 1857. Pinnacled tower. At base of south-east pinnacle and 3-inch iron rain-water pipe entering the earth. The effect of the discharge was to uplift the whole mass, imparting to it at the same time a kind of circular motion to the southward, the apex of the pinnacle falling in a line with its original base, and the base having traversed about the eighth part of the circle fell into the root of the tower. The pinnacle was a mass of masonry bound by iron clamps, and weighing about 15 cwt. (110) Nash Low Lighthouse, August 31, 1852. Description from Professor M. Faraday. (116) Villa at Cannes, France, about 1874. High position, but a much higher villa and on higher ground within 100 yards untouched. The remarkable details of the effects of the discharge were given from Mr. H. R. Dugmare, who was in the house at the time. (120) Berehaven Lighthouse, February 1877. The stroke doubtless a multiple one. Particulars taken from report of inspection to Irish Light Office, Dublin. (121) Upwood Gorse, Caterham, Surrey, May 28, 1877. House of Mr. J. Tomes, F.R.S., the highest object in the neighbourhood, with steep tiled roof. Details reported by Mr. Rogers Field, M.I.C.E. (136) Brónó Church, Norway, October 17, 1872. Had a lightning-rod of iron or zinc wire, which, however, was rusty at junction with ground. The stroke wholly destroyed the church. (173) Wheatland, Indiana, U.S.A., April 2, 1879. The school-house. Had iron lightning-rod with earth connections. House wholly destroyed. (187) Edgehill, June 20, 1821. House of Mrs. Clare, named Edgevale. The curious and instructive details of the mischief done by the stroke given in the order adopted by Mr. Howard in his description. (231) Ardersics, near Campbelton, September 1, 1824. A house occupied by Miss Bremner. Howard's order of effects of the stroke followed in this case also. (271) Streatham, June 12, 1748. Mr. Howard's public-house. Effects of the electrical discharge taken from paper by the Rev. H. Miles, D.D., in *Phil. Trans.* xlv. 383. (273) Trythal, near Mælpæ Hill, Cornwall, December 20, 1752. Mr. Thos. Olivey's farmhouse. Effects of stroke detailed by the Rev. W. Borlase, M.A., F.R.S., in *Phil. Trans.* xlviii. 86. (279) Lostwithiel, Cornwall, January 25, 1757. Parish church. Copious particulars given from *Phil. Trans.* l. 198, and *Gent. Mag.* xxviii. 427. (286) Pembroke College, Oxford, June 3, 1765. Authority from detailed account of catastrophe, Mr. Griffith in *Phil. Trans.* lv. 273. (288) St. Keverne's parish church, Sunday, February 18, 1770, struck during service. Particulars of case given by the Rev. Anthony Williams, vicar of the parish, in *Phil. Trans.* lxi. 71. (290) Whitfield's Chapel, Tottenham Court Road, London, March 18, 1772, a Sunday, the part struck being an addition made to the original building, and less lofty. A man sitting on a ladder lying flat on the ground, with his back against the chapel door, was killed. Record by Mr. Henley in *Phil. Trans.* lxii. 131. (294) Gais, Appenzel, Switzerland, 1873. The village much subject to thunderstorms. Every house had iron lightning-rods on it, varying in number from two to eight. Two chalets, each defended with two, were burned to the ground. Authority, Dr. Williams, in *Journ. Roy. Met. Soc.* ii. 432. (310) Salford, August 6, 1849. Works of W. Collier & Co., machine makers. Boiler chimney, fitted with iron lightning-rod, struck. Details from Mr. Wm. Sturgeon, in *Proc. L. and P. Soc.* Ser. 2, ix. 60, after examination. (321) St. Mary's Church, Crumpsall, Manchester, Jan. 4, 1872. Circumstantially recorded (*ibid.* xi. 70) by Mr. Henry Wilde. (323) St. Paul's Church, Kersall Moor, Manchester, summer of 1863. Mr. Henry Wilde reports this case also (*ibid.* p. 72). (346) Government House, Calcutta, March 30, 1838. Details quoted from Dr. O'Shaughnessy, M.D., F.R.S., in *Phil. Mag.* xxiii. 177. (348) West Street, Whitechapel, London, July 26, 1849. Three houses on south side of street, Nos. 17, 21, and 22. At No. 17 a man, who was opening the door at the time of the discharge, was killed on the spot. At No. 21 a woman working at a silk-winding machine was hurled across the room. She had a spindle in her hand at the time. Details quoted from Mr. W. Radcliff Birt in *Phil. Mag.* xxxv. 161. (387) Sheffield, June 5, 1879. House of Mr. Osbaldistone described (with details of damages to the extent of 500*l.*, resulting from its being struck by lightning) by Mr. Newall, F.R.S., in *Nature* for June 12, just a week after the event. (388) St. Marie's Church, Rugby, June 5, 1879. Mr. Howard (III. 161) furnishes the details. (398) Lumley, near Chester-le-Street, Durham, June 9, 1883. The "Old Hall," an old stone house, in dilapidated condition, at about the highest part of the village. The effects of the stroke investigated by the colonel himself from floor to floor, roof and chimney stack, three days after the disaster, and when it was as yet unknown (the doors having been locked) that any harm had been done inside. (446) Leeds Prison, July 12, 1883. Inspected by Colonel Parnell,

at the instance of the Hull Prison Commissioners, a fortnight afterwards. (469) Lichfield, a vicarage struck, July 2, 1883. Details from Canon Curteis, M.A., in *Morning Post* (July 14, 1883). (549) St. John's Church, Bury St. Edmunds, May 1871. Spire 160 feet high, built of Suffolk brick, with a copper lightning-rod, which did not avert the catastrophe. (559) Furze Hill, Brighton, June 1868. A detached school. (567) Ripponden Church, October 1873. The lightning, in spite of conductor, if not under its guidance, melted the leaden section of the gas-piping, and ignited the gas at the meter. Had not a woman given the alarm, the woodwork in the tower must have been destroyed. (575) Claypolds, near New Bridge, Middlesex, August 19, 1876. House of Mr. Evans. Details from paper by Mr. Anderson, read at Dublin Congress, 1878. (669) Dusseldorf, January 11, 1815. Tower of St. Lampert struck, though provided with an iron lightning-rod. The point of the rod melted and the building caught fire. (670) Berne, May 14, 1820. A private house, with iron conductor fixed to a wooden pole near two chimneys, was struck, the flash filling all the rooms with a dazzling light. The ground was raised round the post of the rod, whose lower end showed traces of red heat. Three persons in the house were knocked down senseless, and other mischief done inside in the house. (680) Koppingen, Switzerland, June 5, 1819. House of Mr. Anderegg, a wooden one, was not saved from lightning by its iron conductor, with its two brass-pointed terminals skywards, and its leading into moist earth. The house was fired, and the brass points vanished. (704) Farmhouse at Bucklawren, two miles from Looe, Cornwall, struck June 26, 1756. Details of the disaster from *Phil. Trans.* 1757, and *Gent. Mag.* xxviii. 157. (860) Alphington Church, near Exeter, June 1826. Tower with pinnacles, bells, and weathercock. Lead roof with spouts. One person, with an iron hammer in his hand, was killed by the stroke, another was hustled many yards into the church, and the clothing of four was torn. The tower stairs were torn up, some heavy stones removed, the communion table dashed to pieces, and the whole building shattered. The tower wall was rent vertically, the bells were thrown out of gear, and the vane got twisted. (916) Newbury, New England, North America, 1755. Details from Benjamin Franklin, the inventor of the lightning conductor. (942) Toothill, Essex, June 18, 1829. A windmill. The stroke tore up the stones and gravel near the iron braces under the roundhouse stairs, as well as the floor of the lower room, and threw some iron weights into the yard. It welded into a solid mass the links of the iron chain used for drawing up the sacks, and utterly stripped off the iron-plated roof of the building. Howard (III. 321) and others were quoted for these and the rest of the details. (951) St. Martin's Church, London, July 28, 1842. The particulars of this well-known case were given from the Annual Register and other chroniclers of the time. (952) Brixton Church, London, struck April 28 in the same year. The church was again struck in July 1872. Details by Harris, 86. (955) Normanhurst Court, near Battle, Sussex, July 1880. The description was given after Mr. R. Anderson (*Tel. Journ.* October 1, 1880). (958) Hôtel des Invalides, Paris, June 8, 1839. M. Bugnot, Inspector of Works, gave a full account of the catastrophe in the *Comptes Rendus*, viii. 978. (967) Steeple Acton Vicarage, Wiltshire, June 20, 1772. Details by Mr. E. King, F.R.S., in *Phil. Trans.* lxiii. 231, and Harris 112. (1029) Bruntcliffe, Yorkshire, August 6, 1878. A small powder store, connected with Victoria Colliery, holding 2,000 lbs. of powder. Fitted with a copper lightning-rod fixed to a pole about 2 inches from one end of building by glass insulators. Point surmounted building by 13 feet. A heavy iron door at end, remote from rod not connected to the ground nor to the rod. Powder fired and store blown up. Two little girls 320 yards off wounded by falling *débris*, and adjacent buildings damaged. Case reported by Hill, Inspector of Explos., 17, 9, 78, L. R. C. 74. (1032) St. George's Church, Leicester, August 1, 1846. Copious details from Mr. E. Highton, C.E., who examined scene (*Journal of Soc. Arts*, 1846), and Anderson (177), who quotes Mr. C. Tomlinson, F.R.S. (1079) East London, South Africa. A powder magazine with an iron lightning-rod ending in a dry water-tank. Effects of stroke:—Building much damaged, rod "torn to pieces" (*Journ. Soc. Tel. Eng.* 12, 5, 75). (1080) Coast of Ireland, March 13, 1844. A martello tower, containing powder magazine, struck. Description, with accompanying plan, by Col. R. J. Nelson, R.E., in *Aide-Mémoire* to the Military Sciences, I. 391. (1116) Manayunk, Philadelphia, summer of 1871. The "Pekin" woollen works, though provided with lightning-rods, set on fire and burnt to the ground. Total estimated loss, 10,000*l.* Reported on by Professor John Wise, of the Wagner Institute.

The paper also contained an exhaustive analysis and marshalling of facts in groups, with pertinent and weighty remarks as to their evidential bearing, especially on the problem of the relative liability of houses with or without conductors to be struck by lightning, which, it was argued, must be solved in a sense adverse to Franklin's invention.

The concluding portion of the paper was devoted to "Practical Deductions," and this portion the author proceeded to read. Premising that he wished especially to guard against advising the members of the Institute to take any measures at all to safeguard buildings from thunderbolts, a matter wholly, in his opinion, for

the architect, the owner, or the occupier, the measures he proposed were meant simply as precautions prescribed by experience as likely to do good so far as concerned metals and chimneys. His general principle was that the use of metal in any form, whether outside or inside a building, should be minimised. He boldly condemned, as wholly useless, metallic external appliances—(1) lightning-rods; (2) vanes, weathercocks, finials, crosses, balls, and spindles; (3) bells and clocks in towers and in elevated parts of buildings; (4) iron ridge castings; (5) metallic balconies. Inside the buildings he condemned as useless the employment of metal in the instances of (6) large chimney-glasses; (7) gildings. As to handy metallic appliances, external and internal, a dozen numbered rubrics followed, with suggestions of substitutes in earthenware, terra-cotta, Portland cement, glass, or asphalt; failing which, hints were thrown out for eliminating, or more or less reducing, the peril. The items (Nos. 8–19) were—chimney-pots; flashings, hips, and other lead-work on roofs; eaves-gutters and rainwater pipes; wire guards to stained windows; tie-bars, cramps, and hoop-iron bond; copper nails for slate roofs; iron window-bars; gas pipes; roof-framing inside; flooring; organs, pianos, safes, and iron bedsteads; water-pipes. Special cases were those buildings, the bulk of which is necessarily metal, such as gasholders, oil tanks, great railway stations, and temporary erections of corrugated iron. The precautions to be taken in these instances consisted in metallically connecting the ironwork frame to the ground at one or more places, and in providing its most elevated metals with short spikes very sharply pointed, thus converting the metallic mass into an electric tap ready to eject the whole charge that may accumulate in the ground near its base in virtue of the physical property of metal points to throw off and scatter electricity. This property seemed to have been discovered by Mr. Thomas Hopkinson, an American gentleman, in 1747. He communicated his discovery to Benjamin Franklin, who, in his letter of September 1 in that year to Mr. Peter Collinson, F.R.S., was the first to publish it to the world. It suggested to Franklin his lightning-rod, which the inventor made known in 1752, and which the European *savants* explained, in accordance with scientific theories then current, as a conductor of a supposed “electric fluid” darting from the clouds into the earth. They practically ignored original conception of it as an electric tap, as did the proverbially practical Franklin himself, who never troubled himself about the theory of his invention.

Passing to the precautions necessary in regard to chimneys, Colonel Parnell insisted that, as in the instance of the metals, the best plan theoretically was for buildings to be erected without them. But chimneys being a necessary evil, the endeavour must be to render them as nugatory as possible, and to deprive them, so to speak, of their sting, by tapping the ground beneath them of its superfluous electricity. To this end he suggested (1) that the metal-work on the lowest floor should be connected to the soil below by means of two iron bands, one at each side, securely rivetted to the foot of the grate's front and passing down through the hearthstone and the rubbish or concrete underneath about a foot into the actual soil. (2) It was proper to fix securely and closely to the top bar of the grate two iron spikes 3 inches long, one at each side, close to the cheek of the fireplace, and leaning back obliquely towards the flue at an angle of 45 degrees. The spikes should be very sharply pointed with steel, and should be always kept sharp.

In conclusion, Colonel Parnell urged architects to make the study of the physics of lightning-strokes a part of their professional business. There seemed to be no reason why they should not. The known laws of electro-statics were of the simplest kind, and their comprehension did not involve a tithe of the mathematical knowledge needed in studying mechanical science. Enough knowledge of lightning-strokes to enable an architect to safeguard a building against them was easily learnt from nature alone. It did not belong to the electrical engineer, whose province was artificial electricity. The defence of life and property from lightning seemed to rest on the labours of three classes of scientific men. The first were the meteorologists, who observed the phenomena of thunderstorms. Next came the physicists, who reasoned on the facts, and eventually deduced therefrom theories and laws. Lastly, architects practically to apply the reasonings of the physicists.

Mr. SYMONS said he had not expected to be called on to speak, and remarked on the lateness of the hour. He then went into the subject of Colonel Parnell's paper at length. The paper, he said, had almost taken away his breath, and he had begun to wonder whether we had not suddenly gone back a century. Mr. Symons next went through a long list of buildings that had been struck and injured by lightning where conductors had been fixed, and the purport of his remarks was to show that in every case something had been faulty and defective with the conductors or the earth connections.

Professor ADAMS followed the same line of argument, and quoted statistics which he considered sufficiently showed the value of lightning conductors as safeguards from injury or damage by lightning. It was to be borne in mind that electricity always chose the path that offered the least resistance, and that if conductors were not so carried as to provide the easiest path, the

electric current would leave the conductor and not improbably do damage.

Professor HUGHES said the paper was like a long list of shipwrecks caused by rudders or safety valves. When the matter, however, came to be analysed, the truth was found to be that the rudders and safety valves were not in proper order. A conductor should always afford the shortest path for the electric current, and in the next place there must be a proper earth connection, often a matter of some difficulty to get. Earth plates no doubt were costly, but they really ought to cost more than conductors. If all proper precautions were taken he did not think it was possible for lightning to injure a building.

Mr. SLATER proposed a vote of thanks to Colonel Parnell for his paper. That gentleman had been considerably sat on by the previous speakers; but he (Mr. Slater) thought that, whatever their opinions might be, and considering they were only on the threshold as regarded their knowledge of the subject, that they ought to be much obliged to Colonel Parnell for having brought the paper before them. In the course of his remarks, Mr. Slater adverted to the danger that lightning, when traversing the eaves' gutters, would jump to the ground at the angles of the building rather than pass sharp round the corners. It seemed to him that connections should be formed at all angles, and this could be done by carrying down the gutter pipes at the corners of the building.

Mr. VYLE having made some remarks, the vote of thanks was unanimously passed to Colonel Parnell.

Colonel PARNELL, in reply, said he could not expect views which departed from the usual beaten track to be taken up with alacrity. He was thankful for the criticism his paper had met with, which was far more preferable than having it hushed up with faint praise. At the same time, he reminded his audience that they had heard next to nothing of his paper. He had quoted no authorities in support of his opinions and deductions, but they must not think there were none. He had approached the subject as a student, and his studies had been made from the transactions, data, &c., furnished by electricians, &c. What he would ask them was to carefully read through his paper, and then form their own opinion on the evidence laid before them.

Professor KERR asked if the members might expect to have the paper printed and in their hands about the month of July.

The SECRETARY replied that it would be issued in April.

Professor KERR having made a remark showing that he did not appreciate the wisdom of keeping papers from the members till everybody had forgotten all about them, the proceedings terminated.

## THE VENTILATION OF BUILDINGS.

A MEETING of the architectural section of the Glasgow Philosophical Society was held on Monday night, when Mr. W. F. Salmon read a paper entitled “Some Observations on the Ventilation of Buildings.” He said that if the public looked to any as guides in this manner it was to architects, and that very properly, for every building had its peculiarities of site and construction, with which the architect only was fully conversant, and without his aid a specialist in ventilation could not be expected to deal with the matter. Of late many inventors had produced curiously-shaped and cunningly-devised contrivances to extract foul air from enclosed places, but he was going to endeavour to show that the leading principle in all of them was known and understood before the dawn of the present century. He believed that if a record of their plans was kept by architects, along with notes of their experience of them, after due trial they might look forward with more hopefulness into the future, and calculate, ere long, on receiving good ventilation. Proceeding to consider the principal divisions of the subject—(1), the admission of fresh air; and (2), the extraction of vitiated air—Mr. Salmon quoted a series of interesting extracts from the leading authorities on ventilation, and pointed out that it was quite possible for them to make a wrong use of scientific data. Science and practice were two distinct things, and the sooner this was recognised in the matter of ventilation the better. A series of diagrams and plans having been shown and explained illustrative of several systems of ventilation, he said that if once it was known that the architects were in earnest about the matter, and were step by step mastering the difficulties with which it was beset, the public would support them, and with great willingness pay for a supply of fresh air. But, in the meantime, they were only on the threshold of the subject, chiefly, he believed, on account of want of authenticated tabulated statements of results. After a discussion on the paper had taken place, Mr. Salmon was awarded a vote of thanks.

Mr. F. J. Furnivall has been granted a pension of 150*l.* a year, in recognition of his researches in old English literature. As founder and director of the Chaucer Society and the New Shakespeare Society, and as a worker for the Early English Text Society and other bodies, Mr. Furnivall's labours have been long, arduous, and unremunerative, and the announcement of his pension will be generally welcomed by students.

## NOTES AND COMMENTS.

THE Office of Works has set the praiseworthy example of inaugurating important public works without the customary orations of mutual admirers. On Monday last the Prince and Princess of WALES opened the triumphal arch which used to carry the Wellington statue, and is now set up in another position. The occasion was, so, to speak, a recognition of the improvements which have been carried out at the instance of the First Commissioner of Works. But the simplicity of the ceremony could not be surpassed. The gates were closed by the police inspector, who regulates the traffic, to enable the Prince and Princess to hear a short account of what had been done. The officials and contractors were introduced, a few gracious words were spoken, then the gates were opened, and without flourish of trumpets or subsequent dinners or speeches, an important work was dedicated to public use. The re-erection of the arch has been carefully completed, and there are few signs of patching visible even on the shafts of the columns. But it is a pity that the opportunity was not taken to re-dress the ashlar near the pilasters of the front. The tooling is disgraceful and is now more apparent than formerly. It would also be an advantage if the massive gates had been painted a better colour, and partly gilded.

WE trust that the Metropolitan Board of Works will not allow Sir JOHN STEELL'S statue of ROBERT BURNS to be fixed on the Thames Embankment until the opinion of qualified persons on the merits of the work has been obtained. It is understood that the statue, which is now being cast in Edinburgh, is a copy of the figure by Sir JOHN STEELL which has been placed opposite the Albert Institute in Dundee, and which is a replica of one in New York. If so, we need not hesitate to say that, defective as are so many of the London statues, there is not one among them having so ungainly an appearance as that figure. It is said that the sculptor has revised the design, but with so unfortunate a pose no revision will make the statue presentable, or convert contortion into beauty. Sir JOHN STEELL has produced most excellent works in his time, especially equestrian figures; but as HOMER sometimes nods, great artists occasionally fail, and there is no use that we can see in again and again reproducing their failures. BURNS is one of the last men of whom an effigy should be set up for public derision in an English thoroughfare. BRUNEL'S statue on the Embankment is quite enough, without a companion to suggest the decline of the sculptor's art in Great Britain. Let Sir JOHN STEELL be commissioned to make an entirely new figure, if London must have its statue of the poet, but let BURNS, and not a stump of a tree, have most prominence.

THE gallery of casts will be a valuable addition to the South Kensington Museum. It adjoins the new gallery containing Indian and other textiles, and in height it corresponds with the Architectural Court. At present this part of the Museum is closed in the evenings, as provision has not been made for artificial lighting. But in the day-time there is no want of light in the sculpture gallery, and the details of the casts are to be seen most closely. The walls are coloured an orange red, against which the white casts stand out well. There is a gallery around the court, the front of which will be made up of metopes from the Parthenon and other temples, placed continuously; and above on the walls will be some of the older examples of work in relief, including the best of those discovered in the German excavations. The Parthenon frieze has an important position on the lower part of the walls. All the casts of statues have been carefully made, and the extreme whiteness will probably be an advantage in the eyes of the general public. There are a few niches in which the principal figures will be placed. It would be premature to give an opinion on the selection, as the works are not yet arranged; but from what we saw it appears to have been guided by judgment, although some archæologists will wish for more of the archaic figures.

THE last volume of the "Transactions of the Institute of British Architects" has been the subject of a long article in the *Literarische Rundschau* (published at Würzburg) by the well-known Dr. A. REICHENSBERGER, of Cologne, member of the Imperial German Reichstag, and who is also a foreign member of the Institute. The learned Doctor remarks that the Insti-

tute is a fine example of what voluntary activity can effect, and that the noble profession still flourishes in England, as it appears to have done in the Middle Ages, without the aid of any State department with an army of costly and officious functionaries. This is evidently a hit at the system in force in Germany, where an architect who does not care to limit his sphere of action to designing and directing his own private building operations, is compelled to undergo a great loss of time and energy, in going through an almost useless State examination before he is permitted to compete in designing public or other buildings which may be openly contested for. Dr. REICHENSBERGER gives lengthy extracts from some of the leading papers, with a summary of the work of the Institute, and dwells with some feeling on the very different practice prevailing in this country, where every professor of the art is free to enter into competition for the greatest building projects. The Doctor concludes with the hope that his review will not only be valuable for the information it diffuses, but that it will be an incentive to introduce in his country the benefit which the Royal Institute is supposed to be to architects in England.

THE new picture *Anno Domini* has received a larger share of adverse criticism than it deserves. It was meant to be a popular picture, and it well attains that end. Mr. LONG is not skilful in depicting emotions, and he has wisely arranged the figures in a way that gives scope for the representation of the graceful figures and handsome faces of a vast number of girls. We see a long-winding procession from an Egyptian temple, with dancers in the front. As the idols pass, the few people who are on the route kneel in worship, but their faces are not to be seen. In some mysterious way the Holy Family, with their ass, have been allowed to pass through the procession or across it—a feat which would be difficult on such an occasion—and form the middle part of the foreground. The importance of the group is apparent at the first glance, and it is evident that great care has been taken in the painting. The group deserves to be made the subject for a special engraving. The figures have dignity and gentleness combined, and appear to pass on their way without a thought of the pageant that is near them. If this group had been painted by a foreign artist it would have secured universal applause. In the left corner a negro is seen selling small idols and charms. Close to him are a woman with a sick child, a girl who allows her lover to present her with a necklace, and some other figures. With the exception of the crying woman there is not a part of the picture on which the eye cannot rest with pleasure, and, considering the large size of the canvas, this is saying much.

THE church of St. Lawrence, Appleby, contains an old tomb at the east end, which is known as the Countess of CUMBERLAND'S Tomb. It was erected at a time when great people cared less for public rights in a church than they do now, and it has stood in the way of all improvement of the building. Over twenty years ago, when the church was restored, Mr. CHRISTIAN wished to have the tomb removed, but the lord of the manor would not consent. It has been allowed to fall into ruin, although in 1656 the Countess-Dowager of PEMBROKE provided a fund for the conservation, and the fund is now supposed to produce about 80% a-year. Once again it is proposed to interfere with the tomb, and to remove it to the east end of the north chancel aisle. But some of the descendants of the Countess oppose the proposal, on the ground that by law there can be no removal without their consent. The case has been heard before the Chancellor of CARLISLE, and the decision has been postponed until February 20.

ACCORDING to the report of Captain SHAW there has been during 1883 an increase of 218 fires over the number for last year, and, compared with the average of the last ten years, the increase was 446. It will suggest the work of the Fire Brigade when it is stated that the journeys made in 1883 by the fire-engines of the fifty-five land stations have amounted to 29,850 miles, and the total distance run has been 67,850 miles. The quantity of water that was used was 29,000,000 gallons, or about 130,000 tons, nearly one-half of which was taken from the street pipes. Captain SHAW acknowledges that the work of the year was very severe, but his men have exerted themselves with zeal and goodwill.

## ILLUSTRATIONS.

ST. MARIE'S-ON-THE-SEA, HOLME HILL, GREAT GRIMSBY.

THIS church, the erection of which is owing to the munificence of Mr. T. A. YOUNG, K.S.G., Lord of the Manor of Kingerby, was commenced in the autumn of 1879, and solemnly opened by the Lord Bishop of NOTTINGHAM in August last. The western front and steeple with two bays of the nave are still incomplete, but it is hoped they may be erected at no distant period. The plan comprises a nave and aisles under one roof, 50 feet wide and 50 feet high to the top of the panelled ceiling, having high side-lights; the altar-platform raised nine steps above the nave, and the eastern window of five lights treated as a Jesse window, raised 25 feet above the nave level. This arrangement forms a portion of the design of the altar and reredos. The latter is of wood, entirely gilded like the old Spanish retables, and filled with an interesting series of paintings by Mr. WESTLAKE, and placed against the eastern wall, the altar and throne being well advanced forward. At the eastern termination of the north aisle is the founder's chantry chapel and vault, and the sacristy with organ tribune over and presbytery are to the south.

The building is constructed of fine red brick with a sparing use of Yorkshire stone, and the west front when completed will have a saddle-back tower and spire, covered with lead and Westmoreland slates, 200 feet high. The chancel is marked externally by a fleche of slate and lead-work rising 50 feet above the ridge, and contains a bell of a ton weight, supplied by TAYLOR, of Loughborough, with the old Lincolnshire legend, "Quod audisti in aure O Maria predicabo super tecta." Messrs. HADFIELD & SON, of Sheffield, are the architects, the contractors being Messrs. RIGGALL & HEWINS and Mr. J. G. SMITH, both of Great Grimsby. The church is warmed on HADEN's principle, and the chancel tile floors are by Mr. GODWIN, of Hereford.

CENTRAL OFFICES FOR THE CHELTENHAM GAS COMPANY.

THIS building is now in course of erection at the corner of North Street and Albion Street, Cheltenham, from designs selected in public competition. It comprises general office, managers and cashiers' offices, board and committee rooms, a large proprietors' room for the meetings of shareholders, and a cashier's residence. The front is faced with Corsham Down Bath stone, and Box ground stone weatherings. The principal rooms will be fitted with oak. The work is being carried out by Mr. THOMAS COLLINS, of Tewkesbury, under the superintendence of Mr. JOHN G. DUNN, A.R.I.B.A., of Birmingham, architect.

DESIGN FOR WAREHOUSE, GLASGOW.

THIS is a design, prepared by Mr. ALEXANDER SKIRVING, I.A., for an extensive furniture warehouse, and is a good example of a commercial building designed for utility, the chief object in which is to obtain the greatest amount of light combined with a pleasing architectural elevation. The style is refined, partaking somewhat of the Byzantine type, as shown in the arches and domical roofs at the corner. Although the horizontal lines predominate, the manner in which the pilasters are carried into the other flats gives variety and dignity to the edifice.

WROUGHT IRONWORK.

THE figures which appear in this illustration are referred to in the lecture by Mr. C. S. SMITH, A.R.I.B.A., published this week.

## THE NEW ART GALLERY, WOLVERHAMPTON.

THE new Art Gallery and Museum which have been presented to the town by an anonymous donor at a cost of over 5,000*l.*, and which have been erected in New Lichfield Street, on land given by the Corporation, are now nearly complete. The site is an excellent one, being in the centre of the town, and close to the fine collegiate church of St. Peter, which the gallery faces on one side. The buildings are of Classic design, executed in Bath stone. The frontage in Lichfield Street is 90 feet, and in St. Peter's Close 66 feet. There are two storeys, and the approach is by a flight of steps in Lichfield Street, beneath a portico, supported by six monolith red granite columns. There are also four detached similar columns above the portico, which are placed two on either

side of the folding glass doors which open out of the picture gallery on to a stone balcony. The façades are of two orders of architecture, the Doric being employed for the ground-floor storey, and the Ionic for the storey above. The ground-floor is to be devoted to the museum, which is lighted by large windows opening on to Lichfield Street and St. Peter's Close. The upper storey is to be devoted to the picture galleries, which will be lighted from the roof, and have a covered ceiling. The front of this storey and the side facing St. Peter's Church, instead of being pierced by windows has been filled in with handsome sculptured panels executed in Portland stone, with figures in bold relief, representing in Lichfield Street painting and sculpture, and in the Close science. These are the work of Mr. Boulton, of Cheltenham. At the terminals of the façades of the building deeply-recessed niches have been introduced, suitable for the reception of statues. Entering the building through a vestibule, and passing the cloak rooms, the large entrance hall is reached, on three sides of which are the rooms for the art museum—together 152 feet long. A fine stone staircase opens out of the hall and leads to the galleries, consisting of a suite of rooms, altogether 176 feet long. The rooms are so arranged that visitors can easily pass from one to the other. The building has been erected from designs and under the superintendence of Mr. Chatwin, architect, of Birmingham, and the builders are Messrs. Philip Horsman & Co., of Wolverhampton. Adjoining the Art Gallery, in the St. Peter's Close, there is to be erected a School of Art, at a cost also of 5,000*l.*, to supersede the present building in Darlington Street; 2,000*l.* have been raised by the sale of the present building, and almost the whole of the remaining 3,000*l.* has been subscribed. The school will correspond in outward design and character in every respect with the art gallery, and it will occupy the remaining portion of the total site of 1,500 square yards which was voted for the two buildings by the Corporation. It will have a frontage on St. Peter's Close of 87 feet, so that the total length of the façade on that side of the two buildings when completed will be 153 feet. The entrance will be in the Close, and the rooms on the second storey will be so arranged that on particular occasions they can be entered from the art gallery, and, with the rooms of the latter building, will form altogether a suite of rooms on that floor over 300 feet long. The work of demolishing the old buildings on the site and of getting out the foundations has been already begun. The art gallery will be opened in May in connection with the Industrial Exhibition. Mr. Chatwin is the architect, and Messrs. Horsman & Co. the builders.

## LYCIAN ART.

IN the third lecture of his University College course on "Monuments of Lycian Art," Professor Newton described the Ionic building at Xanthus, commonly known as the Nereid monument, the sculptural remains of which are in the Lycian Room at the British Museum. It was situated on a small eminence nearly half a mile to the east of the Acropolis at Xanthus. When first discovered by Sir C. Fellows nothing remained in position but the base on which the edifice stood. The architectural members and sculptural decorations were found lying strewn about on the ground below the base, having probably been thrown down by an earthquake. The study of these remains, after they had been sent to England, enabled Sir C. Fellows to reconstruct the edifice, and the result of this reconstruction may be seen in a model which he presented to the British Museum, and which stands in the Lycian Room. The edifice, which was built of white marble, consisted of a lofty pedestal or base, surmounted by a temple-like structure, supported by Ionic columns and richly adorned with sculptures, some in relief and others in the round. Within the colonnade was the cella, round the outer walls of which ran a narrow frieze. Above the colonnade was another frieze, which seems to have served also as an architrave, as no remains of that member were found. On the base were two other friezes, one immediately below the cornice which crowned it, the other on a larger scale below. The position of the columns was determined by sinkings in the stylobate at regular intervals; intervening sinkings marked the position of statues placed between the columns, of which the arrangement was what Greek architects called *araistyle*—that is to say, with very wide intervals. The statues all represented Nereids in rapid motion, each with some marine creature at her feet as an emblem. Of the two friezes round the base, the larger one represented a battle scene, apparently between Greeks and Asiatics, mounted or on foot; on the smaller frieze was the siege and capture of a city told in successive scenes. On the frieze above the columns the subjects were a hunting scene; a battle between warriors, some mounted, some on foot; a procession of figures bringing presents, intermixed with groups of figures conversing. On the frieze round the cella were a sacrifice and a banquet. In one of the two pediments they had a battle between horse and foot; in the other, a composition in which there were in the centre two seated figures, and at the sides smaller figures. On the apex of either pediment, Professor Newton thought there might have been a group of two figures in the round, not at the two corners where Fellows placed them. If they

considered the sculptural decorations as a whole they might assume that the edifice which they adorned was not a trophy, as Sir C. Fellows had designated it, but a sepulchral monument, such as the Greeks called heroon. Taking this for granted, they might further assume that the sculptures had reference to one personage, to his warlike exploits and other doings in life, and probably to the worship accorded to him after death. The greater part of these sculptures might be regarded as historical rather than mythical, realistic rather than ideal. Realism was strikingly shown in the siege of the city on one of the friezes of the base. If they adopted the arrangements proposed by Michaelis in his excellent memoir in the *Annali of the Roman Archaeological Institute* for 1875, the first scene was a battle in the plain outside the walls; then came an attack on a gate, against which the besiegers were placing a scaling ladder. Next was the blockade of the city, which seemed about to terminate in a capitulation, indicated by a group outside one of the gates. The last scene represented the capture of the city. A long line of walls, probably of the Acropolis, nearly denuded of defenders, showed that the city had surrendered. On the following scene a noted personage, whose parasol denoted his superior rank, was receiving the submission of the vanquished. If they turned to the statues in the round they found that the movements of the Nereids between the columns were marked by extreme agitation, as if they were perturbed by some great event. The general action of these figures was very spirited, but the modelling of the figures and the composition of the drapery were very unequal. The same observation applied to the friezes, of which the composition was throughout far superior to the execution. The study of the style of these sculptures brought them to the question of their date. Some archaeologists had placed them in the latter half of the fifth century B.C., others early in the fourth. The siege represented on the frieze had been thought to commemorate the capture of Telmessus (Makri) by Pericles, King of the Lycians, which was recorded in a fragment of the historian Theopompus. If they might venture to identify this Pericles with the Pericles whose name they found on Lycian coins, not earlier than B.C. 360, they then obtained a date for the capture of Telmessus, and if that was the event represented on the heroon, the Nereids must be taken as a figurative representation of the Gulf of Glaucus, now the Bay of Makri, on which Telmessus was situated. This conjectural interpretation of the Nereids the lecturer deemed not unworthy of consideration.

### THE HOUSE OF THE VESTALS, ROME.

THE correspondent of the *Times* in Rome has prepared a plan showing the arrangement of the House of the Vestals in the Forum, and the position in which some of the antiquities stood when revealed. The three inscribed pedestals of statues of the Vestals, discovered on November 5 last, stand at A. From them the portico of the atrium extends, as will be seen, direct to the tablinum B and its contiguous chambers, turns there at right angles and at equal distance in front of them, and returns along the other side. This portico was formed in front of the tablinum by six columns, counting the corner ones, and along each side by more than nineteen, the number of foundation-stones (cushions) thus far discovered *in situ* on the north-east side; and, from the remains of a slender shaft of richly-veined breccia corallina marble found within the area and corresponding in proportion to the basements, it may be conjectured that the columns were of that beautiful material. The pedestals of the columns were connected by a low wall balustrade of about 2 feet in height, faced with marble. The pavement of the portico was formed of slabs of richly-coloured marbles, of which the portion in front of the tablinum is almost intact; the wall of enclosure was panelled with marble throughout, and against it were placed the statues of the Vestales Maximæ on the pedestals which have now been found and on many others, of which fourteen were discovered here in the fifteenth and sixteenth centuries. That these statues stood along the walls is proved by the discovery of the basement stones of some of their pedestals at C, C, C. The fourth pedestal discovered in the course of the present excavations was found at D, and still stands leaning against the front wall of the tablinum, more or less in the position it occupied, but it had been moved from its place. A fifth pedestal has quite recently been discovered standing against the south-west wall of the portico of the atrium at W. The central area of the atrium is paved with black mosaic. At the upper end of this area at the distance of seven metres and a half from the steps leading into the tablinum, there is a cavity about four metres square and a metre in depth, lined with slabs of coloured marble at the bottom and on the sides, and bordered by a wall of about a foot in height, coated externally with marble. Only one corner of the interior of this cavity has yet been cleared of the *débris* within it. The mosaic pavement of the area between this curious cavity and the line of the columns of the portico in front of the tablinum is different from the rest, and apparently formed of white tesserae only. This sumptuous portico—a cloister of ancient days, along which it requires but little imagination to picture the Vestals

themselves, those who had passed their twentieth year of service teaching the rites to those who had not reached their tenth, and those between their tenth and twentieth passing to and fro, attentive to their sacred duties—gave direct communication between the House and the Temple; for while writing this another basement stone of a column has been found in its place at F, on the further side, from the House, of the three pedestals at A, and, as the plan will show, it is evident that the portico continued on to the Temple, of which the wreck of the podium is marked at K, the full length of the portico being no less than 71 metres.

The walls of the tablinum B, which measures 12.65 metres by 8.50, were panelled with different sorts of richly-coloured marble, with mouldings of rosso antico, and its flooring was laid with materials of the same kind arranged in geometric designs. Considerable remains of the marble pavement and of the lower part of the wall decoration have been found *in situ*. From the tablinum there open three rooms on each side, each measuring about four metres by four and a half. The vaulted ceilings of these rooms are entire, but all traces of their decorations have disappeared. Below the flooring of the middle room on the right a number of large, round amphoræ were found, cut in two horizontally and placed with their mouths and bottoms upwards, evidently for the

purpose of preventing damp—to which the House must have been much subject, for its south-west wall is built against the side of the Palatine, and along the line of the Nova Via, the pavement of which is 12 metres higher than the level of the atrium and the ground floor of the House. On one side of the tablinum and the rooms connected with it are two large chambers, and on the other one, each of them corresponding with it in length but somewhat narrower. Behind these chambers there extends a series of narrow rooms forming an irregular corridor, but this posterior portion of the building has not been sufficiently cleared to show how it was communicated with from the rest of the House. The vaultings of these narrow rooms, or this corridor, are intact, and above them the mosaic pavements of the upper storey. Beyond the wall of the south-west side of the atrium there runs a kind of passage or corridor, H, of rather more than 3 metres in width, from which a series of long rooms, M, M, M, open. In this corridor there are a few traces of encaustic painting. At O there is a staircase leading up to the first floor, which is intact everywhere excepting over the tablinum and the two of the chambers on each side of it, marked P, and over the corridor H. On this upper floor there are considerable remains of the Vestals' bath-rooms; some, as at R, lined with marble for washing, and others with suspended floors and walls surrounded with *caloriferes* for the hot-air bath. The south-west half of the atrium and its portico on that side have still to be cleared, and the continuation of the excavations will show how far the south-west wing of the House reaches beyond the rooms marked M.

The first of the Vestal Virgins named by Numa—Gegania, Verenia, Canuleia, and Tarpeia—resided in apartments assigned to them in the Regia. Their number, originally four, was increased to six by Tarquinius Priscus and later on, according to some authorities, to as many as twenty. When Augustus removed the residence of the Pontifex Maximus to his new Domus on the Palatine, he gave the Regia to the Vestals. That building, of which considerable traces were found in the excavations in 1879 and 1882, was destroyed in the great Neronian conflagration, and immediately afterwards rebuilt, but not exactly on the same spot. The new arrangements of the streets necessitated a slight change to the south-west in the position of the Vestals' atrium and House. In the time of Commodus the Temple and the House were again destroyed by fire, 191 A.D., at the same time when the Temple of Peace and many of the finest edifices of the city were burnt. The flames spread with such rapidity that the Vestals, in order to save the Palladium, were compelled to carry it openly across the Sacra Via, when Herodian narrates it was seen openly for the first time after it was brought to Italy from Troy. The remains, therefore, now being disinterred are those of the House and atrium as rebuilt, or, at any rate, as restored, after the fire in 191 A.D., by Septimius Severus, but, in the course of the works, still incomplete, just between the three pedestals at A, and the remains of the podium of the Temple of Vesta, K, a mosaic pavement—perfect as far as it has been uncovered—of the Republican period, and corresponding exactly to some of the pavements of the Regia, has been found at R, at the depth of about a mètre below the level of the portico of the atrium now discovered, and it is probable that this may prove to be part of the pavement of the earlier atrium destroyed in the conflagration A.D. 65.

### CARVED WOODWORK.\*

ONE of the most difficult things to do at present is apparently to be impartial in dealing with work belonging to any time between the sixteenth and nineteenth centuries. It was far from being the most memorable period of art, but just now there is a tendency to exalt its productions to a level with what was done long ago in Greece or Italy. For some men

There is a consecrating power in Time,  
And what is grey with years to them is godlike,

and of this disposition of mind Mr. Saunders' book is a proof. One of the illustrations in it suggests that he himself could design woodwork in a better style than the old examples he selects, and, among his long list of subscribers, we find names of men who, if they tried, could not produce things so bad as some of the furniture in the book. But whatever may be the origin of this sentimental regard for carved oak woodwork of the sixteenth and seventeenth centuries, there are plenty of people who are willing to pay a high price for examples and for drawings of examples. It is a pity to see such good drawing, good paper, and good binding as we have in this volume expended on a subject like that selected by Mr. Saunders. The objects which are drawn are no doubt mainly the work of English hands, and if they were published with a view of indicating the condition of art in this country at one time, we could no more cavil at their appearance than at the specimens of bad spelling and bad grammar which are occasionally given by historians to suggest the state of education at a certain period. But Mr. Saunders claims artistic as well as historic interest for his specimens of the handiwork of village Quinces and Snugs. Mr. Ruskin examined the original drawings; and although he is easily pleased with anything that does not belong to our mechanical age, yet he was compelled to say that the examples were "not in harmony with the precepts of the best masters in wood-carving." It would be probably nearer the truth to say that fourth-rate masters would disown such work. Mr. Saunders is, however, enthralled by the style, and would have us believe in the "earnest spirit and simplicity of aim shown in the execution of the work of that period," the "integrity of purpose," the "simple and effective ornamentation," and other virtues. But, while admitting that there was no stint of materials in those days, and that the work is constructed so as to endure, we do not believe that it has any claim to be considered artistic. The substantial character of old English work is so generally acknowledged, there is no need to undervalue modern work in order that seventeenth-century carpenters may be exalted. When Mr. Saunders says that genuine and simple principles of good workmanship appear to be now "too much ignored or wholly lost sight of," he is unjust towards his contemporaries. There would be no difficulty in finding in London, or in any of the large provincial towns, specimens of the carpenter's and cabinet-maker's skill that bids fair to last for centuries. It is true that work is turned out which is the reverse; but the sixteenth and seven-

teenth centuries also recognised the fact that some people are more likely to be attracted by what is showy and cheap, and provision must be made accordingly. It is only the best specimens of the work that have survived. Even Mr. Saunders is forced to admit that Time has not been conquered without the expenditure of an enormous mass of material. Speaking of houses, he says:—"The timbers were often of extraordinary and apparently unnecessary length. This was, no doubt, partly owing to the ease with which large pieces of timber could then be obtained, and partly to the fact that it was cheaper to use it in larger sizes than to cut it into smaller ones." We cannot bring back those happy days when oak trees were inviting passers by to come and cut them down, and we have therefore to be thrifty in the use of timber. We may not be able to have unwieldy pillars to support a slight weight, or dining-tables that seem better fitted by their size and structure for the operations of an abattoir, or chairs that would sustain a performing elephant (and to lovers of the grand old English furniture nothing atones for absence of quantity); but in spite of circumstances it is still possible to get furniture which we may use for sitting, dining, and sleeping without any risk of accident. There may be some security in the big chests which Mr. Saunders represents, yet after all a bank is a safer place to keep money, and for a tired man of business an iron bedstead is more comfortable and healthier than the "sixteen post" oak bedsteads at Bladon Castle and Buxton, which seem admirably adapted for the creation of nightmares.

The simple, effective ornamentation which Mr. Saunders admires is a very mechanical affair. The first and last principle appears to have been that a surface to be ornamented must be entirely covered, no matter how often a form was repeated. Everything was to be uniformly stiff, whether it was a copy of an Ionic volute, a leaf, a flower, the human figure, or an angel. There is not a line among all the plates in the book which suggests that the old oak carvers had any more knowledge of what grows in fields and gardens than the men about Shoreditch who now produce, by the thousand, without any variation of form, the floriated brackets which are stuck on cheap furniture. How an Indian carver, who toils for a penny a day, would be amazed if he saw those forms and heard of the idolatry which surrounds them!

### LEICESTER SOCIETY OF ARCHITECTS.

THE eleventh annual meeting of this society was held on January 22, when the following officers were elected for the year 1884:—President, Mr. W. Jackson; honorary secretary, Mr. A. H. Paget; council, Mr. R. J. Goodacre, Mr. Joseph Goddard, Mr. W. Millican, Mr. J. B. Everard.

In the course of his address the President made the following remarks with reference to a recently advertised competition:—There is one subject which is probably uppermost in your minds, and which will not come before you in the report. The report deals, of course, with events and proceedings of the past year, and the question of architectural competitions has but recently been forced upon your notice. Upon it I must be allowed to make a few remarks. Some years ago it was generally believed that if a man, or a society of men, wanted to get the most work out of an architect for the least money, the most effectual way was to go in for an open competition. It was believed that all that was requisite was to draw up a set of absurd conditions, and advertise them with a bait of twenty or thirty pounds, in order to catch any number of architects as in a net—a net spread in the sight of all men. Experience soon proved, moreover, the inutility of such proceedings, not only from the point of view of the architects, but from that of the employers themselves. Open competition was found very often to degenerate into a scramble, and to develop work which was showy and superficial rather than good; and, as a matter of fact, open competition, except in special cases and under well-ordered conditions, has already ceased to be the rule. But the old ideas still linger—as old ideas are apt to do, from ignorance or prejudice—in certain places; and thus, from time to time, we are surprised by a publicly-advertised competition which revives the worst traditions of the past. The principle laid down by the Institute is perfectly clear. The actual and final competition should be limited, and each competitor should be paid for his work; the drawings should not be more in number, or to a larger scale, than is necessary to explain clearly the design; there should be no playing fast and loose with the author of the premiated design; and there should be a properly-qualified judge.

Now, with respect to a competition recently advertised by the Town Council of Leicester, and which your council does not consider satisfactory, you will observe that the above conditions, which have been drawn up and sanctioned by the Institute after a long and careful study of the subject, are not complied with; on the contrary, the selection of designs is entrusted to a sub-committee, who will report to the Estate Committee who, assisted if they see fit by a professional architect, will make selection of two designs for the Town Council, who will make the final de-

\* *Examples of Carved Oak Woodwork in the House and Furniture of the Sixteenth and Seventeenth Centuries.* By William Bliss Saunders, Architect. Bernard Quaritch.

cision, who will also reserve themselves full liberty of action with respect to all proceedings in connection with the proposed buildings, and are not bound by anything done under or in connection with the competition, except the payment of premiums. Some troublesome rights of light are involved with which intending competitors are instructed not to interfere, or render the Corporation liable for damage. Each design is to be drawn to a large scale, 6 feet to an inch, the sizes and heights to be marked in figures, and is to consist of a plan of each floor with sections, together with three elevations and a perspective view, accompanied by a written description, setting forth in detail the character of the material and workmanship, and an approximate estimate of the cost. The first premium of 25% is to merge in the commission, if the author of the premiated design is employed to carry out the work, and in that case the commission is to be considered as payment for all matters or things arising out of or connected with the erection and completion of the buildings. The premiated designs are to become the property of the Corporation, and the whole of the subsequent contract drawings and specifications are to be given into the possession and to become the property of the Corporation, who reserve the right to reject the whole or any of the designs if they should appear unsuitable or of too expensive a character.

### THE DECLINE OF ENGRAVING.

A LETTER has been addressed by the Fine Art Society to the *Times* in regard to the statement that fine engraving, whether in mezzotint or in line, is doomed. They say:—A principal cause for the decay of engraving lies in the miserable condition of the law of copyright, and the apathy of the Legislature, the artists, and the engravers, and the connivance of the public at the continual breaches of it, the consequence of which is that the whole land is now overrun with traders of the lowest class engaged in selling photographs of popular copyrights. No engraving of any interest has been published of late years, but it has at once been pirated with impunity. We say with "impunity," for the headquarters of the pirates are situated in the Channel Isles, where they cannot be touched; their goods are transmitted to England through the post, but the Post Office authorities (although the importation is prohibited by Act of Parliament) refuse to detain them; they are received by Jews living in the purlieus of Houndsditch, whose abode is well known, whence they are sent broadcast, by means of travellers, over the length and breadth of the land. But there is no power of search, no power to seize, even if the offenders are caught *flagrante delicto*, the only remedy being by summons to be served at and to be heard "in the district where the offending party resides." It is needless to say that these *chevaliers d'industrie* have no fixed place of abode. This evil is increasing at an enormous rate, and the publishers, while unable to check it, are suffering such losses therefrom that they hesitate to give large commissions to engravers, and naturally prefer processes which involve but little outlay. As an instance, during the past four years we have published six engravings, for the copyrights in which we paid over 7,000*l.*, and for the engraving over 10,000*l.* Within a month of their respective issue, photographs of them were hawked about at half a crown each.

The trade of these pirates would never have attained to the volume we have mentioned had they not received substantial support from the public. To the credit of the smaller dealers in works of art be it said, they have almost unanimously refused to countenance this robbery. But the public, who, by the way, have lately expended much righteous indignation upon the literary piracies of our Transatlantic brethren, see no harm in aiding what they know to be a wrong and a fraud.

The apathy of the artistic body as regards piracy is extraordinary. They have hardly stirred a finger to defend their rights, and consequently will, probably, in the near future, suffer grievously for their omission. It would be perfectly easy for any one so disposed to photograph unperceived every picture of note in the Academy Exhibition, and flood the market with copies within a fortnight of its opening. If such were done the value of artistic copyrights would tumble from hundreds to tens of pounds in a day.

Another cause for the decay of engraving is the length of time which places take to produce. As regards this, the engravers themselves are in a measure to blame. Work does not, perhaps, come so readily to many of them that they can refuse to accept a proffered commission; but the result is that months and years drag on without a plate being completed, until the interest therein is gone, and publishers are perforce driven to adopt in future speedier methods of reproduction.

There is yet one more reason for the decay of the art, and that is the gaps which are being year by year made in the ranks of the profession without any fresh men coming in to fill them up. Since the retirement of Mr. Cousins and the death of Mr. Holl, the number of able engravers may be counted on the fingers of one hand. There is undoubtedly at present no better opening for a young student of talent, mind, who will be content with an uneventful life, a fair income, and an almost certain place among the

Academic body, than that of one who takes up engraving, whether line, mezzotint, or mixed. We do not believe that reproductive processes will be the final nail in the coffin of engraving, and we speak as the publishers of Sir F. Leighton's *Wedded*, the most successful reproduction yet issued. With the law of copyright amended, we are certain that for another generation, at least, there will be room for a larger number of able engravers than have formed the school at any time during this century. Mechanical work at present shows no sign of competing successfully with manual work accomplished by a real artist.

### STUDIES IN ARCHITECTURAL STYLE.\*

IN this volume Mr. Pullan has brought together a large number of the designs prepared by him during a period of forty years. The variety suggests not only the range of the author's studies and capacity to treat several styles, but also the transformations of architectural taste. We have designs which belong to a time when England was supposed to be enthusiastic about Mediæval forms, and everyone was expected to cry out with Jonathan Oldbuck, "Gothic! Gothic! I'll go to the death upon it." There was to be one universal language in art, and all things were to be expressed in it and in it alone. The spirit of that time is to be seen in Mr. Pullan's design for the decoration of the Queen's Robing-room in the Houses of Parliament, which is one of his earliest works. Here we have the pedigree of the House of Hanover traced back to William the Conqueror, and displayed in the true Perpendicular style. But it was also proposed to depict "the most important events of each dynasty" in the same style, and thus the *Landing at Hastings* and the *Passing of the Reform Act* would, we suppose, from their uniformity of treatment, present the appearance of events that occurred within one period. It was like a return to the system of æsthetics which prevailed before Benjamin West painted the *Death of General Wolfe*, and when the laws of taste enjoined that in a historical picture, no matter whence the subject was derived, all the figures should be clad in Roman robes.

It was soon found that the world would not put up with one style, and Mr. Pullan, like many another modern Goth, was compelled to recognise the fact that there were good buildings before the rise of Mediævalism, and that when it declined the art of architecture contrived to survive. Accordingly we perceive that since 1857 Mr. Pullan has sought public favour with designs in the Italian Renaissance, French Renaissance, English Renaissance, Italian, Palladian, and Neo-Greek, as well as with the more ancient Romanesque, Byzantine, and Lombardic styles. Could there be a better comment on the restlessness and eclecticism of the age?

It is a hazardous undertaking for one man to attempt so much. But it should not be forgotten that Mr. Pullan has had better opportunities than any architect of our time to study all those types of building *in situ*. His knowledge has been gained, not by occasional and hurried scampers through a few foreign cities, but by long years of residence abroad. If there is any advantage in travel it should surely be seen in Mr. Pullan's designs.

It is very difficult to assess the value of the studies. However opinion may be divided about the merit of the designs, every one would agree that justice has not been done to them by the original draughtsmanship or by the reproductions. We do not remember a case which is a stronger testimony to the advantage of experts in drawing. If Mr. Pullan had obtained the services of some one to prepare his designs for publication, they would be more assured of success. One or two examples will prove this. There is a plate of thirteenth-century churches, which, as the author says, "shows the various forms which were most common at that period." If a good draughtsman copied this plate on a large scale it would, with little or no alteration, make a picture that would be more effective than anything of the kind by Augustus Pugin, and it might form a companion to the corresponding drawing of Cockerell, illustrative of Classic art. But in Mr. Pullan's there is very little effect. How much the designs can gain or lose by the style of drawing will be also seen from a comparison between Mr. Pullan's design for the decoration of a chancel arch of a Renaissance church, and his design for a portion of the dome of St. Paul's. Of the two, the former is superior on the whole, but it is marred by the execution. Mr. Pullan once brought out a small pamphlet *apropos* of ritualistic difficulties concerning altars in church. It contained several sketches of different types of altars, which have been reproduced among the "Studies," but in their present form they are little more than mere blots. Mr. Pullan, in becoming his own draughtsman, has been acting an unfriendly part towards himself. We need not say more on the subject.

The "Studies" are in truth valuable, and it is possible to utilise them with more advantage than the owner has done. Mr. Pullan's acquaintance with the best models has given a peculiar refinement to all his designs; and we fear that his want of success

\* *Studies in Architectural Style.* By R. J. Pullan, F.R.I.B.A. Published at 15 Buckingham Street, Strand.

has been often due to this quality. The quietness of his designs would be "nowhere" in a competition against works in which effect took the place of the Demosthenian action, and was the first, the second, and third consideration. Bentham somewhere refers to the case of Serjeant Maynard who, although a jurist in whose works a treasury of law is to be found, was never able to grasp a brief. The designs of Mr. Pullan are in their way like Maynard's treatises. They may not have gained success in the usual sense of the word, and occasionally might be more aptly expressed, but the wise student will find no difficulty in turning them to account.

### WROUGHT IRONWORK.\*

IT is not my intention to-night to deal with the earlier history and production of wrought iron; this has already been done by very able hands, and its study is purely archæological. I wish to take up the subject from about the eleventh or twelfth centuries, and, by means of a number of notes and sketches made at various times when studying in London at the South Kensington Museum and elsewhere, to draw your attention to some of the characteristic features of the various periods which follow. I do not claim for my paper any originality of treatment. My excuse for choosing it is that it has not before been dealt with in our society, and that it is one to which I have given many hours of enjoyable study in sketching rambles in London and the country.

Few specimens of ancient art can be more attractive to the architect or archæologist than those wrought in iron. How greatly is beauty enhanced when utility and simplicity are her companions, and in the few specimens of metal-work which we to-night shall study as examples of the great family to which they belong I hope we may find these three virtues hand in hand. Take, for example, the hinge to the south door of Eaton Bray Church. What can be more beautiful than its graceful curves, its cleverly-wrought ends and enriched surfaces? Its use and purpose are self-evident; not only does it carry the door entrusted to its unerring guidance, but it braces and strengthens all its parts. The material, rude and uninteresting to some though it be, clearly tells by every form and curve the story of the many processes by which it has been wrought; and the very fact that wrought iron carries its history with it seems to me one of its greatest charms.

When we look at the work of the smith long since gone to his rest, we seem to see the man at his forge; and as we look and admire his skill, a fraternal feeling grows in our mind, and we rejoice that, although we pass into the unseen, those of our works which are useful, pure, and beautiful may live after us and be appreciated by those who follow. Can we be surprised that he who wrought the subjects of our study to-night inspired the poet Longfellow with those charming verses which will live as long as England is a nation?

So much for the abstract. Let us get to work. We will look first at the earlier specimens of English wrought iron. These must naturally be taken from our churches—the monumental histories of our nation.

Ironwork has suffered less than many other materials at the hands of enthusiastic religionists, who in the heat of their fanaticism robbed the Church of many of her choicest art treasures. But in the case of iron the metal itself was no great booty, and its office was one of practical service; the spoiler has therefore generally let it rest. Want of proper attention and repair, and the ravages of time have been the principal enemies of our ancient ironwork, and in spite of these, enough remains to show that, in its treatment, difficult as it was to work, the same care and artistic skill were used which characterised the other materials which compose our sacred edifices.

Among the existing examples of wrought ironwork, the hinges on which the doors were hung form the earliest specimens. These owe their origin to Norman architects, and are comparatively rare. At this period they have not generally much scroll work attached to them, and the turns are often very stiff, the principal branches at the head of the hinge representing the letter C. An example of this class of hinge, probably a copy of an old specimen, is the hinge on the doors of our Reading Abbey gateway, restored some years ago by Sir Gilbert Scott. There are also in St. Albans Abbey Church some hinges of this period. The example in fig. 1 has the strap continued right through, and has an ornamental termination, a portion of which only now remains. In the second example, fig. 2, the strap terminates with the commencement of the scroll. The knob at the welding point is fashioned into the head of a serpent; this device, with jaws extended, also occurs at the ends of some of the scrolls, and is in high relief, and is exceedingly well executed. In both these examples the surface is enriched with a kind of chevron, easily produced with the chisel; the thickness of the metal is three-eighths of an inch at the commencement, and is gradually brought down to one-eighth at the terminations.

Another very perfect specimen of Norman work is at Sempring-

ham Church in Lincolnshire. Here, in addition to the hinges, the door has an ornamental iron edging, or border of characteristic design. This border was continued in the Early English work, but was reduced in bulk, and became much more simple. We get an example of this from St. Mary's, Norwich, where we see it in the form of a simple band, nailed at intervals around the edge of the door.

It is interesting to notice the care with which the smallest details were executed; the nail heads even had a characteristic form, of which I have sketched one or two examples.

Although the Early English work was finer in detail, and possesses a better finish, it has not the originality and freedom which the original Norman work possessed. Another very fine specimen of work of this period is on the south door of Eaton Bray Church before referred to (fig. 3). The ironwork here consists of three principal hinges from which the scroll work springs, the straps are relieved by raised bands and lines produced by the chisel, the nail heads, too, form a natural and pleasant relief. You will notice that a conventional, leaf-like terminal has taken the place of the serpent's head of Norman work. Above, and detached from the three hinges, at the top of the door, is a piece of scroll work which acts as a stiffener and completes the design.

There is an interesting example of this period on the doors of the chapter-house at York; the hinges here are quite distinct, the ornamental work being only used to brace the door together. A feature worthy of note in this example is that the work around the closing-ring or door-handle is bossed out in hemispherical form.

We find another example of this class of work on a door at Chester Cathedral. Here the work is divided into panels of different designs of scroll work; they are all exceedingly graceful and of most finished workmanship.

I have roughly sketched a few details which exhibit the variety of terminations, and also the junctions of the several scrolls. You will notice how ingeniously a leaf is made to lap over and hide the points where the iron is welded together.

The section of the scroll work was sometimes raised to an obtuse angle on the face as at York, or grooved on face as at Chester. In all these examples of work it will be seen that the branches all spring from the outer side of the scroll; these, too, have been somewhat elaborate in character, enriched with leaves or animals' heads, the main bands being stamped with various chisel patterns. Examples of another class were utterly devoid of ornament, or at most had ends terminating in simple curls, with free small branches on each side of the main bands. Our own county affords an example of this at Farringdon Church.

In Decorated work the same style of work continued to be used with little if any variation, except occasionally in the character of the leaves on the scrolls, but as time went on the increased use of wood panelling and tracery superseded this flatter kind of decoration, and rendered scroll work less common than in former times.

In the Perpendicular style hinges are rarely ornamented except on plain doors, when they usually have a fleur-de-lis or some similar decoration at the ends of the strap. For example, on the south door of St. Lawrence. Another local example of thirteenth-century work is at Uffington.

The handles of doors, too, received no small portion of the workman's skill and careful attention. Those of Early English and Decorated date were generally in the form of rings, with a simple spindle going through the centre of a circular escutcheon; but sometimes they assumed other forms, the spindles terminating with a small flower or animal's head at each end to keep it in its place. We have before referred to the escutcheon of the chapter-house at York Minster, which is bossed out, having the straight bars running under it. Another method was to ornament them with minute tracery, or with holes pierced through them in various patterns.

Besides the ring handles, others in the form of a bow were used. These were placed upright on the doors, either fixed or, more often, working in a staple at top and bottom. Not unfrequently the handles were made to drop in the form of a hammer, and were used as knockers, striking on a heavy nail-head fixed under them for the purpose.

The escutcheons were sometimes of considerable size and form, the starting-point of quite an elaborate scroll pattern, which when fastened to the door formed a stiffener, and harmonised well with the elaborate Early English hinges.

The limits of my paper forbid me to dwell longer on ironwork as applied to doors, in which case the work was confined to one plane surface. We will now look at other channels into which the skill of the smith was turned.

In the fourteenth century a new feature was introduced in the handiwork of the smith. Whereas in the past the hammer and the tongs were the principal tools employed, the manipulation of sheet iron required other treatment. When first introduced the effect was pleasing and simple; but the artist-smith, led away by the greater ease of manipulation which the thinner metal afforded, soon rushed into elaborate and extravagant detail and an imitative style, rather than originality of detail adapted to the material employed. The idea of impropriety is conveyed by an examina-

\* A paper read at a meeting of the Berkshire Archæological and Architectural Association by Mr. Chas. Steward Smith, A.R.I.B.A., of Reading, on Thursday, January 24.

tion of an example of sixteenth-century Japanese metal-work at the South Kensington Museum. It represents a sea-eagle in hammered and chiselled iron. The bird is swooping from a rock with extended wings. Nothing can exceed the perfection of workmanship displayed in this example. Feather by feather has been imitated in the iron, and with a perfectly natural effect, and yet it seems unfortunate that so much skill and labour should have been expended in such an inappropriate manner.

Perpendicular metal work is of very considerable merit, harmonising well with the sister materials, wood and stone, and keeping apace with them in point of characteristic design. One of the finest examples is the enclosure to Henry VII.'s tomb at Westminster. The screen to the tomb of Edward IV. at St. George's Chapel, Windsor, is an example worthy of special notice in speaking of work of this period. A monument to the honour of Edward seems to have been in course of erection at Windsor during his lifetime, but was never completed. For this tomb this splendid piece of tabernacle work in iron was doubtless intended to be the screen. The framework is of wrought bar iron, and the small rich Gothic compartments are of plate iron cut with a sharp punch.

The screen has a projecting semi-octagonal turret-like form on each side, divided into bays by buttresses which run up the whole height. The spaces between the buttresses are filled up with traceried openings very like the windows of that period. Each bay is surmounted by an overhanging canopy of very fine and elaborate workmanship. The space between the turret-like forms is divided into six bays, which are treated in a similar manner to those before mentioned.

The thought that strikes one on seeing this beautiful piece of workmanship is that it partakes rather of the character of a model of a stone structure than bearing itself an individuality of treatment with a self-evident purpose for its existence. It has generally been attributed to Quentin Matsys, the famous Antwerp blacksmith and artist, but it appears that a certain John Tresilian was the person who wrought the screen in question. Nevertheless, the name of Quentin Matsys will still live in our memories on account of his admirable picture of *The Misers* in Windsor Castle and the romantic story of his love at Antwerp.

When at Windsor last week I was struck with a very fine and much earlier piece of ironwork on the interior of the east door of the choir of St. George's. This probably belonged to the original building before the present chapel was erected. I should here like to mention the kind courtesy shown me by the very Rev. the Dean of Windsor in giving me access to the many objects of interest at St. George's, and also in suggesting authorities on their history.

The existing examples of Elizabethan ironwork are scarce, but a few lock plates, hinges, &c., that I have noticed have been marked by a characteristic treatment. I have made a sketch of an interesting specimen of local Jacobean work at Hurst Church (fig. 4). It is a bracket for an hour glass bearing the date 1636. It is now painted and gilded; the initial letters probably refer to the donor, but its origin is unknown.

I have a sketch, too, of a very humble but nevertheless interesting bit of work from our own county (fig. 6). It is the latch of a cottage door at Stanford-in-the-Vale; it is cut from a piece of plate iron, with a bow handle of circular section. A further example of domestic work in this century is a knocker from East Grinstead, Sackville College, bearing the date 1616; it is of the simple drop arrangement, like those of a much earlier date, but is divided towards the top into two arms which work in a pair of staples. I have made some sketches of an example of Jacobean work at the South Kensington Museum, which illustrates very forcibly the powers of the English smith. It is a screen formerly separating the pew of the Leveredge family from the Lady Chapel in the church of St. John, Frome. This specimen is singularly happy in design, and delicate in execution. The composition gives due importance to the central feature bearing the armorial shield, while the side panels are agreeably diversified. The general size of main bars is  $\frac{1}{2}$  inch by  $\frac{1}{2}$  inch. The lines of hammered work are not obliterated by sheet work, although there is quite sufficient of the latter to give a richness of design.

I shall now pass on to notice those examples of wrought ironwork so well known to all who have visited South Kensington Museum, namely, the screens from Hampton Court. They are twelve in number, and were formerly placed at intervals of 50 yards in the fence dividing the Palace Home Park from the garden, but falling into decay they have found a suitable refuge in the museum.

We are told that we are indebted to a blacksmith of Nottingham, named Shaw, for these matchless works of art. Shaw received his commission from King William III., but as the king died before the completion of the work, or at least before the screens were paid for, the Parliament of the time repudiated the debt, and Shaw, it is said, died from disappointment at the age of fifty-one. He was buried at Hampton Church, and we find a tablet outside the church recording the fact, and very charitably describing him as "an artist in his own way," which probably meant that he was neither a painter nor sculptor. His claim to be an artist was doubtful, even in the face of the magnificent work

which his brain had conceived and his artistic hammer and chisel had enabled him to carry out. Is there not a tendency in these days to disregard art because of the source whence it springs, and to assume that artistic genius can only run in channels cut out by officially constituted institutions?

The screens are 13 feet wide by 11 feet high, and altogether exhibit a wonderful amount of labour and ingenuity. The general construction of the whole series is of one pattern, but four of them are of richer detail than the others. The supporting standards on each side are two panels 2 feet wide, formed of uprights 2 inches square, filled in with a pattern of inch bars, and supported by stays. Between these is a foliated composition of elliptic scroll work with bold foliage and flowers, surrounding a panel about 3 feet square, which in the four principal screens enclose representations of the national emblems—a rose, a thistle, and a harp—the remainder being filled in with a diaper pattern. Above this is a heavy swag or chain of flowers, hanging from the beaks of eagle-headed scroll terminations, and crowning the whole is a foliated mask with a figured and tasselled apron. All the detail is wonderfully wrought out, the small rosebuds and sprays being represented with great fidelity to nature. It is curious that although the workmanship in an artistic point of view is so good, the construction of the ornament is proportionately bad. Very few of the scrolls or stems are welded at the junctions, but are simply united by iron tongues and pins, the heavy strains on which in some instances have caused them to give way.

The leafage, too, which in the most ordinary gateway of the period was always welded to the stems from which it springs, is here merely rivetted or screwed to the larger branches in several pieces.

Most of us remember the magnificent screens at St. Paul's Cathedral. They are the work of a Frenchman named Tijon, a Protestant refugee. In these we see distinctly the master designer's hand, but more freedom was left to the workman in those days than now, and we notice a refinement which characterises these screens when compared with the Hampton Court gates. We here have an opportunity of judging of the relative merits of French and English workmanship. I have an illustration of these gates which gives a good idea of their design.

As a comparison with the English work which we have been studying, it will be interesting here to look at one or two sketches of German work. We have just been noticing applied ornament such as foliage, wrought in thin iron, and attached by pins and rivets to the scroll work, as at Hampton Court and elsewhere. But a peculiar feature in German work is the structural ornament in the form of figures worked in the solid as continuations of the scroll bars. Nevertheless these often in addition had leaves and foliations of sheet iron attached. The foliage here grows naturally out of the main lines, to which it is kept in subordination. The terminations of the voluted scroll are points in the design which fitly receive ornamentation, and this detail alone deserves attentive study. In examining these examples of smiths' work, we are struck with the mastery displayed in manipulating the material—whether cold or hot—with the methods by which combinations of forged work, hammered work, or *repoussé* work were effected, and the complete adaptation of the means to the end in view.

The realisation of the design already worked out in the mind of the artist-smith is evident in all the best and most representative works. The material and modes of manipulation persistently demanded that the smith should know exactly where he was going before he set out, and every curve had to be carefully laid down full size on the blackened and charred board, the surface of which displayed the chalk lines he was to follow by the aid of his anvil and vice.

A very fine example of this is the German window grating in the South Kensington Museum, of which I have a sketch (fig. 7). In the centre we have a fret or lattice-formed figure, resulting in a quatrefoil of interlaced scrolls; out of these scrolls spring spiral curves, bearing foliage of a highly decorative character, and yet the details are all simple and in perfect unity with the purpose of the work as a round-headed window grating, while the scope afforded for the workman has been fully taken advantage of.

The scheme of the design is of the simplest kind. The details supplement the arrangement of the curves, and naturally fall into the spaces not occupied by the leading lines. The lunette form seems to naturally suggest the filling in; and on analysis one can see that the growth of the whole is symmetrical, and comes almost as a matter of course from the fret-like figure which is the centre feature of the work. The larger and secondary scrolls have terminals of forged and twisted iron, welded into the main lines, the tendrils being used at certain points to bind the whole together in a very ingenious manner. The broader details are of *repoussé* and shell work, consisting of rosettes of different sizes and broad leaves of an ornamental grotesque type in imitation of a mask or human face. These are rivetted to the points of the scrolls to which they form the terminals.

We come now to what I think by no means the least interesting part of our subject—the ironwork of the Early Georgian period. Interesting to us because it tells us of those days when work was well and carefully done—those days when, if sanitary science were treated with contempt, there was a thoroughness and strength in

building which is too often wanting now. This period of ironwork is interesting because we frequently meet with specimens in our everyday walks. In our town there remain a few examples, for instance, which are not unworthy of notice—a neat little bit of scroll work in the form of a spandril outside the Conservative Club, and there is an uncommonly good specimen or two as railings round the tombs in St. Giles's Church (fig. 8). It is a matter for great regret that a fine bit of old work like this should be allowed to decay for the want of a little attention and trouble.

I have here two or three sketches of work in and around London (fig. 9), that in Great Ormond Street, Bloomsbury, being specially worthy of careful study (fig. 10). To my mind there is a great charm about these old brick mansions. If they were unpretentious in appearance, they were at least as strong as well-burnt brick and honest workmanship could make them. Their timber was sound and well seasoned, and their foundations ample, while their internal fittings were spirited in detail and laudable in execution; and the wrought iron introduced to decorate their façades in the shape of gates and area railings was designed in harmony with the nature of the material employed. This idea of producing an ornament consistent with the material is a special feature of work of this period; for, much as we admire the sheet-metal foliage in the gates at Hampton Court, we can but regret that its construction is so bad and durability so questionable.

It has well been said that the great principle in designing wrought iron is to produce a design composed of bars or lines connected together in such a manner as to combine lightness and strength, and this idea was realised in the period which we are examining. The bars were manipulated in various ways: of sections round, square, or moulded; and the combinations of straight and curved lines offer an endless variety of pattern.

I should like to call your attention to the terminations of the voluted scrolls as points in this class of work especially deserving notice. A great variety of these were evolved out of the two principles of spreading the end, in one case in the depth of the bar, in the other in its width. The spandril piece from the railings at Bloomsbury is a fine example of these treatments. These methods, in their simplest form, with a parallel treatment and a variation of round and flat iron are generally found used together in our English work of the period, giving a diversity to otherwise similar forms. It is difficult to conceive a more appropriate form of fence than the area railings of the last century, which are familiar to us all, with their standard panels at intervals in the assemblage of square bars.

The bold form of spear head and occasional ramp with the now obsolete lamp bracket and torch extinguishers quite sufficiently relieve the design from tameness, for there is often more character in a simple forging than in many pretentious patterns drawn from the sand mould, as a comparison between the spear heads I have mentioned and the usual run of cast railing will testify.

Very many happy little bits of wrought ironwork are to be seen on the signboard standards of our village inns, and in one or two instances I have seen the wrought-iron brackets which bear the pawnbroker's sign possessing (to use a pet phrase in a recent trial) considerable artistic merit. A fair idea of work of this period can be obtained from some of the capital illustrations by Mr. R. Caldecott in his children's books, and a plate issued with the *Graphic* some few years since called *Out of Reach* has a fine example of wrought iron.

I must now bring my paper to a conclusion, with an apology for its somewhat discursive character, but, as I told you at the beginning of the evening, it is rather a collection of notes than the expounding of any original principle or theory.

I have tried to give you just enough of each period to assist you in recognising it when you casually meet it again, to assign to it an approximate date, and if we learn any lessons of care in details, propriety of material, and prominent purpose of design from the departed workmen in this branch of art manufacture, we shall be amply repaid for the time spent in its study.

## REVIEWS.

LES ARTS DU BOIS, DES TISSUS ET DU PAPIER. Paris: A. Quantin.

It is generally supposed that there is less opportunity for co-operation in France than in England, and that everything has to be done in that country by the State. But the existence of the Union Centrale des Arts Décoratifs might be cited to demonstrate how little truth there is in such a supposition. Although there are many societies of artists in England, there is not one that exactly corresponds with it. The nearest approach to the Union Centrale is, perhaps, the Arts Club in Liverpool and the Burlington Club in London. The members of the Union, in addition to many other descriptions of honorary work, have organised annual exhibitions of decorative art, which in some respects resemble the periodical display of loan collections at South Kensington, and in others correspond with the ordinary exhibitions of pictures and statues. We can testify that these exhibitions entail an enormous amount

of labour on the organising committee, and, so far as we have been able to judge, the success, if judged by the number of visitors, is not commensurate with the preliminary toil.

The contents of the exhibitions are unknown outside France; but, as the opportunity has been utilised of preparing monographs on the different departments, students all over the world will be enabled to profit by the labours of the Union Centrale. In the volume which has been issued by M. Quantin the subjects treated are industrial art as applied to wood, textile fabrics, and paper. At first sight it may not be evident how much is included under so simple a title. Wood comprises figure sculpture, both in the round and in relief, and decorative furniture, whether of wood alone or of wood in combination with other materials. The examples selected are from the principal collections in France, and represent the works of the greatest artists. There is no hard-and-fast line drawn, and thus we have also works mainly in bronze or the precious metals, and in marble. Under the head of Tissues we find tapestry and other descriptions of weaver's work, embroidery of all kinds, lace, printed and painted fabrics. Paper includes illumination, early printing and wood-cutting, engraving, and bookbinding, wall-papers, &c. There are special essays on modern furniture and on Japanese art. When it is said that the work is embellished by more than three hundred reproductions of beautiful drawings by M. Libonis and other artists, and that the authors of the different monographs—MM. De Champeaux, Darcel, Gaston le Breton, Gasnault, Germain Bapst, Duplessis, Broux de Mailion, and Victor Champier—are all recognised as authorities, the value of the volume will be evident. It is an admirable example of the class of books which the French artist has at his service, and by which he is enabled to contend with so many rivals in other countries.

DILAPIDATIONS. By BANISTER FLETCHER, F.R.I.B.A. Third Edition. B. T. Batsford.

On the subject of dilapidations there are not many architects who have a better claim to be regarded as an authority than Mr. Banister Fletcher. The worth of his book is shown when it is found to have reached a third edition—an amount of success which few professional works have the good fortune to attain. The legal portion of the new edition has been revised by Mr. E. A. Bullen, barrister. The use of the book is not restricted to tenants, and a perusal of the pages would often enable a tenant to understand his risks, especially under repairing leases.

THE DECORATOR'S ASSISTANT. A. J. Barnes & Co.

In this little book there are upwards, it is said, of six hundred recipes; some of them are rather obsolete, but a large number will have their use for people who prefer to make their own varnishes, dyes and other preparations, and for amateurs who wish to have the whole of a process explained in a few lines. Taken as a whole, it is a remarkable collection, and a reference to the recipes may often save the labour of hunting for information in special treatises.

PAINTING AND PAINTING MATERIALS. By CHARLES CONDIT and JACOB SCHELLER. E. & F. N. Spon.

It would seem that the primary object of this sterling book is to give information respecting the painting of railway carriages, which in America are completed in an elaborate style. To attain this end, which might be considered to be the summit of craftsmanship, the theory and practice of painters' work are explained, so that the volume will be serviceable in all branches of the trade. Great care has been taken in the compilation, and the investigations of a larger variety of authors, and of a better class, have been utilised than we usually find in books of this kind. It was at one time said that the best compilations were those of Frenchmen; but on practical subjects the Americans are taking the lead, and "Painting and Painting Materials" is a good type of what is being done. The quality of the book is not to be judged from the frontispiece and ornamental letters, which are not in keeping with the contents.

## SCHOOL BUILDINGS.

**New Basford.**—Baptist Sunday schools, situated in Chelsea Street and Duke Street, have been opened. The style of architecture is decorated Gothic, and the building comprises nine classrooms and an infants' room on the ground floor, with a large assembly room above, capable of accommodating 450 scholars. The platform at one end of the room will provide accommodation for a choir of forty voices. Mr. Lawrence Bright, architect, St. Peter's Church Walk, Nottingham, prepared the plans, and the contractors were Messrs. Dudson & Parrish, New Basford. The building has been erected at a cost of 1,800*l*.

**Southampton.**—Sunday schools erected at the rear of Portland Baptist chapel have been lately opened. The building is solidly constructed, the exterior being faced with white bricks, relieved with Bath stone dressings and string courses. The building is three storeys in height, and contains on the basement floor lecture-room, 35 feet by 20 feet, communicating with the previously existing schoolroom by large folding doors, which can be thrown into

one as occasion may require. This floor has also been fitted with separate lavatories and offices for boys and girls, kitchen, &c. The principal floor is of the same level as that of the chapel. It comprises committee or Dorcas room, two class-rooms, minister's vestry, gentlemen's and minister's lavatories, &c. The first floor contains five class-rooms of varying sizes, new organ-chamber, ladies' lavatories, and book stores; while new approaches are provided to the north and south galleries of the chapel. The staircases have been constructed wholly of pitch-pine, and a small class-room has been formed in the tower over the same. Special attention has been directed to the ventilation, each class-room being provided with an inlet for fresh and outlet for foul air. Mr. W. H. Mitchell, of Portland Street, Southampton, was the architect, under whose personal superintendence the work has been carried out in an efficient manner by Mr. H. I. Sanders, builder, of Northam. The gasfittings were executed by Messrs. Lankester & Son.

**Midgley.**—New Connection Sunday schools have lately been opened. The buildings have been erected from the plans of Mr. Thomas Horsfall, of Manchester. The contractors were, mason work, Mr. Thomas Pickles, Midgley; joiners' work, Mr. Edwin Marsland, of Booth; slater and plasterer, Messrs. J. & T. Alderson, Luddenden; plumber and glazier, Messrs. Jonas Alderson & Sons, Luddenden Foot; painting, &c., Mr. Heap Uttley, of Hebden Briage; warming apparatus, Mr. J. H. Boulton, of Halifax. The total cost has been about 1,400*l*.

### NEW BUILDINGS.

**Liberal Club, Newcastle-on-Tyne.**—The old posting-house, the Queen's Head in Pilgrim Street, has been transformed into the Junior Liberal Club. The old staircase, which is the finest in the town, and as far as practicable the other features, have been retained. The club has thus a familiar appearance for the members and a comfortable air that is attractive. The alterations and improvements have been made from the plans of Mr. Knowles, of the firm of Newcombe & Knowles, Newcastle. The contractor for general work has been Mr. J. Smart; for plumbing-work, Mr. R. Herron; and for decorator's work, Mr. John Gibson; and Messrs. Henry Chapman & Son, Northumberland Street, have supplied the furniture. The whole of the work has been carried out under the immediate superintendence of the architect, Mr. W. H. Knowles.

### SANITARY WORKS.

**Fulham Infirmary.**—The housing of the poor is a question of very general and earnest discussion. How far practical results will follow time will reveal. The sick poor, however, are evidently well cared for in a commendable way. As an instance of this, we refer to the new infirmary which has been recently erected in Palace Road, Fulham. Admirably designed as the building is by the architects, Messrs. Giles & Gough, they have found excellent coadjutors in the guardians of Fulham Union as regards the important matter of warming and ventilation. To a committee of their body was entrusted the duty of selecting the best stove for the purpose. A few of the leading manufacturers were therefore invited by them to submit their stoves in competition, and, after a very careful trial, the "War Office Ventilating Air Stove," manufactured by Messrs. Yates, Haywood & Co., of Rotherham, and No. 95 Upper Thames Street, London, was deemed the fittest and most efficient. It has consequently been chosen for all the sick wards of the infirmary, which number about thirty. This stove, we understand, has already been extensively used for entrance halls and mansions, as well as for hospitals, barracks, hotels, and railway stations. No question is being considered of more vital importance than that of good and efficient warming and ventilation.

### GENERAL.

**Mr. Armstead, R.A.,** has been commissioned to execute the memorial statue of the late Bishop of Llandaff.

**The Sale of Pictures** at the recently-closed exhibition of the Birmingham Royal Society has amounted to nearly 5,000*l*.

**The Dunfermline Fine Art Exhibition** closed last week, after being open six weeks. A sum of 1,350*l*. was received during that time from the sale of pictures.

**A Paper on Celtic Art** was read by Mr. R. Thornton Shiells at the meeting of the Edinburgh Architectural Association on Wednesday.

**Messrs. Clark & Moscrop,** of Darlington, have been appointed architects for the new vicarage at Hipswell, near Catterick. Four local architects were invited to compete by the Trustees.

**Welham Hall,** in East Yorkshire, a fine old mansion, the residence of Mr. Robert H. Bower, J.P., has been destroyed by fire. A valuable collection of pictures and the family plate were all that was saved. The origin of the fire is attributed to the overheating of a flue.

**A Landscape** by Mr. Carl Heffner has been purchased by the trustees of the Sydney National Gallery.

**A Committee** for the organisation of the great Universal Exhibition at Antwerp in 1885 has been definitively constituted, under the presidency of M. Victor Lynen, one of the principal merchants of Antwerp. Work will be commenced in April next.

**An Episcopalian Church** is to be erected at Thurso from the designs of Mr. A. Ross, of Inverness. Among the contributors to the building fund are Mr. Gladstone, the Bishop of St. Albans, the Duke of Buccleuch, the Earl of Glasgow, the Earl of Home, Earl Wharnccliffe, Lord Forbes, and Sir Tollemache Sinclair, M.P.

**Birmingham Architectural Association.**—The third ordinary meeting of this association was held at the Queen's College on Tuesday evening, Jan. 15, under the presidency of Mr. W. H. Kendrick. The following new members have been elected:—Messrs. D. Arkell, J. Cotton, W. Read, B. McEvoy, A. H. Knott, and H. Beck; and two other gentlemen have been nominated for membership. A paper was read by Mr. Victor Scruton on "Life, death, and futurity in Architecture," followed by a discussion and a hearty vote of thanks, in which the following members joined:—Messrs. J. Cotton, H. H. McConall, F. G. Hughes, T. W. F. Newton, and the hon. secretary, Franklin Cross.

**Mr. Thomas Bolas** will deliver, on Monday next at the Society of Arts, the first of a course of Cantor lectures on "Recent Improvements in Photo-Mechanical Printing Processes," in which he will deal with new developments of the Woodbury Type process. The second lecture, on February 4, will be on type blocks from line-drawings and half-tone subjects; and the third and concluding one on February 11 will be devoted to the consideration of intaglio plates, collotypes, photo-mechanical methods as applied in the decoration of pottery and miscellaneous processes.

**Mr. H. H. Gibbs** has undertaken the restoration of the high altar screen at St. Albans Abbey, including the insertion of sixty-five statues, and the replacing of the crocketed pinnacles. The work will be carried out under the direction of Mr. Chapple. Sir Edmond Beckett intends to remove the roof of the north aisle, and to reinstate it at its original height. The roof of the south transept will subsequently be dealt with.

**The Gravesend School Board** have adopted plans by Mr. Gosling for proposed schools in Milton Road.

**The Report of the Royal Commission** on Technical Instruction will, it is stated, be issued early in February.

**The Rochester Churches Fund,** for the building of ten churches, has reached 42,350*l*. 16*s*. 10*d*., making it necessary to raise a further sum of 8,000*l*. in order to build the remaining two churches on the list. A public meeting will be held at Willis's Rooms on February 26, when steps will be taken to raise the balance required to complete the fund.

**Mr. C. Purdon Clarke** has arranged for the representation of an Indian village and tea garden at the forthcoming International Health Exhibition. Natives are to be brought over from Bombay and Darjeeling to complete the scene.

**Mr. J. Earnshaw,** Bridlington Quay, has been appointed architect for new Board school at Thwing, East Yorkshire.

**The Commissioners of Sewers** have adopted a resolution that it is necessary to abolish the house-tax, to give greater facilities for the erection of artisans' dwellings.

**The Annual Distribution** of prizes to the Battalion of the 20th Middlesex R.V., "Artists," will take place to-day (Saturday), at the Criterion, when the chair will be taken at 6 P.M. by Lieut.-Col. Edis, F.S.A., commanding. The prizes will be presented by the honorary colonel of the regiment, Sir F. Leighton, P.R.A. The annual regimental dinner, to which the Adjutant-General, General Lord Wolseley, K.C.B., &c., Lieut.-Gen. Higginson, C.B., commanding the Home District, Major-General Elkington, C.B., and others have accepted invitations, will take place immediately after the distribution of prizes.

**Messrs. Strode & Co.** have supplied all the fittings and other appliances for the lighting, both by gas and the electric light, of the new Prince's Theatre, in Coventry Street, and there has been general approval of their arrangements.

**Lowe's Wood Block Flooring** has been adopted after special investigation of its qualities by the Midland Railway Company for the extensions to their hotel at Derby. It will be laid on a bed of concrete.

**The Surveyors' Institution.**—Upwards of 100 candidates have entered their names for this year's examinations—54 for the preliminary examination to be held during the present week, and 50 for the professional examinations in April. The latter number comprises 40 candidates in the land agency, valuing, and building-surveying sections of the Associates' Examination, and ten in these sections of the Fellowship Examination. Many of the candidates are past or present students at the Agricultural Colleges, the City of London College, and other places of technical and scientific education. The institution now numbers upwards of 1,000 members, of whom nearly 500 have been elected since the incorporation of the institution by Royal Charter two years ago. Of this number 580 hold the fellow's diploma, and 263 the diploma of professional associate.

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, JANUARY 26, 1884.

### TENDERS, ETC

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### ADVERTISEMENT SCALE.

# The Architect.

## ON THE SCIENCE OF BUILDING RISKS.

As a thoroughly practical and useful association of men of business, the Surveyors' Institution seems to be always notably recognisable; and the more so when contrasted with another similar society in which architects are interested, and which just at present is not fairly chargeable, perhaps, with a desire to be more than modestly ornamental. It is at the Surveyors' Institution, therefore, and not at the Institute of Architects, that we find Mr. T. M. RICKMAN, a member of

both Societies, reading a thoughtful paper upon the important question of the "risks" incidental to building contracts; and it is to an audience mainly composed of property agents and valuers that he makes an appeal on behalf of the common sense of the matter.

Mr. RICKMAN's mode of dealing with his subject is based upon a sound principle which we do not remember having come across before in the same form. The "risks" in question—that is to say, the more direct uncertainties or hazards connected with the building of a house as a commercial transaction—may in an ordinary way be regarded under two heads, namely, risks to builders, and risks to employers; but Mr. RICKMAN points at once to the self-evident fact that, when looked at more scientifically, both of these are hazards primarily belonging to the employer or proprietor alone, and that all "risks" which a contractor takes are so many of such hazards taken, whether for a proper consideration or not, from off the owner's shoulders. "Though these several risks," says Mr. RICKMAN, after setting them forth in order, "may be divided into two classes, they are originally all those of the employer; he engages an architect to minimise them for him" (a more commercial than æsthetic statement of the case); "some of them he can get rid of, others remain;" and then the object of the argument is to provoke attention to the claims of general fair play aided by specific accountanship, with a view to the relief of unwary contractors from speculative liabilities.

The builder's risks are set forth somewhat as follows:—The variations and uncertainties in the prime cost of materials and labour; the uncertainties of the foundation; the hazards as regards adjoining buildings; the chances of accident to person and property; the possible difficulties of obtaining payment; the penalties for delay; the chances of error in the estimates; and the doubtful operation of official control, amongst which our lecturer includes one very delicate source of "risk," delicately expressed, namely, "the idiosyncrasies of architects."

The "risks" which are still left to be borne by the owner are those which refer to extra cost; to delay by weather and by strikes; to the possible failure of the contractor; to structural defects; and to those shortcomings of the architect, which Mr. RICKMAN tenderly suggests are only to be apprehended in cases where that functionary is imperfectly acquainted with local peculiarities.

From this statement, made as it is by a quantity surveyor of well-known character and eminence, it may be gathered that it is not unusual for the architect and his quantity surveyor to saddle the contractor with a serious "risk" as regards the cost of making a sound foundation for the building. We may be excused, we hope, for doubting whether this can really be the fact; that is to say, whether any builder in his senses would submit to such a burden, or any respectable architect or surveyor attempt to impose it. Of another of the "risks" we may say the same, namely, that which pertains to the unavoidable damage of adjoining premises. Not only do we venture to assert that any architect who would propose by the artifice of "general clauses" to throw upon a contractor, selected by a competition of tenders, the responsibility for an indefinite amount of extra expense in foundations, or in the support and restoration of adjoining buildings, ought to be treated by the contractor to a bit of his mind; but we take leave to doubt whether any court of law in the kingdom would be found persuadable by even the most ingenious advocacy to act upon

a contract so palpably at variance with the first principles of all honest bargaining. We consider, therefore, that in the adjourned discussion of Mr. RICKMAN's paper, which is appointed for an early day, the author, if only as the representative of respectability in his own profession, would do well to declare explicitly that these two risks at any rate are disavowed by men of good faith.

The "risk" attaching to the possible insufficiency of the quantities called forth some very indignant animadversions upon the conduct of the Office of Public Works in respect of certain current advertisements for tenders, to be delivered upon bills of quantities officially supplied, but for the accuracy of which all responsibility is expressly repudiated. We must confess that we cannot quite sympathise with this particular complaint, which seems rather to distract the attention of true reformers. The case is peculiar and exceptional, almost *sui generis*, and logically dangerous. The employer is the Government, which is certainly entitled, before all other employers, to insist upon the technical impossibility of admitting elasticity into any of its contracts. It is to be presumed also that the bills are prepared by the very ablest experts, and of course without any sort of pressure. In the particular circumstances, therefore, the surveyors are surely not to be expected to interpose a personal guarantee between the high contracting parties; and who else is to do it? Even in ordinary building transactions, such a guarantee is well known to be practically almost impossible; and hence the agitation which has been going on for many years back in favour of constituting the bill of quantities the formal basis of the contract. This agitation, moreover, on its own ground, we cannot help frankly approving. Indeed, we consider that Mr. RICKMAN, unconsciously perhaps, but none the less forcibly, has shown that the practice of imposing "risks" of whatever nature upon a building contractor ought always to be confined within the narrowest possible limits.

In a word, the "risks" of building, as all experts will acknowledge, are quite sufficiently intelligible to admit of their being fairly discounted by a building proprietor (a totally inelastic "department" perhaps excepted), but they are not sufficiently ascertainable to admit of their being discounted by an ordinary building contractor; and hereby hangs a very important argument which we need not follow out, but the conclusion of which is the same that we have already stated, that the precise limits of the contract ought in all cases to be distinctly understood by means of all speculative "risks" being expressly excluded. Why should a builder—especially a lowest-tender contractor—take off my shoulders the incidental "risks" of my speculation? The very essence of my speculation is that I take all the expected profits; and I must surely set off against these the possibilities of unexpected loss. A gentleman spoke, in the debate on the paper before us, of "insurance" as the proper designation for the contractor's supposed appreciation of "risks;" and the phrase was caught at by some of his hearers as defining a principle apparently which is in some way equitable. But it was promptly pointed out by a following speaker that insurance can only be an act of combination, to equalise chance risks on the basis of mathematical average, which is quite a different thing from the act of thrusting upon an unwary contractor the responsibility for accidents beyond the reach of his foresight, and especially when his contract has been brought about by keen competition in price. There are instances in which, this process not being resorted to, the principles of contract are so far different. The contractor is allowed to discuss all "risks," and to appreciate them fairly; but what follows? The employer almost invariably objects to speculative items being included at speculative prices. "If he throws on the builder," says Mr. RICKMAN, "unreasonable risks (sporting items in the bill of quantities), he must pay heavily for getting rid of them." Instead of this, therefore, may we say that in too many cases he "engages an architect to minimise" such risks by putting general clauses into his specification, which a competitor by tender dare not appreciate fully, and must rely upon Providence to get him out of by hook or by crook?

What does worthy Mr. RICKMAN mean by "the idiosyncrasies of architects" as a source of risk? The long word which he here uses is manifestly a euphuism, a dainty phrase to indicate a little more than appears on the face of it; and the only thing we can suggest by way of explanation is the undeniable fact (we are sorry to say) that there are certain archi-

roots whose accepted duty seems chiefly to be to get their work sanctioned for at an inadequate price, and then to enforce its performance in a superior manner—the low price for their employers' sake and the better quality for their own. It is far from our wish to throw discredit upon the whole profession for the fault of a few of its members, and we are prepared to say that there are very many architects on the other hand who recognise both in principle and practice the great natural law of contracts, that unless the bargain be a fair one at the beginning it cannot be a satisfactory one at the end. Not only so, but we are inclined to lay quite as much blame upon quantity surveyors as upon architects for the introduction of "rinks" into contracts. It is generally said that a builder can take care of himself so exceedingly well that he needs no nursing, and so on; but a competition of tenders goes a long way beyond this. Let it be remembered that, as Mr. RICKMAN points out, *all risks* are primarily *builder's risks*, and this will put a very different complexion upon many of the liabilities which are too commonly expected to be accepted by a builder in a spirit of moral courage that can only lead to the substitution of loss for profit and bankruptcy for well-doing, to say nothing of a perpetual worry about extras, accumulated in self-defence *per jactant negotia*, instead of the honourable performance of an honest contract.

### BUCKFAST ABBEY.

By J. TOM BURGESS, F.S.A.

WANDERERS on the upper regions of the picturesque river Dart, far above the fortified heights of Totness, where BAYTUS and his Trojans are said to have landed in the fabulous ages, have come across, when on the eastern verge of Dartmoor, a few remains of an ancient religious house, which has been known under a variety of designations, as Bulliestra, Bughesta, Bussessewa, and Buckfast, by which name it is still known. It is in the hundred of Stanborough and the parish of Buckfastleigh, and is noted as being the site of one of the earliest monastic institutions in Devonshire, its "early history being lost in remote antiquity." It was doubtless owing to this that the council of the Society of Antiquaries at their last meeting made a grant in aid of the excavation begun on the site, with a view to ascertain the plan of the buildings, and to see if any remains of the more ancient monastery existed. What has been done hitherto was explained to the Fellows at the ordinary meeting of the Society on January 24, by Mr. F. WALTERS, architect, of 2 Queen Street, Westminster, with the aid of a series of plans, views, and photographs. Mr. WALTERS seemed to be unaware of the existence of a concise account of this ancient establishment, by Mr. J. B. ROWE, F.S.A., in his "*Cistercian Houses of Devon*," which was privately printed in 1879, and therefore his address lacked that human interest which should always attach to papers of antiquarian research. There seems to be no doubt that Buckfast was the seat of a fraternity of monks or religious ascetics long before the Conquest. The monks indeed pleaded in the reign of EDWARD I. that they held a certain manor called *Sol. Monasterium* by the gift of King CANUT, who appears to have been much interested in this portion of Wessex. At the time of the Domesday survey, Abbot AUCOKE and his monks were not only settled at Buckfast, which was the head of the abbey, but had considerable possessions in land and other property throughout the county. Whether the monastery was dissolved and its lands confiscated after the Conquest is a matter of dispute, for LELAND asserts that ETHELWARD, the son of WILLIAM POMEROY, was the first founder, and FOLT and FULTON assert that the Duke ALBERT erected a first abbey here for the Cistercians *before the Conquest*, which, as there were no Cistercians anywhere for more than thirty years after the Conquest, cannot be true. Indeed HENRY I. confirmed to the monks all their lands and tenements as they held them from "*ant. vet.*" and as HENRY died two years before the alleged grant from ETHELWARD, the latter, though he might have been a benefactor, cannot be called the founder. It seems clear that there was no dissolution of the abbey when it surrendered itself into the hands of St. EDWARD, with the mother house of Savigny. No foundation deed has been discovered, and we have no documentary evidence to show when it was re-edified. It was surrendered by GARNELL DOWNE, the abbot on

February 25, 1538. For this he was rewarded with the large pension of 120*l.* per annum, which he enjoyed with other emoluments for more than twenty years. The abbey church and buildings were shortly afterwards granted to Sir THOMAS DUNNIS, an ambitious knight, who seems to have pretended to be the friend of the monks whilst doing his utmost to profit by their disasters and misfortunes. There had been prior to this a charge of appropriating six tadders of lead from the priory, which he denies in a letter still extant in the Land Revenue Records. Amongst the subsequent possessors was the name of Sir RICHARD BAKER, the well-known author of the "*Chronicles*," beloved by Sir ROGER DE COVERLEY. In 1731 a view of the ruins was published by BUCK, which was exhibited at the Antiquaries, which shows a confused mass of gables and walls, without affording the slightest clue to the plan. In 1796 a Mr. LASKEY published in the *Gentleman's Magazine* an account of the ruins, which, though unsatisfactory from an architectural and archaeological point of view, is useful as a key to the ground plan which is now about to be unfolded. Mr. WALTERS read a portion of this in illustration of the plans.

Mr. LASKEY pointed out that there remained of this ruin, which he called "magnificent," two arches which appear to have been the entrance, and some ruins on a large scale which he took to be the lodge. The arches are situated one behind the other, and stand across the road leading from Buckfastleigh to Ashburton; the iron staples for gates to hang upon still remain, and are of great bigness, which led us to think they were of massy structure. The ruins of what we took to be the lodge stand on the eastern side, its length about twenty paces, breadth eight paces (not being supplied for a minute measurement we were obliged to content ourselves without thus roughly, taking care to diminish rather than exaggerate). On the same side are several apartments, one of which is inhabited, and another is converted into a pound-house, in which stands a moorstone trough of great bulk for the purpose of breaking apples for the pound. The following measurement I received from a learned gentleman who has paid great attention to these ruins. The diameter of this stone is 9 feet 4 inches, depth 3 feet 8 inches, one half of which is sunk in the ground. The supposed weight before it was hollowed he computes must amount to above 100 tons. It is of the granite kind, and affords matter of surprise by what means it was brought there, stones of that quality not being to be found within the distance of many miles, round the abbey being one continued lime rock, which is worked in many places a depth, height and extent surprising, and forming a vast cavern at once terrific and beautiful, which proves an inexhaustible fund of gain to the owner.

The remainder of these ruins are situated in an orchard on the western side of the road, at the bottom of which runs the river Dart, seemingly regretting the downfall of the abbey. The first thing that presents itself, tradition says was the abbot's cellar, which is entered by a small Gothic gateway, and is about twenty-eight paces long and twelve wide, arched overhead. At one end remain a few steps which lead to the ruin above, which our guide told us was the abbot's kitchen; it is now converted into a kitchen-garden. At the south end is the skeleton of a set of apartments, which appear to have been the cells of the monks, which was approached by winding steps, fifty one of which now remain. It is of particular form, having, as well as we could guess, seven sides. The immense bunches of ivy, dropping in rich festoons, almost buried its form. On removing some of these we could plainly observe the holes in which the joists and sleepers rested for support of the flooring from which we judged the rooms to be about six feet clear one above the other. These we were told solely belonged to the abbot. Joining this was their court of judicature and judgment-seat, and, behind, a dungeon for those that, by their offences, were thought worthy of the same. On the north-east side appear the walls and foundations of this once spacious and splendid seat of superstition; the abbey church and the remains of its tower all lying in such massy fragments that it is scarcely to be conceived by what power so vast a fabric could be disjoined. The walls appear to be of the thickness of nine or ten feet, and entirely composed of small stones in layers, and a compost of lime and sand, which we supposed to have been thrown on these layers hot, after the method anciently used in such large buildings, which incorporating together formed a mass as solid as the native rock. The ruins of the church appear to be about 150 feet in length, and

the ruins of the tower towards the south seem like huge vast rocks, piled on one another in extensive confusion—

By Time's fell hand defaced,  
The rich proud cost of outworn bury'd age.

Mr. LASKEY evidently thought that as stone for building was plentiful in the neighbourhood, the ruins would probably continue unmolested for ages; but time and man have falsified his prediction. In 1806 a house was built over a portion of the vaulted work. The so-called cellar and the seven-sided building still remain, the latter being what is now called the Abbot's Tower. Mr. ROWE was of opinion that it is a domestic building of some kind. It is square, of three storeys, with a cellar under, with fire-places, garderobes, and a well; there were staircases with landings on every floor. The entrance appears to have been on the south of the first floor.

This building was clearly shown on the plans exhibited by Mr. WALTERS, and, as Mr. MICKLETHWAITE suggested, was probably devoted to the guests of the abbey, of which there were three grades usually. One, those who received daily doles at the gate; another, who had inferior lodgings to those whom the abbot delighted to honour, and who had probably a prescriptive right to entertainment within the walls.

The plan of the church, as far as shown, differed from the usual plan of a Cistercian church in the length of the eastern limb of the cross, and in there being a thick double wall at the eastern end, with a T-like recess, to which no use could be assigned, though this feature is common in many ecclesiastical edifices in Ireland. At the south-western angle of the nave and south transept a heavy mass of masonry has been found, and at the first glance it appeared that this and the eastern end were the remains of the older foundation. The hypothesis of Mr. MICKLETHWAITE, that it was probably the foundation of the stairs leading to the conventual buildings, scarcely accounted for this unusual feature. There was another feature of singular interest. The nave was divided from the side aisles by the foundation of a solid wall, on which the piers of the arcade were built. This, though it has been observed before, is not common in the later Cistercian abbeys. Mr. MICKLETHWAITE pointed out that the nave was always divided from the aisles in the houses of the white monks; and in a celebrated Cistercian nunnery which still exists in Spain, the wall is carried up some three feet; but in England the division appears to have been of wood, as is evidenced by the remains at Fountains and other of the Yorkshire abbeys. The cellars mentioned were undoubtedly the cellarium—the *domus conversorum* of the late Mr. EDMUND SHARPE—which occupied the western side of the cloisters, and the dormitory of the numerous conversi was on the floor above.

Some portion of the grange remains, and the arches apparently of the entrance, but the gatehouse has gone. The cemetery appears to have been on the eastern side of the house built in 1806, as graves have been found on the lawn. The ruinous materials which Mr. LASKEY thought would remain as a monument for ever have been used to erect a mill, which occupies the site of some conventual buildings, for these monks were the pioneers of industrial occupation in the higher parts of the Dart, and their influence is yet seen in the woollen mills of this part of Devonshire. Portions of some tiles and two spoons found during the excavations were exhibited, and a vote of thanks to Mr. WALTERS closed the proceedings.

## ART FOR SCHOOLS.

IT indicates a vast change in our educational system when we find an Association formed for the purpose of securing the introduction of works of art into ordinary schools. There was a time when it was supposed that bare walls helped a boy or a girl to concentrate attention upon the teacher's lessons. A school having a claim to be considered historical had, according to the masters, associations enough about its stone and wood to satisfy the affections. Like Old BOWYER, they were ready to declare that the school was father, mother, sister, brother, first cousin, and second cousin to every one of the pupils, and woe be to the unhappy youth who refused to be convinced. In course of time the bleak walls were covered with diagrams relating to geography and mechanics, and so little satisfaction was derived from gazing on them by boys

or girls that even the most conservative of teachers could not object to their introduction.

This change from bare to adorned walls is, however, no more than was to be expected when old-fashioned and modern school books were compared. One of the differences between them is the abundance of illustrations in the latter. The old books were grim enough, and corresponded with the educational modes then in use. The pupil was supposed to be able to understand all the references to Greek and Latin arms, dress, houses, and every-day life without the aid of a woodcut, and to realise things which he had no opportunity of seeing from the scanty descriptions. Can it be said that the modern school books are less useful than those which were in use forty or fifty years ago? Some masters might be discovered who would say that a good author needs no pictures, but the majority of teachers would hardly care, even if it were possible, to restore the books with which they were made familiar in their own school days.

It will be said that the illustrations in school books are intended to serve as expositions of the text, and that they differ in character from the prints which are recommended by the Art for Schools Association. A master from a grammar-school or a Board-school would be sure to maintain that the majority of the examples shown in Bond Street are beyond him, and would be certainly beyond the understanding of most scholars. About engravings which represent *The Defeat of the Spanish Armada*, *The Princes in the Tower*, *A Distinguished Member of the Humane Society*, *Hauling the Line*, *Little Customers*, and *School Revisited*, there would be no difficulty. But what is to be thought of the photographs from Mr. BURNE JONES's and Mr. WATTS's symbolic pictures, of PINTURICCHIO's *Library at Siena*, BELLINI's *St. Jerome in his Study*, MEISTER STEPHEN's *Triptych*, and GHIRLANDAIO's *Zacharias*? There is no question of their interest; but, unhappily, it is not every adult who can sincerely admire them, and it may be supposed that they do not appeal more directly to the youthful mind. An incipient RUSKIN would probably be ready to worship them, but it remains to be ascertained whether ordinary boys could appreciate them. Unless it is a genuine admiration that is felt, the works had better be absent. Honest ignorance or indifference is better than an affectation of connoisseurship in young folks, and cricket seems a better topic for discussion than the merits of PIETRO PERUGINO.

The directors of the Association evidently believe that a copy from a work of art must exercise a beneficial influence on all who see it, and their faith in what the French call "la puissance de la Beauté" is certainly praiseworthy. They are making an experiment which, although it will seem labour in vain to the advocates of what is known as "a sound education," may lead to important results. Why should art (unless paid for as an extra) be excluded from the school curriculum? The answer would be that the tendency of education is now towards intellectual matters, because in the end they are more profitable. But this is taking a partial view of the scope of education, which should aim at the development of all the faculties, including imagination and the sense of beauty. In France, although a matter-of-fact spirit prevails among the authorities, and religious and other emblems have been removed from all the public schools, a sort of revolution has taken place in regard to the adornment of school-rooms. Artists of repute have received commissions from the public funds for pictures to be placed on the walls. It is remarkable that in the collection exhibited by the Art for Schools Association there is only one work which was specially designed for a school; and it comes from France, namely, the copy of M. DIDIER's fine frieze which was published in *The Architect*. A picture may be supposed to have some use in a school when the French Government are willing to pay the first animal painter in France for a representation on a large scale of scenes in country life in order to gratify the eyes of Paris boys. If the experiment of the Association succeeds, we may one day see the School Boards in this country following the French example.

As the Association has at present only a small room at its disposal to hold an exhibition the number of examples is necessarily limited, but we may assume that they represent the class of works which would be recommended by the committee for adoption in public and private schools. It is evident that, with few exceptions, everything relating to broil and battle has been on principle excluded from among the figure pieces. Indeed it may be said that with exception of Mr. MILLAIS's

*Princes in the Tower*, and *The Huguenot*, representations which are suggestive of pain are absent. The classes of works approved by the committee are limited to "pictures of simple natural objects, pictures of animals, pictures of peasant and artisan life, pictures of famous architectural works, landscapes and sea pieces, historical portraits, scenes from history, and reproductions of suitable subjects among the works of the great masters of English and foreign schools." There is ample room in these classes for a large variety of works, from copies of renowned pictures to sketches of flowers. But it would be well to discover whether the range might not be extended with advantage, and for this purpose the opinion of boys and girls should be considered. It may be safely asserted that boys would prefer engravings of MACLISE'S *Waterloo* and *Trafalgar* to those of TURNER'S, COROT'S, or LINNELL'S landscapes, and to the copies of most of the old masters. Whether their admiration of battle pieces is ill-advised and should be checked is a question for moralists to decide. Town boys would be attracted by pictures of country life, and the wisdom of the French authorities, in adopting M. DIDIER'S frieze for a Paris school, is unquestionable.

It may be assumed that the introduction of a series of works of art in an English school would at first give rise to more or less distraction, but after a time there would be desire for other works. In schools, as well as in nurseries, children must have something new if they are to be pleased. But there would be little difficulty in an interchange of engravings between the schools of the district. A series of groups which has been devised by the committee would, besides guiding authorities in their purchase, enable them, if they co-operated, to secure a variety sufficient for any change of subjects that might be necessary. It is astonishing how little a collection of suitable works would cost. Out of the thirty-nine groups in the Association there are only two which amount to five pounds each. For 2*l.* 15*s.* 6*d.* a school can acquire RAPHAEL'S *Belle Jardinière* and a study, two studies by LEONARDO DA VINCI, one by LUINI, HOLBEIN'S *Meyer Madonna*, and JULES DIDIER'S long frieze. For 4*l.* 5*s.* 4*d.*, in addition to the frieze, there would be Mr. MILLAIS'S *Huguenot*, GAINSBOROUGH'S *Blue Boy*, two examples by LUCA DELLA ROBBIA, and others by RAPHAEL, FRA ANGELICO, TURNER, and RICHTER. In some of the schemes the excellent toy-books of Mr. CALDECOTT and Mr. WALTER CRANE have been utilised with advantage. Opportunity is consequently given to benevolent people to do a permanent good to their young neighbours by a very small outlay, and the cheapest set of works would be an acquisition which any school might be proud to possess. It may also be remarked that many people who are about to purchase engravings for their own houses will find it an advantage to follow the selection of the Association, which does not include a single example of meretricious work.

### PARIS NOTES.

THE exhibition of drawings and sketches by masters of the present century will be opened at the Ecole des Beaux-Arts on Monday, the 4th inst. This exhibition, which is being organised under the auspices of the Society of French Artists, is to be entitled L'Exposition des Dessins du Siècle, and will thus form a sort of pendant to that of Les Portraits du Siècle, lately held in the same galleries. A committee consisting of the most eminent French artists has been entrusted with the task of choosing the exhibits from among the mass of drawings that have been sent in from every part of the country. It is expected that the principal masters of the first half of the century will be very largely represented.

An important improvement is about to be introduced in the French national museums. The director of Fine Arts has arranged for the publication of a popular catalogue, containing all the information necessary for the general public at a very low price; while another and more complete one, giving the fullest details respecting the origin and past history of the various works, with other information of interest to amateurs and critics, will be brought out at the same time. Several of the popular catalogues will, moreover, be placed on the tables in every room of the museum for the free use of visitors. An arrangement has also been made for the

reproduction, by means of photography, of 7,000 of the best paintings in France. Copies of these are to be sold at popular prices, and, after thirty years, the right of reproduction will lapse to the State.

M. Louis Leloir, the well-known artist, has died in Paris. Of late years he had devoted himself almost exclusively to water-colours, some of which have been reproduced in *The Architect*. He also executed a series of illustrations for the *édition de luxe* of Molière, lately published by M. Jouaust. For the thirty illustrations of the work he received 15,000 frs. (or 2*ol.* a-piece). Examples of the original drawings have appeared in *The Architect*. When an exhibition of his drawings was held last year, the publisher refused to part with the originals for a large price.

The death is also announced of M. Augustin Alexander Dumont, the sculptor. He was born in Paris on August 14, 1801, and was consequently in his eighty-fourth year. M. Dumont was elected to the Académie des Beaux-Arts in succession to Rosney, sen., and was named professor at the School of Fine Arts when that institution was reorganised at the end of 1863. The deceased was more illustrious through his pupils than by his own creations, for he may be said to have contributed greatly to forming the galaxy of brilliant artists that are now the glory of French sculpture. M. Dumont received the red ribbon of Knight of the Legion of Honour in 1836, was promoted Officer in 1855, and Commander in 1870.

The exhibition of Manet's works at the School of Fine Arts closed on Wednesday, when admission was free. The receipts have been far less than was expected, having averaged only 500 to 600 frs. per day. This is a poor result, especially when it be considered that the great majority of the works had to be framed expressly for this exhibition, at a total cost of nearly 20,000 frs.

The windows of the two upper storeys of the new Hôtel des Postes are now put in and glazed, so that the painters and decorators have been able to commence operations on this portion of the vast building. The authorities have given orders to push on the work with all possible speed, as it is intended to inaugurate the new Post Office on the occasion of the national fête on July 14. To this end electric-lighting apparatus is being put up, to enable the painters, &c., to continue working all night.

The organ *Les Petites Affiches* publishes the deed of sale by which the city of Paris effects the purchase of the property comprising the Arènes de Lutèce in the Rue de Navarre. The ground occupies 6,963 square mètres, and the sale price is 1,200,000 frs. The committee charged with the clearing of the Arena, and consisting of MM. Read, De Menorval, De Vogué, De Lasteyrie, Cernesson, Rey, Delaunay, and Dusseigneur, held a meeting last week, at which a report was read showing the progress already made in the work of excavation directed by M. Ruprich Robert. The stage and adjoining space have been cleared, the line of the *podium* (the surrounding wall of the arena) discovered, as well as many remarkable sculptures and numerous skeletons, and temporary sheds erected to afford shelter from the weather. About 3,000 cubic mètres of earth have been taken out up to the present time.

The heavy work on the Hôtel de Ville being now completely finished, it has become possible to count the exact cost of the new municipal palace. The masonry work, properly so called, is found to come to a total of 12,092,002 frs. In this amount is included a sum of 300,000 frs. allowed to the contractor as an indemnification for losses occasioned by circumstances beyond his control. Thus 10,185 frs. is counted for delays caused in the transport of material by the interruption of the canal navigation in 1879, and 64,000 frs. for losses arising from the severe and long-continued frost in the winter of the same year. It is calculated that altogether a further outlay of five or six million francs will be requisite to complete the sculptures and internal decoration of the building.

Important works of repair have lately been commenced at the Château and Park of Versailles. A long period of neglect has allowed the reservoirs, pipes, and other apparatus for supplying the grand fountains to fall into such a state of dilapidation that the whole system for some time past has shown signs of breaking

down, and the authorities have at last been absolutely forced to take the matter in hand. The heaviest work to be done is in connection with the Neptune Basin, and, as it can only be taken in hand by sections of a quarter at a time, it will scarcely be finished before the end of 1887. Thus the numerous foreign and Parisian visitors that flock to Versailles to see the *grandes eaux* whenever they are announced to play, cannot expect to again see them in all their completeness for upwards of four years to come. The repairs on the Dragon Basin—known also as the *Bassin de la Victoire*—and the Pyramid Fountain are being carried out with all speed, so as to render it possible during the coming summer to give a display in some way worthy of the traditional renown of the Versailles fountains, and these will probably be out of hand by the beginning of May. In connection with the Dragon Basin, the marble flight of steps in the northern garden is being thoroughly restored, and after this part of the work is completed, the Obelisque, or Hundred-pipe Basin (*Bassin des cent-tuyaux*), will be undertaken. In the château itself, the marble court is being relieved of all the excrescences that have been crowded into it in the course of years, and restored to its original condition. In this court “*Alceste*,” the opera of Lulli and Quinault, was played for the first time in 1674, and 115 years later Marie Antoinette was obliged, in obedience to the desire, or rather the imperious clamour, of the people, to show herself unattended on the first-floor balcony.

### THE CONSERVATION OF PICTURES BY SIR JOSHUA REYNOLDS.

THE following interesting letter has been contributed by Mr. J. C. Robinson on the present state of Reynolds’ portraits:—

Among the admirable Sir Joshuas at the Grosvenor Gallery, the well-known full-length portrait of *Mrs. Pelham Feeding Chickens* has been greatly commented upon in art circles and in the press as a disastrous example of picture-cleaning vandalism. The picture certainly has been thoroughly cleaned. Whether the state of the work really necessitated that operation I know not; but, assuming that it did, I do not think the operator, whoever he was, has been guilty of so great an enormity as is generally supposed. Though wofully transfigured, and that, of necessity, for a long time to come, the picture in question has, I think, suffered no permanent—i.e., irretrievable—injury. This, however, is more than can be said of several other works in the exhibition. If I may be allowed a brief space in the *Times*, I think I can render some much needed service to the possessors and lovers of pictures by Sir Joshua Reynolds in offering information as to the causes of detriment and suggestions for their better preservation of such works in future. I think it may be assumed that in the whole range of pictorial productions, ancient and modern, there are no works which, for their safe keeping, involve more difficult problems than those of Sir Joshua Reynolds. This arises from very obvious causes. In the first place much of the onus attaches to the painter himself. Sir Joshua’s works from the beginning were, as a rule, endowed, so to speak, with frail and delicate constitutions. His practice was of the most uncertain and unsettled nature; one continual course, in fact, of casual experiment unguided by the light of science, and directed solely to the attainment of immediate results, without any thought for the duration of his works. As a natural consequence, they afford typical examples of almost every ailment, almost every form of inherent tendency to decay, to which pictures are liable. A considerable proportion of them, indeed, must have begun to die, as it were, from the moment they left his easel.

Then, again, Sir Joshua Reynolds’s works were produced, and have ever since remained in a country which of all others has a climate the most unpropitious and unsuitable for the preservation of art, and where, moreover, the modes of housing and living with these treasures have been additionally inimical to their well keeping. Lastly, perhaps in no country has there prevailed greater ignorance and recklessness among the people who have had to do with pictures—that is, as picture-doctors; in other words, cleaners and restorers.

There is nothing like seeing with one’s own eyes, and the present exhibition offers a unique opportunity for the observation and study of the state of Sir Joshua’s pictures, as they have come down to us after the chances and changes of a century or more. I purpose, then, to “improve the occasion” by directing attention to particular works now before the public. Let us, then, begin with this *Mrs. Pelham* portrait, No. 9, painted in 1770, and at the same time associate with it No. 125—a similar whole-length portrait of *Lady Stanhope*, produced a few years earlier (1765–66). The present aspect of these two pictures is literally as different as light is from dark. The former, a recently-cleaned picture, now

presents a raw spotty aspect, entirely destitute of that transparent golden glow which overspreads so many of the beautiful works around it; but No. 125, on the other hand, is enveloped in Cimmerian darkness. Only with difficulty can the leading details of the composition be discerned through the dense brown envelope which enshrouds it as in a London fog. Nevertheless, this picture was originally scarcely less lightsome and brilliant than the *Mrs. Pelham*, and if it could be skilfully cleaned it is possible that it might yet be brought back again almost to its pristine state. It must be clearly understood, then, that the amazing alteration which has taken place is almost entirely due to the darkening of dense coats of varnish which have from time to time been superimposed upon the picture. But the majority of Sir Joshua’s productions are more or less afflicted by an inward malady, more serious even than this plague of superadded darkness; and when the two evils are combined in full measure in the same work the case is usually hopeless. The malady in question is in its nature incurable and progressive. All that can be done is to try to keep it within bounds. Everybody will have noticed that the dark pigments, mainly in the backgrounds, draperies, &c., of Sir Joshua’s pictures, are painted in an unusually thick, full, “impasted” manner, and that these passages are often strangely cracked and corrugated, and nearly always dull and sombre. Often when the faces, hands, and other more lightsome parts of his portraits are in excellent preservation, the hair, dark backgrounds, and other low-toned passages have become disfigured by a network of wide-yawning crevices, or rippled, wrinkled foldings, which, by reflecting the light from the unequal surfaces, produces a disturbing effect, destructive of the proper “keeping” or harmony of the work.

For these drawbacks the painter himself is mainly responsible; they have arisen from the use of unsuitable colours and vehicles. The basis of the rich and splendid brown tints which, from emulation of Titian and Rembrandt, had such a fascination for Sir Joshua, is asphaltum or bitumen, and the medium with which it was combined most frequently an incongruous mixture of linseed oil varnish, and wax; but the pigment thus composed, and the endless admixtures of it with other colours seen in Sir Joshua’s pictures, are all more or less changeable and otherwise obnoxious.

The evil properties of this pigment when applied, as it often was by Sir Joshua, pure and simple and in great “body” are these. In the first place, it never becomes really dry and hard like other oil colours; then, as it partially dries on the surface, it contracts rapidly in bulk, whereby ensues the shrivelled, corrugated condition. After a certain time these corrugated portions, especially when overlaid with other vehicles, develop into cracks, constantly opening wider and wider, and, lastly, in time the pigment loses its original depth of tint and transparency and becomes opaque, “horny,” and black. In short, the obnoxious changes have no limit, and endless new developments may occur as varying external influences act and react upon it.

Nor is this by any means the only special cause of deterioration with which Sir Joshua’s works are afflicted; but to follow out this particular thread would involve a complete technical treatise. Let us now again consider the outward applications for which the successive curators of Sir Joshua’s pictures, rather than the painter himself, are responsible.

In Sir Joshua Reynolds’s time, but more particularly during the early part of this century, very peculiar notions prevailed as to the proper presentable aspect of oil pictures. The “old masters” were then all in all, and dark pictures and rich, low golden tones were exclusively admired. One of the great arbiters of taste of that time, Sir George Beaumont, even laid down the absurd dictum that a perfect picture should have the dark golden-brown hue of the back of an old fiddle. In response to this requirement pictures were often defaced with artificial tonings or coloured washes of the most heterogeneous nature, and with varnishes tinted with colouring substances. All this was, of course, utterly short-sighted and wrong.

It is undoubtedly quite necessary that the surface of pictures should be protected with varnish, for patent reasons of which I shall say something hereafter; but this protecting varnish should be transparent and colourless, and, above all, of such a nature as to admit of being removed, if necessary, without any risk of injury to the delicate surface of the work beneath. Now it may once for all be stated, and the fact should be fully borne in mind and understood by all who have to do with pictures, that there is only one kind of varnish known which properly fulfils these requirements—pure mastic; and it is scarcely too much to say that no other substance of any kind ought ever to be applied as a protection to pictures. I think this fact is now generally acquiesced in by all really intelligent picture-restorers; but, unfortunately, in past times an infinity of deleterious mixtures was recklessly employed, and a *damnosa hereditas* of infinite complexity has been thereby entailed upon us.

Probably, mainly in response to this unreasoning predilection for dark-toned pictures, a practice arose of the employment of a kind of varnish which, although transparent and colourless when first applied, was known to have the property of speedily acquiring a deep golden-brown tone by inherent chemical change—in reality progressive discolouration, to which there is no limit but utter

darkness. Nor was this the only objectionable quality of this varnish; worst of all is the fact that this substance becomes in process of time so hard and obdurate that it is a most difficult and dangerous task, often an impossibility, to effect its successful removal. Yet, alas! the great majority of Sir Joshua Reynolds's pictures have been eclipsed by this fatal envelope.

This medium is what is known as oil varnish—that is, mastic mixed in varying proportions with boiled linseed oil. Now this vehicle is practically identical with that used by the painter in the execution of his work, and when applied to the naked surface of a picture it adheres firmly and speedily becomes part and parcel of and homogeneous with it. In such cases any attempt to remove this varnish when discoloured must inevitably result in bringing along with it more or less of the delicate surface work of the picture—in other words, those final touchings and glazings which are often its chief grace and glory. I fear these technical notes will have been found somewhat tedious; they are, however, essential to the elucidation of the subject, and how important this question really is will be obvious when it is considered that hundreds and thousands of fine pictures are daily and hourly perishing from easily preventable causes. In the reign of ignorance which now prevails, indeed, the reckless hands of some crass mechanic or the foolish fancies of an ill-informed or crochety owner may at any time, in a few brief minutes even, deprive the world of the noblest masterpieces of a Titian or a Raphael, a Rembrandt or a Reynolds.

### LANCASHIRE ARTISTS.

A PAPER was read by Mr. J. H. Nodal at a meeting of the Manchester Literary Club on Monday. It referred to a list containing the names of seventy-six deceased Lancashire artists. Of these thirty-one were natives of Manchester, twenty-four of Liverpool, four of Preston, three of Bolton, three of Warrington, two of Dalton-in-Furness, two of Lancaster, and one each Bury, Prescott, and Urswick, near Ulverston. Three others are set down as born at Glossop, but they lived in Manchester, and two of them were baptised in that town. Again, of the seventy-six names, sixty-six were painters, three architects, three engravers, two sculptors, and two women painters.

The earliest of the Lancashire artists appears to have been Hamlet Winstanley, who was born in Warrington in 1696, and died there in 1756. He studied in London under Sir Godfrey Kneller, and also for a little while in Italy, and appears to have spent the greater portion of his working life in painting for the Earl of Derby at Knowsley. Many of his productions—family portraits and views of the neighbourhood—are in the Knowsley collection; and he executed twenty etchings from the works of the old masters in that collection. Horace Walpole entered him in his "Anecdotes of Painters" as an engraver only, and Redgrave copied the error into his "Dictionary of Painters," and it is due to Mr. George Scharf, the secretary of the National Gallery, that the mistake has been rectified in our own time. Mr. Scharf speaks of Winstanley's etchings as "remarkably spirited," and they justify Walpole in classifying him among engravers, but not for the exclusive classification, for, says Mr. Scharf, "Winstanley's sketches of Rome and studies of antique figures are very masterly." Standing first in point of time, almost alone, in the annals of Lancashire art, Hamlet Winstanley is connected with the later records in consequence of his tutorship of George Stubbs, who was born in Liverpool in 1724, and rose to be an associate of the Royal Academy in 1780, and a full Academician in 1781. Through some informality his appointment as an Academician was never ratified, and he accordingly always appears in the notices as an associate only. He, however, always claimed the dignity, and insisted upon it. Few painters have had less justice done to them, and it is only of very recent years that his great merits have been conceded. The Lancashire painters who have succeeded in entering the portals of the Royal Academy are only four in number, namely:—George Stubbs, Associate; George Romney, R.A.; Joseph Farrington, R.A., Frank Stone, A.R.A. The following living men may be added:—Richard Ansdell, R.A., Thomas Oldham Barlow, R.A., Luke Fieldes, A.R.A., Alfred Waterhouse, A.R.A., Henry Woods, A.R.A. Until the beginning of the present century the number of native artists was extremely small. Most of these migrated to London and remained there. In 1773 the first public effort for the encouragement of art was made in the county by the formation of "the Society for Promoting the Arts in Liverpool," with Mr. Blundell, of Ince, as president, and Roscoe, the historian, as vice-president. It held one exhibition, and then its further progress was stayed by the American and French wars, which half ruined Liverpool, until 1783. Then there was a brief revival, one exhibition being held in that year, and another in 1787. War again intervened. The Society of Artists disappeared; and it was reserved for a much later period in the present century to re-establish the exhibitions in Liverpool. In Manchester such exhibitions date from the opening of the Manchester Royal Institution in 1830. For the first forty years of the century Lancashire furnished a poor and precarious market for the work of the painter, and indeed an artist was com-

pelled to depend for his livelihood either upon the painting of portraits or the teaching of drawing. Men like Bradley, Faulkner, Liverseege, and Towne, though they maintained their connection with their native shire, found it necessary to move to London and spend most of their time there. As a consequence of this state of artistic affairs it will be found that the lives of those artists of whom we have any adequate record, with the exception of Romney and one or two others, were lives of considerable hardship, anxiety, and small pecuniary success. It is interesting to note that two of our Lancashire artists—Joseph Farrington, R.A., and William Green—were among the first to disclose the beauties of the Lake country by means of lithographic or engraved views from their drawings. Farrington's twenty views appeared in 1789; they were more than doubled in number in subsequent editions, and were frequently re-issued. William Green's series of sixty views, "illustrative of the most beautiful scenery in the Lake district," were issued from Ambleside in 1814. "A Guide to the Lakes, Mountains, and Scenery," in two vols., was published in Kendal in 1819, with a large number of sketches, and the Rev. Richard Loxham, writing in the "Manchester School Register," vol. 3, describes it as "still by far the best and most minute guide to the lakes, mountains, and scenery."

Mr. Nodal further stated that the list and the materials for the biographical dictionary of Lancashire artists had been collected in consequence of the initiative of the club, and the manner in which it was to be utilised still remained to be decided. After some conversation it was agreed to recommend to the council to issue a hand-list of deceased Lancashire artists, and to circulate it in order to obtain additions and corrections with a view to publication at a future date.

### LYCIAN ART.

THE fourth of Professor Newton's lectures at University College, on Lycian Art, treated of the rock tombs. Of these tombs there were, he said, three principal classes, *heröa*, with Ionic façades cut in the face of the rock; tombs which seemed copied from a wooden structure resembling a block-house with a flat roof: and tombs copied from a wooden structure, and surmounted by a roof in the form of a Gothic arch. The tombs resembling a block-house with a flat roof were those which Fellowes in his "Lycia" calls Elizabethan, because their façades cut in the rock resemble the square-headed windows, with mullions of Elizabethan architecture. The tombs with arched roofs were, so far as the lecturer knew, peculiar to Lycia. The structure of the roof was evidently copied with literal accuracy from a wooden original. On each side projected two boldly-carved lions' heads, in each gable panels were let in, on the apex of the roof was a vertical ridge, either end of which had been ornamented with a bull's head. Two examples of this type of tomb might be seen in the Lycian Room in the British Museum, one on either side of the passage leading to the reading room. Both were ornamented with sculptures in relief, and had inscriptions in the Lycian character. On one of these tombs was a name which had been read *Paiafa*, and which, it was thought, was the name of the personage to whom the tomb was dedicated. On the four sides of the lower part of this tomb were the following sculptures in relief. On the south side was a satrap seated in a chair ornamented with lion's feet. In front of him stood three male figures, and behind him another figure, thought to be female. On the north a mounted warrior, followed by three horsemen, attacked three warriors on foot armed with spears. Behind them a fourth, issuing from behind a rock, raised his hand as if encouraging the others. A wounded figure lay prostrate under the mounted warrior's feet. This scene seemed to represent an attack by ambuscade. At the west end was a bearded figure raising his hand to the head of a naked youth, as if crowning him. The youth might be a successful athlete being crowned after his victory. At the east end were two bearded warriors wearing cuirasses, one of whom raised his hand over the head of the other. There were the decorations of the part of the tomb which might be considered as the sarcophagus itself. On the roof were the following representations:—At the west end, in the panels within the gable, were a pair of sphinxes, and beneath, in very low relief, was a group of a veiled female, to whose side a naked boy clung, looking towards a bearded man holding a sceptre. In the east front within the gable, were a pair of sphinxes, and below a group too indistinct to be made out. On the arched roof on either side was a chariot group. A youthful figure drives four horses attached to a chariot, into which a bearded warrior was stepping. On the ridge which crowned the apex was, on the north side, a relief representing a battle, in which five combatants on foot fly before a mounted warrior, on the right, who was followed by another mounted warrior, attacking a foe fallen on his knees. The lecturer regretted that in consequence of the wholly inadequate space in which this tomb was exhibited, the sculptures of the roof were very imperfectly seen on one side, and wholly invisible on the other. He was sorry to say that he must refer any person who wished to see those sculptures to the Museum of Casts at Berlin, where they

might be studied under light denied to the originals, and he took this occasion to animadvert on the niggardly allowance of space meted out to the sculptures in the British Museum, when compared with the ample galleries of the Louvre; the museums at Berlin and Rome, and those of other much poorer countries abroad, when they acquired fine sculptures, did not stow them away in sheds and cellars, but housed them in a manner worthy of such precious remains. Returning to the description of the tomb of Paiafa, the lecturer said that the inscription on it as interpreted by Savelsburg, did not very satisfactorily explain the subjects of the various reliefs, but they probably represented various scenes in the life of Paiafa, his exploits in war, his recreations in peace. Some of the figures might be his ancestors, whom the Greeks supposed to be always present with them. With regard to the peculiar type of these tombs, with arched roofs, the suggestion of Semper, in his "Tektonik," was well worthy of consideration. He thought that the original wooden structure from which they were copied, was a coffin with a high roof, like a catafalque, the panels of which were ornamented with paintings and hangings, as was the case with the funeral car of Alexander the Great. He was glad to find that Professor Hayter Lewis was disposed to agree with this suggestion.

## BUILDING RISKS AND THEIR INCIDENCE.\*

BY T. M. RICKMAN.

ALL building works involve risks—risks to builders, risks to employers. The risks usually considered to attach to builders are:—Changes in price of labour, enforced at times by strikes; alteration in the efficiency of labour; changes in price of materials; the difficulties arising from having to obtain special materials in place of those usually procurable; the state of the bottom obtainable for building, and the consequent extent of the foundations of the proposed structure; the use of materials from the estate, such as bricks, stone, timber, and the value of them for the purpose of the erection; the state of the adjoining premises as affected by the proposed works, and the condition and value of the old materials which may have to be reused; risk of irregularity of payments, and the failure of the employer; penalty as to time of completion; risk of accident to the public and to workmen employed; the idiosyncrasies of architects, as shown in their explanations of their own terms; the unexpected views of the intentions of the legislature by the administrators of Acts of Parliament; the whims of clerks of works; the danger of inaccuracies in the estimates.

The risks usually considered to attach to employers are:—Excess in cost over the contemplated expenditure; delay in completion beyond the anticipated period, occasioned by strikes, tempest, frost, or other inclement weather, and other causes, and the possible want of occupation for the building in consequence of such delay, involving sometimes the loss of anticipated business; delays and difficulties from the failure of the builder; defects in workmanship and material, after all precautions taken; in case of the employment of an architect strange to the locality, his non-acquaintance with local customs and materials.

Though these several risks may be divided into two classes, they are originally all those of the employer; he engages an architect to minimise them for him. Some of them he can get rid of, others remain. If he throws on the builder unreasonable risks (*sporting* items in the bill of quantities), he must pay heavily for getting rid of them. There are cases in which risks can be transmitted, and others where they must be retained. Whoever draws up a reasonable contract will not endeavour to throw unreasonable risks on to the builder. The experience of builders varies as to what they will undertake as risks, and difficulties are sure to ensue if builders undertake risks with the bearing of which they are unacquainted.

Before considering the relative advantages of different modes of contracting, some observations are here offered on the mode of dealing with the several risks above mentioned.

The risks as to variations in prices and efficiency of ordinary labour and materials should lie with the builder.

The employment of "other tradesmen," specially named by the employer or architect, for portions of the work, introduces fresh difficulties for builders, and makes it almost impossible to carry out the works by the intended date of completion, as such tradesmen are not usually bound to time in the same manner as the general contractor, and the latter has not usually the power of making a free contract with them.

The extent of foundation required is usually a risk retained by the employer. It is often possible to obtain extra accommodation from additional foundations which is to the employer's advantage. It is sometimes almost impossible to execute works in foundations which, in the first instance, it seemed reasonable to propose.

The works to adjoining premises, including party-walls, are invariably attended with risks which generally should be retained,

but must sometimes be transferred. The liability occasionally arising to rebuild, instead of repairing, a party-wall, and the expenses in consequence, including that of removal to the adjoining owners, may be so greatly varied in execution, that the possibility of transferring the risk to the builder by any usual clause is more than doubtful.

The amount of the penalty inserted in a contract for delay in the completion of the works should be based on some equitable principle, and should be commensurate with the loss from non-occupation. This may be calculated, as interest on money expended, in some cases on buildings only, in others on buildings and site, and there are cases where the value of expected trade may be introduced; but, in the latter case, it would seem reasonable that it be mentioned in the contract.

The time allowed for additional works should be allowed in case of variations, on the whole amount altered or reconsidered, and cannot practically be calculated on the value of net extra cost alone.

The present increased actual value of land, and the increased proportion which the value of the site now bears to the total cost of town buildings of which it forms a part (and which value has to be considered in many instances in calculating the amount of penalty), has led to haste in the conduct of the work, to throwing points of detail over until the time comes for their execution, and to the drawings and specification being incomplete and really insufficient either for estimating or for carrying out the works.

Such being risks attendant on the erection of most buildings, there are cases in which employers increase their risks by the course of their proceedings. A public body erecting a building of a new sort increases the risks by introducing the element of an architectural competition for the design, and by stating a fixed sum as the principal guiding element in the conduct of the works.

Another case is that where there is a contract for an entire work, with the rates applicable by special clauses to future variations, and where risk of complication is introduced by every separate private bargain made in the course of the works either by the architect or by the employer with the builder. Such agreements are most difficult to interpret, and, even if clearly defined, introduce two separate systems of settling a value for the same work.

Another element of risk is introduced by changes in the plan or in the class of work to be used, made after the receipt of the tenders and before the contract is signed; such changes, if considerable, complicate the accounts and are most difficult of statement in revising the drawings and specification. Reasonable care may make quantities and specification hang together if written continuously, but it is to be doubted if it is possible so to alter a specification for a large and complicated building, which has been accurate at first, as that it shall be correct after considerable variations have been introduced.

And here may be considered that element of professional responsibility which is so generally introduced in the conduct of works, and which should result in the proper distribution of risks between the employer, the architect, the surveyor, and the builder.

An employer building on his own estate employs his own men and materials. If erecting a new building, he takes all risks himself, and those risks are the least possible in quantity. If altering an old building, the risks are greater, the uncertainty as to time to be occupied by the works is increased, the cost of the works is greater, and the difficulty of sub-letting portions or trades, if the proprietor is disposed to do so, is increased.

If a building is erected in a town, there are the further risks of dealing with adjoining properties and with public authorities. These require special knowledge, and builders are to be found who will take these risks as an ordinary business, and also the responsibility of the working up the whole into a complete house or building, such responsibility being expressed by the laws relating to contract for the production of a complete chattel.

If the employer requires special architectural design, an architect is employed, who is the agent of the employer, and is responsible to bring larger knowledge of dealing with risks to bear on each subject than either the employer or the builder may possess. In arranging a contract under such circumstances, the cost of materials and labour is to be supposed to some extent to be known by all parties, and a profit is added to cover the risks which cannot be particularised, and for the reward of the builder.

Employers, and with reason, generally doubt the expediency of placing a contract in the hands of a builder without competition, hence the system of tendering; and, were the specification always clear, and no sporting risks introduced, each builder tendering would prepare his own estimate; but the multiplication of these more difficult risks, and the want of exactness in defining them, are some of the reasons for the introduction of an intermediate person who himself takes the risk of the quantities, and furnishes them, as far as they can be accurately measured, and whose business it is to point out the nature of all sporting risks which may be contingent on the contract.

It is very difficult to define some of these risks, as it is difficult to define the modes of construction intended to be adopted, and when severe competition is introduced it becomes at some time a

\* A paper read at the ordinary general meeting of the Surveyors' Institution, January 28, 1884.

question what is to be considered the contract with reference to such matters. What the architect intended to express may not be the fair meaning of the words he used, and so his intention may not be the explanation of the contract.

Upon the fair rendering in the quantities of the terms stated by the architect depends, most likely, whether or no the builders tendering take sufficient pains to ascertain beforehand what these risks are.

If all of the risks are not stated in the specification, except under general headings, if all of them are not ascertained by the measuring-surveyor in preparing the quantities, it would seem questionable whether the builder who contracts for the work is responsible for such risks so omitted, and, if not, it would seem that they are still on the shoulders of the building-owner.

Reviewing the history of the course of business, we find—1st. The architect employed by the building-owner, employing workmen; all risks being at the cost of employer. 2nd. The architect and builder combined, with or without contract, the employer, by selection of an architect, devolving on him, as he might think, all risks, but in that probably mistaken. 3rd. The employment of an architect, and under him of contractors for separate trades or of a builder for all trades. Both parties recognised by the employer, with larger chance that all the risks should be transferred from the employer, but with a probability that some of them may reach him after all. 4th. The introduction of a quantity-taker either unrecognised by the architect or employer; or recognised by the architect, not by the employer; or recognised by the employer; or appointed by the employer: with a further complication in the three last cases, not unfrequently introduced, by the fact of the architect being the quantity-taker.

In each of the above-mentioned cases, more or less of the risks are become the responsibilities of the several parties engaged by the building owner; but if any one of them, architect, quantity taker, or builder, have not done their duty in preparing the contract and the estimate therefrom, and, as is also possible, if the employer has not assisted as he ought, such neglected work may make a sore place in settling up the accounts, and the employer may find himself still involved in risks which he thought to have transferred.

A knowledge of the relative positions occupied by these several parties is gradually reaching the class of persons who are likely to build; there are many among them who are desirous of shirking their true position, but those who have had experience—or who have, still more fortunately, obtained their experience from others—are becoming aware that the nominal shifting of all responsibility from off the shoulders of the employer on the subject of open questions or undefinable risks, is not a course which will secure for him the execution of the work for a fixed sum, without chance of excess or further trouble; nor does it secure the entire avoidance of questions which may have to be referred.

We are now more in a position to consider the relative advantages of different modes of contracting, and the employment therein of the various professional persons usually engaged, with the extent of devolution of risks accompanying each. Those to which attention is here called are as follows:—(A) Day-work prices for labour and materials. (B) A fixed sum for the whole, obtained from the builder, without the intervention of a surveyor. (C) A fixed sum for the whole, obtained by quantities furnished, priced, or unpriced, by a surveyor. (D) Measure and value on a schedule. The schedule priced by builder on tender. The schedule priced by surveyor, and tendered at a percentage on or off. (E) An agreed percentage on prime cost.

The principal point to which attention is called is the question as to which of the above courses distributes the risks before mentioned most equitably.

(A) *The employment of a contractor who charges by day-work for labour and materials at agreed prices, or at current rates.*

The risks of alteration in price of labour, and, to some extent, in the efficiency of labour, and the risk of alteration in the price of materials, are in this case on the builder, and, if payments are regular, all other risks remain on the employer. There are many cases in which the changes possible in cost of labour and materials are the most important risks, and the only ones which can be taken off the employer's hands. Many large accounts for repairs must be thus treated, and the accounts for works are so treated at times when the employer and builder are equally acquainted with construction, and when the employer is his own clerk of works.

(B) *A fixed sum for the whole, obtained direct from the builder.*

All the risks which I have given as the builder's are supposed to be transferred to him under this arrangement, but the extent of the employer's risks will depend upon the carefulness with which the specification has been drawn, which means a sufficient examination into the various questions by the employer or his architect beforehand. In default of this sufficient examination, the following risks will practically remain on the employer:—

Foundations; adjoining premises; some public requirements, and the difficulty of obtaining special materials, besides others which, if not fully considered, may become the subject of a reference.

The employer's risks which this course is intended to pass on to the builder are—excess in cost, delay in completion, and class of workmanship. The extent to which this is really effected depends again on the specification and sufficient preliminary inquiries—in fact, on the reasonableness of the specification.

Special attention has been called to the necessity of preliminary investigation, because on it depends practically the extent of contingencies which have to be provided for. A builder may insert a sum for all such things as he has not taken the trouble to measure or inquire into, but that is not business, and it is a course which a measuring-surveyor cannot adopt. The object of competition is to avoid the existence of such an item, and to obtain, at lowest market price, a specified combination of recognised marketable materials. Engineers and architects preparing their own quantities may insert a provisional item of 10 per cent. to cover their carelessness; but the result of such an item must be, if disputed, to throw the whole contract open to a careful remeasurement.

(C) *A fixed sum for the whole, obtained from quantities furnished by a measuring-surveyor.*

It is not intended here to discuss the various positions occasionally taken by the measuring-surveyor, and the variations in extent of the authority which consequently attaches to his quantities. Whether he is a builder's clerk, a builder who has relinquished his original business, an architect's clerk, an architect who has relinquished, or is prepared to relinquish, his original business, or a trained assistant to an expert; any of these may be his origin. His appointment may come from some only of the builders, from all the builders, with or without touting, from the architect, from the client. There are risks that he may do injustice to the builder, to the architect, to the client. His fees may be allowed fairly, including or not including responsibility for errors; they may be inserted at a very high rate, and the architect may mulct him in various ways; or the client may cut down his charges till they are insufficient for producing effective quantities. He may prepare them on speculation or with a limited guarantee. In many of the above cases there arises a special risk that his work be not well and fairly done. The conclusion to be drawn is that upon the position in which the measuring-surveyor is placed and the independence of his examination of all risks, intended to be devolved from the employer to the builder, depends the effect of the contract as regards the transfer of those risks.

When the quantities furnished from the information at the disposal of the builder are prepared with sufficient care, such a contract as is now under consideration gives the builder the following risks:—Alteration in price and efficiency of labour; responsibility to complete by a fixed time under a penalty.

The risks connected with adjoining buildings, old materials, use of estate materials, and of special tradesmen's work are reduced to a minimum, but still probably remain on the employer.

The risks as to regularity of payments, as to the idiosyncrasies of the architect and of the clerk of works, are taken by the builder, and the accuracy of the quantities is either taken by the measuring-surveyor or not, according as it has been arranged that he should be paid.

Of those risks which I have termed employers' risks, means are herein taken to reduce those of excess of cost and of delay in completion. The quality of the work depends on the builder selected.

One important element in the effectual transfer of many of the risks enumerated is careful settlement beforehand of what is intended to be done. In some cases this is possible, and for this purpose the adoption of the system of a contract with the assistance of quantities is the proper course.

If it be objected that the careful consideration here pointed out is no business of the surveyor, but is altogether that of the architect, the natural reply is, that in the proper view of the case, this careful consideration, this endeavour to eliminate questionable risks, and to clear up questions which might lead to misunderstanding in the course of the work, and consequent contention, is one of the *raison d'être* of the surveyor's position; that if he maintains this he will maintain the standing of the measuring-surveyor, as a professional man, and if he lets go of this position, and allows, knowingly or carelessly, any question to remain not cleared up which a little care or careful interrogation on his part at the right moment might clear up, then he becomes part of a class whose one-sided and close-sailing evidence has brought much obloquy on the profession.

A class of cases has now to be considered where it is not possible to fix beforehand the extent or nature of the buildings which it is intended to erect.

(D) *Measure and value on a schedule.*

In such cases the ordinary course is to arrange that the work executed shall be measured and valued at an agreed schedule. The changes in the incidence of building risks in this case from the last-mentioned are as follows:—

It is very difficult to fix a time for the completion of the work. The questions of adjoining buildings, old materials, use of estate materials, remain with the employer almost entirely, and, in fact, the risks are much the same as in the case of the employment of a

contractor at day-work prices, except that the efficiency of labour rests more completely on the builder.

The first point which requires attention in the working of a schedule, as contrasted with that of a tender on quantities, is this:—In a tender on quantities a contractor can arrange beforehand for his materials in the cheapest market and at the proper time for the conduct of the building, whereas in the case of a schedule he cannot make this calculation; his tender on a schedule is therefore likely to be higher than on quantities for the same work. There are, however, two ways by which this difference between the systems is occasionally reduced in execution. In the case of a contract it sometimes happens that an architect exercises the power of changing materials in the course of construction, and keeping parts of the building in abeyance to such an extent that a builder cannot take any advantage of the condition of the markets—a point which is against the builder under a contract; and in some cases, where works are executed at a schedule, a fair idea may be obtained at first as to the extent and nature of materials required—a point which is in favour of a builder under a schedule.

The next point of difference to be noticed is that of comparative closeness of measurement.

The accuracy of quantities depends on the time allowed for their preparation, and on the care exhibited in the drawings furnished. The custom of furnishing such details as may be relied upon by the surveyor for preparing really accurate quantities, and by the builder for the execution of the work, only survives in cases so few and exceptional that it may almost be left out of consideration. It is an article of faith that such a custom once existed.

Probably it will be near the mark to state that in very careful quantities, taken from general drawings only, there is an excess of  $\frac{1}{2}$  to 1 per cent. (and there ought not to be more), and that there are various labours taken which a builder tendering will consider either not imperative or included in the general description of the work, to the extent of possibly 1 per cent., but not exceeding that on the whole value of the work. These points are commonly discounted by the successful tenderer. In the case of measurement the excess may be considered as occurring to about the same extent, though it is likely to occur in different items from those which are likely to show excess in quantities: moreover, all labours, and only those which are executed, are paid for. These points are also discounted in the case of tenders on a schedule. The cost of measurement may be taken as 1 per cent. more than the cost of quantities, but the cost of measurement of variations is saved, so there is very little actual difference in this respect to the employer.

There are two modes of pricing a schedule in use:—First. The presentation to the builders tendering of a blank schedule, comprising the principal items likely to be required, and the delivery by each of a priced copy, such competitive schedules requiring very careful comparison by means of a supposititious bill of quantities. Second. The presentation to the builders tendering of a schedule already priced out by a surveyor, and the delivery by each of a tender, at so much per cent. above or below the surveyor's prices, and, as variations of this arrangement, may be added, the use of a published official or trade price-book.

The objection to the first is that a large amount of special trouble is thrown on the builders tendering, who, to some extent, work in the dark, and the prices sent in are likely to vary very much in rate of profit in the several trades, and an endeavour is fostered on the part of the builder or employer to manipulate the work so as for one of them to gain an advantage over the other.

The production of an original suitable schedule, carefully priced out according to the exigencies of any special case by a surveyor, is a very difficult affair, and one seldom carried out. The second case commonly degenerates into the use of a recognised price-book or public schedule, to which objection may generally be taken, that the public schedule is inapplicable to the special circumstances, and is commonly of old date, and that the price-book is based on assumed prime costs, and its application implies a re-examination of all prime costs. In fact, there will generally be much guess-work, and therein an additional cost to those concerned, which, in a cutting business (such as building), will needs end in the employer suffering in some way.

Another point to be considered is that in building works, both contract and schedule, the circumstances of the case often vary so much from those contemplated by both parties at the commencement that in fairness, for more or less of the work executed, the builder is entitled to be paid at different rates from those first contemplated; and these changes involve so much consideration that, on a reference, and occasionally as a mode of avoiding litigation, the actual prime cost to the builder has to be ascertained as a basis for the fair payment for the work. This brings us to

(E) *An agreement to allow the builder a fixed percentage on his prime cost.*

In this case it is recognised that the various risks are on the shoulders of the employer, but, instead of endeavouring to pass off many risks which he cannot control, and making his interest

antagonistic to that of the builder, thus adding another to those he may have to fight in the course of his building operations, the employer faces the risk of an account prepared by the builder, with or without supervision, and trusts to obtaining in exchange the best efforts of the builder in economising time, in which the builder is especially interested, as well as in the economical use of materials and labour.

Such an agreement implies that the employer is one who erects buildings as a business, and that the builder is one who carries out buildings in a known and efficient manner. It implies that there is no intention on either side to best one another. It is therefore usually accompanied by mutual knowledge of the two parties.

In such cases the preliminary questions which always require special consideration and settlement beforehand include superintendence and the use of plant and establishment charges. The terms of agreement usually involve the charging of certain items specifically, and the charge of a percentage made up of two items—one for establishment charges and one for profit.

It need hardly be said that these percentages must vary very much with the class of work required, and with the position and extent of work intended, and also with the position which the builder may hold in the class of tradesmen.

In the above notes it has been endeavoured to treat the subject from a surveyor's point of view. Let it not be supposed that it is wished to underrate the necessity for an architect. The business of the measuring-surveyor is a branch of architecture, not conveniently carried on by the same person who is engaged in designing, and the opinion should be emphasised that one of the greatest risks which an employer ever runs, and one which, if he does run, he may thank himself for, is that of endeavouring to carry out building operations without the assistance of an architect. One principal purpose of the employment of an architect is to see that a result is obtained commensurate with the means employed; but this result is not measured by cubic contents of building alone, but by convenience, suitability, and representative character—all of them other words for true economy. Under general circumstances these requirements can only be obtained by the employment of an architect, who is responsible professionally for the result. He must be treated as an adviser and confidant, not as a servant or contractor.

Some of the difficulties have been mentioned which may be placed in the way of a contractor or of an employer from having an architect of insufficient experience, or of unwillingness to learn; but such faults are to be found both in builders and employers, and dealing with human nature involves risks overcome only by experience and by the habit of acquiring information.

The subject of the selection of an architect, and the position which the surveyor should take if he be employed (and who so fit?) to assist in such selection, is one which, as Sir Walter Scott says in the second chapter of "The Pirate," ought not to be discussed at the conclusion of a chapter.

## ABERDEEN CATHEDRAL.

THE annual meeting of the heritors of the parish of Old Machar was held in the Music Hall Buildings, Aberdeen, on Tuesday. The chief subject under consideration was the proposed further restoration of the cathedral. The former restoration committee, who have a balance in hand of 576*l.*, offered to make the sum over to the heritors, provided they undertook the restoration of the large window in the east end. This work involves the removal of a small, ugly, and incongruous window and an adjoining wall, filling up what had been the chancel arch, and the proposal is to substitute a large window with tracery work, filling the larger part of the span of the arch. Mr. Rowand Anderson, A.R.S.A., architect, Edinburgh, who had been consulted by the Restoration Committee, prepared two alternative plans, one costing 725*l.* and the other 894*l.* The committee recommended the adoption of the cheaper design. The Standing Committee of the heritors resolved not to carry out the work themselves, but offered to contribute 100*l.* to its cost. The Acting Committee in turn declined to undertake an uncertain liability for the cost of the proposed alteration. After considerable discussion, it was in the end unanimously resolved that on the distinct understanding that the Restoration Committee supplement whatever contributions may be required to carry out the alterations and improvements approved of by the Standing Committee, the heritors vote a sum of 200*l.* instead of 100*l.* to the Restoration Committee for the purposes contemplated. The surplus revenue for the year, it was stated, amounted to 39*l.*, which, with the balance in hand at the beginning of the year, 228*l.*, made the total surplus 267*l.*

Messrs. Legrand & Sutcliffe have sunk one of their Abyssinian tube wells at the infirmary which is in course of erection at Benton, near Gravesend. The site being difficult, it was found necessary to drive the well to a depth of 110 feet, when a copious supply was obtained. The work was inexpensive, and occupied in execution only four weeks.

## NOTES AND COMMENTS.

THE new English Dictionary which Dr. MURRAY is editing is founded mainly on materials collected by the Philological Society. It will furnish libraries with a work that can sustain a comparison with the great "Dictionary of the French Language" which was compiled by M. LITTRÉ, or the "Wörterbuch" of the Brothers GRIMM. The editor has obtained assistance from English and American scholars, and he states that he "has been continually obliged to consult specialists on various points—literary, critical, philosophical, phonological, bibliographical, historical, scientific, and technical." But in the list of advisers we are unable to discover a single name that is associated with the history or practice of any one of the fine arts. This omission should be remedied without delay. As we are speaking of dictionaries, it may be mentioned that Messrs. CASSELL have issued the first part of their "Encyclopædic Dictionary"—heretofore published in volumes. It has been carefully prepared, and the definitions, instead of being confined to a few words, become, wherever it is necessary, brief descriptions. The dictionary, which is largely illustrated, is deserving of a place in household libraries.

THE Fine Art Exhibition which was lately held in the ancient town of Dunfermline has been very successful. There were 807 works exhibited, and about 130 found purchasers, which is a large proportion for a small town. Among the paintings sold were *December Morning at Chartres*, by Mr. A. H. HAIG, and *Blickering Hall, Norfolk*, by Mr. R. PHENÉ SPIERS. In addition to the season ticket holders, there were over 7,000 visitors, including many of the working-classes. An Art Union in connection with the exhibition realised 229*l.* 7*s.* by the sale of shilling tickets, and the prize-winners generally added a considerable sum to their prizes in order to secure favourite works.

THE great storm of Saturday last testifies to the soundness of English building. As much as possible has been made of the damage to property, but, after all, it amounts to little more than the fall of a chimney-pot here and there and an occasional slate from private houses, and of a sheet of lead from church roofs. A part of a wall tumbled down in London; but, considering the length of walling in the metropolis, this one instance need not alarm the public. The most serious damage is the reported destruction of a breakwater in the Isle of Man, which cost 70,000*l.*, and was an example of the engineering construction which is so often held up to architects as a model for imitation.

THE gift of 1,200*l.* to the Society of Arts from Mr. W. WESTGARTH, to be awarded as prizes for essays on dwellings for the poor, and on the reconstruction of central London, should inspire a great many architects to enter in the competition. The money has been appropriated in a rather sensible way. The Council propose to give 250*l.* for the best practical essay upon the re-housing of the poorer classes, and especially of the very poorest classes, of the metropolis; 500*l.* for the best practical essay upon the whole subject of the sanitation, street re-alignment, and reconstruction of the central part of London; and three prizes of 150*l.* each for—(1) The best treatment of the engineering considerations; (2) For the best treatment of the agricultural considerations; and (3) for the best treatment of the sanitary considerations. The prizes are sufficiently large to attract thoughtful work, although it is generally said that prize essays are not prized. The essays are to be sent in not later than December 31, 1884. The awards will be made by the Council upon the recommendation of judges to be appointed by them, and will be final. The only defect in the conditions is that which stipulates the printing of essays before sending in.

WE have often remarked on the want of nationality displayed by the Roman Catholic clergy of Ireland in paying every year large sums for foreign vestments and church ornaments, although work that would answer as well could be obtained in Ireland. The Irish schools of art can with difficulty be sustained, for the students feel they can gain no patronage, however well they may design; and yet the value of the Belgian and French work imported into the island

amounts to a very large sum. Mr. BAGWELL, who at one time was an Irish member, has now drawn attention to this subject. The convents should, he says, supply all the vestments which are required. The foreign vestments are not good in style, and the eyes of the peasantry are in consequence made familiar with bad art, and from seeing it in churches believe that it deserves admiration. The ornamentation of secular work appears to be confined to representations of harps, wolf-dogs, round towers, and shamrocks; and few things can be more absurd than the articles in bog oak having those forms, and which are supposed to exemplify Irish art. An exhibition of Irish decorative art is about to be held in Dublin, and, unless the committee of selection are rigid in maintaining a proper standard, many things will be seen which will make the judicious grieve.

THE Education Department have ordered that in two Board schools in Ipswich which have been lately erected the parallel desks are to be replaced by dual desks, five rows deep, in all rooms exceeding 20 feet in width. The plans, it is said, were approved and the loan recommended by the Department on condition that the desks should be dual, and that condition cannot be altered. "If," adds the secretary, "the alteration was made by the architect without the authority of your Board, it is for your Board to see that the unauthorised alteration is remedied." A suggestion of this kind may dangerously affect an architect's career, and Mr. BINYON has protested against it. The dual desks were avoided on account of economy, and if the rooms were made 22 feet wide instead of 20 feet it was also with a view to economy and efficiency. But Mr. BINYON did, it appears, substitute green slates for tiles in one of the schools without informing the Board, and this gives some people an opportunity of alleging that there have been unauthorised deviations from the plans.

A FEW years since there was complaining in this country when it was announced that the Government were unable to purchase the collection of antiquities brought by General DI CESNOLA from New York. It was at once transferred to New York, and there purchased for the Metropolitan Museum, the price paid being 110,000 dols. The General was also appointed director of the Museum. One of his friends is Mr. GASTON L. FEUARDENT, who had charge of the collection when it was in Europe. After a time a breach came between them, and Mr. FEUARDENT announced publicly that the collection was not what it was declared to be by the vendor, and that some of the statues were "a fraudulent patchwork of unrelated parts." The General said that his critic was malicious in his criticism, and in consequence an action for libel is now in progress. The trial is, however, of more than local interest. There is scarcely an antique statue in Europe which has not been restored, and in many cases the extent of the vamping has been concealed, as if it were a State secret. Take, for example, the *Venus of Milo* in the Louvre. It was only when the statue had been exhumed, after Paris was free of Prussians and Communists, that the internal tenons for keeping the parts of the figure together were discovered, and no one could tell how much the parts had been planed in order to bring them together. It is possible that originally the statue had a different pose from that which is now admired. Some of the French archæologists who drew attention to the laboratory secrets in this case, acknowledged that England was the only country where a statue was left in the condition in which it was found.

THE case of CARR v. HENRY RENDER, Limited, has been again tried without any advantage to either side. In 1875 Mr. CARR took a lease of a warehouse, and next year he let one of the floors to the defendants. Another floor was afterwards let. In 1877 a part of the building fell, and the owners brought an action against Mr. CARR for damages. The jury ascribed the fall to overloading of the floors by Mr. CARR's tenants, and in consequence judgment was given against him. He then brought an action against the defendants claiming 10,000*l.* damages; the defence was that the premises were not fit for stores. In a case of this kind, where the building no longer exists, it is very difficult to say whether a floor was originally weak or had been rendered so by neglect and overloading. There were able counsel, but the jury, after some days' hearing, were unable to come to a decision.

## ILLUSTRATIONS.

THE BURKE MEMORIAL, GLASNEVEN.

THE memorial cross illustrated in this week's number will have some special interest as commemorative of a painful historic incident—the murder of Mr. THOMAS HENRY BURKE, Under-Secretary to the Lord-Lieutenant of Ireland, who fell with Lord FREDERICK CAVENDISH on May 6, 1882, in the Phoenix Park, Dublin. The memorial was erected by the resident or stipendiary magistrates of Ireland, with whom Mr. BURKE had for many years an intimate official intercourse. The deceased gentleman was a native of Galway, and from that county the materials for the memorial were chiefly derived. The base, plinth, capitals, &c., are of fine limestone from Ballinasloe, the fluted shaft of the column is of a polished black granite—a beautiful variety derived from the County Down mountains. The cross surmounting the whole is of an extremely hard description of black Galway marble, the form being borrowed from a well-known and beautiful thirteenth-century type—the processional Cross of Cong in the museum of the Royal Irish Academy. The work was designed by Mr. THOMAS DREW, R.H.A., and executed by Mr. SHARP, of Dublin; the carving being by Mr. HENRY EMORY. The whole stands about 25 feet high.

HOLY TRINITY CHURCH, HEREFORD.

THE necessity for further church accommodation at the west end of the city of Hereford has long ago been felt, and efforts have from time to time been made to supply this need, which, however, for want of means have always fallen through, until the beginning of the year 1883, when a committee was formed for the purpose of building a church in the Whitecross district for the benefit of parishioners in the three parishes of All Saints, Holmer, and St. Nicholas. The committee consulted Mr. F. R. KEMPSON, F.R.I.B.A., of Hereford and 7A Whitehall Yard, London, and we publish his design this week. The nave, with north and south aisles and south porch, are now being erected, and the foundations for chancel, tower, organ chamber, and vestry are being put in. The dimensions of the church, when finished, will be as follows:—Nave, 90 feet by 27 feet; aisles, 90 feet by 10 feet 6 inches; chancel, 38 feet by 27 feet; south chancel aisle, 17 feet by 10 feet 6 inches; organ chamber, 20 feet by 12 feet; vestry, 18 feet by 14 feet. The tower will be 25 feet at the base; the height of tower and spire about 180 feet. The church will accommodate between six and seven hundred. The contractors for the portion of the work in hand are Messrs. HUCKSON & WARWICK, of the city of Hereford. The Lord Bishop of the Diocese has fixed Tuesday, the 19th inst., for laying the foundation-stone, and subscriptions are urgently needed to enable the committee to carry out their undertaking.

ALTAR FRONTALS.

THIS set of altar frontals has been designed by Mr. H. ROUMIEU GOUGH, F.R.I.B.A., of Queen Anne's Gate, for the new parish church of Hammersmith, which has recently been consecrated. The church is an unusually large one, and the altar itself is 10 feet long by 3 feet 6 inches high. The designs are somewhat bolder than is customary in embroidered work, in order that they may be effective when seen from a distance. The right of reproducing the designs has been acquired by Messrs. JONES & WILLIS, of Great Russell Street and Birmingham, the well-known church furnishers.

EASTCHEAP BUILDINGS, E.C.

THIS building has been lately erected by Messrs. BYWATER, and is a characteristic example of the class of work which is now in favour in the City. As a lift has been introduced, all the offices are easily accessible by visitors.

ST. MARY'S CHAPEL, ABBROATH.

ARBROATH ABBEY was founded in the year 1178, and completed in a little more than half a century. Its noble ruins indicate a building of great original magnificence. The chapel, of which the illustration is a restored view, is situated in the south aisle to choir. Though roofless and interfered with by a fifteenth-century sacristy of Abbot PANTER'S,

sufficient detail exists to afford material for the restoration here represented. The abbey and abbot's house are well worth careful study, exceptional bits of detail occurring here and there which differentiate the old ruins from others of the same period. Unfortunately the sea air has acted injuriously on the soft red sandstone of which it has been built, but in sheltered nooks the original detail may very easily be traced. The illustration is a reproduction of a drawing by Mr. GEORGE SHAW AITKEN, architect, Dundee.

## THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association was held on Friday evening, the 18th ult., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members:—Messrs. S. Cottingham, A. E. Smith, W. S. Hill, Woodroffe, G. Cole, W. E. Elliman, and C. Beaupré.

Mr. ASTON WEBB then read a paper, of which the following is an abstract:—

## Plasterwork.

It would not be very rash to prophesy that iron and plaster are the two great building materials of the future. It is proved beyond doubt that plaster is one of the most fireproof materials, and iron and wood are better protected by it from fire and heat than by any other. Taking concrete as of the plaster family, floors are largely made of it, and walls also, though with less success. As a sanitary material in hospitals, and such like, nothing is so much approved of for floors, walls, and ceilings. For comfort in rooms there is undoubtedly nothing better than a plaster ceiling; it is draught-excluding, and, to some extent, sound-excluding also. Again, for decoration, more especially in secular buildings, what material more quiet, and at the same time rich and delicate, than plaster? The use of plaster is almost coeval with the art of building itself. But the most glorious time plasterwork has ever known was during the sixteenth and seventeenth centuries in Italy, when a great deal of the most exquisite work was done, together with a great deal that was wrong in principle and design; and in England, during the Elizabethan era, some of the most characteristic and appreciative plasterwork was carried out. Inigo Jones is credited with introducing into England the heavy panelled work of the Italian masters, and immediately plasterwork declined, to be revived again towards the close of the eighteenth century by the brothers Adam, who did much excellent work in their own manner. Little came of it in influencing the art generally. Its traditions were kept alive, however, and Messrs. George Jackson still possess many of the original models. But plasterwork generally became more debased than it had ever been before; and as the real Goths did little for it, so the nineteenth-century Goths did still less—witness, for example, the New Law Courts, where decorative plaster is almost entirely absent. Now a brighter day seems to be dawning for plaster, and, though it cannot yet be said to have got out of its archaeological trammels, it is reverting to a rational treatment; and with a freer style of architecture in vogue, we may even hope it will develop characteristics distinctive of the present time. In designing plasterwork the chief points to be remembered as to its capabilities and qualifications are the following:—Firstly. Plasterwork is essentially decorative, and as an applied material it is unable to bear tension or to support weight: it should, therefore, as a broad principle, not be made to appear as if it did so. Secondly. In order to suggest the material and to avoid an appearance of strength which it does not possess, there should be a general flatness of treatment, and on wall spaces a predominance of horizontal lines. Thirdly. As the material is not suitable for imposing features, and where great dignity and effect are required, they must be sought in the breaking up of the walls by bays and other features, and in the constructional form of the ceiling itself rather than in the enrichment applied to it. Fourthly. All ceiling designs should be studiously quiet and equally covered over their whole surface, and being out of a convenient range of vision, should not have work of the highest interest placed upon them, as it can only be examined at great disadvantage. Fifthly. As all the work at the present day is cast, and therefore capable of almost indefinite repetition, great care should be taken in the design of any enrichment, and none but work of a really high artistic merit admitted. Sixthly. All imitation of stonework or other materials should be carefully avoided.

Plaster, when used externally, has been limited almost entirely in this country to domestic work. In all parts of England where timber building has been carried on, the interstices have been filled with plaster, making good warm walls where carefully executed with proper air spaces. Effect was obtained either by enriching the plaster panels with stamped or carved ornament, more general in the south of England, as at Ipswich; or by obtaining an effect by reversing the process and cutting the wood framing into patterns, more often found in the north, especially Cheshire. These enriched panels are used in modern work; as, for example, in Mr. Shaw's work at the Swan House, Chelsea, and Mr. Holl's

house, and in much of Messrs. Ernest George and Peto's work. They are carved by hand, and is almost the only work now executed in this way which, though it adds to its cost, increases its interest. In stone districts, where the stone or brick was of a porous nature, the upper portions of the walls, or sometimes the whole, were rendered in plaster, and often a light pattern stamped on them with charming effect. Another form of external plasterwork is that known as *sgraffito*. This is composed of two layers of cement, the under coat being tinted a darker colour to choice, and the upper being the usual buff colour. The design is drawn on the surface, and then cut down until the darker layer is reached, thus giving the effect of a good outline drawing. Properly treated it may, undoubtedly, become a very effective decoration, more suitable for external than internal work. It has been, perhaps, somewhat discredited by the result of one or two conspicuous examples which have not been altogether fortunate. The proper treatment of this mode of decoration appears to be in bands used sparingly and not too close to the eye, somewhat in the way in which the Lucca della Robbia ware was often used in Italy: to cover a whole building with it is unrestful, and the ground also should be toned down to accord with the local colour of the building. External decorative plaster should be designed as much as possible in horizontal bands, without any leading vertical lines, which appear to be against the spirit of the material.

One of the points that appear to be of importance in the internal treatment of plaster is, that the treatment of the walls should be horizontal rather than vertical, as immediately they become prominently vertical, they partake of the character of supporting the ceiling, and the material is at least apparently put to a purpose for which it is unsuited. It will be said that sufficient dignity cannot be given to large rooms without some such treatment; but a judicious use of plaster panelling, as at the Ducal Palace, Venice, may attain this, or a high wood panelling, which is also a more suitable material near the floor, and less liable to be injured. The Italians were also very fond of plain vaulted ceilings in plaster, perfectly plain, but elaborately decorated in colour, and these, perhaps, were their most successful ones. The most celebrated of these, though by no means the best, is that of the Sistine Chapel in the Vatican at Rome, said to have been painted under protest by Michael Angelo. To enter this chapel, and see visitors lying on their backs all round the room, attempting, with the aid of opera-glasses, to examine the paintings, must show at once that a ceiling was no place for such work as this. The vaulted library of the Vatican, on the other hand, decorated near the eye with painted arabesque, is altogether a successful treatment. The general impression left on any one after studying the Italian plasterwork must be intense admiration for their wealth of imagination and endless variety and delicacy in their details, but over all a sense of incongruity, as if the true treatment of the material had been missed, and that of stone adopted; so much so is this the case, that from photographs or sketches, it is often impossible to tell or guess whether the material used was marble or plaster. During the time all this magnificence was being executed in Italy, a quieter but truer recognition of plaster and its merits was being given by our own architects during the sixteenth and seventeenth centuries. Admirable specimens of the best interiors of this period have been illustrated in Nash's well-known book. Their characteristics are simple and similar, a flat ceiling cut up with delicate intersecting ribs, hiding no constructional features, nor appearing to do so; all carved enrichment very sparingly used, and the ceiling finished against the wall with a plain cornice, the wall surfaces usually either panelled entirely in wood or three-parts up, and a handsome elaborate frieze above; all plaster being in horizontal bands, and the vertical lines invariably in wood. One of the noticeable elements in design at this time is an absence of effort to connect the design of the ceilings with the walls. They did not seem to feel that this was necessary, as the Italians did, and it relieved them from many difficulties. In the larger ceilings, and where important beams were absolutely necessary, these were often shown as wood. Pendants were employed to mark the intersection of the ribs, by bringing them down some distance below the face of the ceiling, and finishing them with a boss or moulded pendant. This appears to have been with the object of breaking up the flat surface, and affording more relief than the light ribs could do. Great dignity and variety was given to their apartments by deep and lofty bays breaking up the long wall spaces, and by elaborate and massive chimneypieces reaching to the ceiling, the ornament being usually flat and small in scale, with little or no undercutting in the best work. The details of the ribs, cornices, and other features are all worthy of careful study. During this period the mouldings are flat, fine, and in flowing lines, quite unlike those used before in any other material, but admirably adapted to the positions on which they are placed. After the Elizabethan and Jacobean period came another revival, whose traditions have been handed down to our own day, led by Stuart and carried to perfection by the Brothers Adam. The increased study of the work of the ancients had its effect on plasterwork as on other materials, and a flat decorative treatment, very similar to that shown in the Pompeian baths, was employed. Hemispherical vaults were again introduced, and flat plasters divided the wall space. These pilasters hardly, however, could be called constructional. The

enrichment on the ceilings showed great delicacy of treatment, and covered them with a lace-like enrichment which, without the geometrical precision of the earlier sixteenth and seventeenth-century work, still sufficiently covered the surface to prevent any portion being obtrusive. A distinctive feature of this class of work is the way in which the plasterwork spread itself over other portions of a room to which it had not previously been applied, especially the doors and chimneypieces; but beautiful as this latter work is, it is hardly to be commended. Doors and chimneypieces were made of wood, and all the enrichments in plaster stuck on, the whole being painted, so that it was impossible to tell whether it was carved or not. The extreme delicacy and beauty of the design, however, made much atone for the defective principle. There are many examples of the Brothers Adam's works in London, which are very beautiful; but in the present day it is mere copyism, and no designer has yet come forward to carry their work a step forward. French work, though luxurious, extorts our admiration, we feel if it must be wrong in principle from beginning to end. Like some of the Venetian work, it was often used merely as huge frames for pictures; the walls were cut up into panels, and the doors and other features ornamented with endless scrolls. At the present day much is being done which can be admired. Small benefit was derived by plaster from the Gothic revival, and perhaps it is partly owing to the difficulty in using this material internally that has led to the abandonment of that style to so great an extent for domestic purposes. A very wonderful example of modern plasterwork is to be seen at the Grosvenor Hotel. The treatment is very original, and consists, generally speaking, in dividing the walls and ceilings into panels of various sizes and covering the fields with very highly-relieved enrichment of naturalistic foliage. The relief of this foliage is perhaps too great, and the general treatment not flat enough for our idea of what plaster should be; but one cannot but admire the amount of boldness and originality of its design. Our modern Italian buildings show much beautiful plasterwork, and have followed, as a rule, the Italian method, and though often with exquisite detail, added but little either in originality or appropriateness to what had previously been done, and for the most part the mouldings and enrichments could be equally well worked in stone, and, as a fact, are worked in either material. With the introduction of a Domestic architecture—founded, perhaps, on Jacobean, but which may in time to come be recognised as Victorian—more attention is being paid to plasterwork, and in some ceilings by Messrs. Ernest George and Peto (of which specimens were shown), the principle of flatness has been carried out, and its admirable appropriateness to ceiling design. All the requirements of plaster design seem to be met. The dining-room at the South Kensington Museum is a well-known and very good example of modern costly work, with a high wood dado, its walls covered with a freely-treated ornament in low relief and panelled frieze. An admirable ceiling has also lately been added over one of the long galleries, which is a good example of the employment of modern means. Here the ceiling and floor over are carried by iron box girders at intervals across the gallery, and the intermediate spaces have apparently small T irons running both ways, forming squares, say, of 3 feet square; the underside of these irons also show, and the square spaces are filled with slabs of decorated plaster, each of the same design, and the whole is whitened plaster and iron, making a most handsome and sensible ceiling. The iron supports are sufficiently apparent without being obtrusive, and blend well with the ceiling design. Again, at the Natural History Museum, admirable advantage has been taken by Mr. Waterhouse of the Dennett arch, by showing the construction and merely enriching the soffits with ribs. This appears to be a great success, and a distinct advance towards a modern form of ceiling. The iron girders are carried by terra-cotta piers, which really carry the weight, and the girders are encased with plaster, no doubt as a protection from fire, which appears to be a sufficient reason. The plasterwork of the City Liberal Club, by Mr. Grayson, is an example of restrained plaster design, which every one should see who is interested in the subject. A quiet, flat panel treatment has been adopted, with an entire absence of fussy enrichment, which is quite a relief to look on. In ordinary living-rooms it is usual to have a cornice with a cove in it, the whole carrying as many coarse and vulgar enrichments as can be crammed into it, and a huge and overpowering centre flower. The latter should be omitted, on the principle that however the ceiling is enriched it should be equally covered. The cornice should bear some proportion to the size of the room, and may be used to improve its proportions by a somewhat deep frieze on the wall if the room is too high, and if too low it can be heightened by placing most on the ceiling. Little wood ribs on a ceiling are an abomination, unless they are painted in the same tone as the ceiling; the small dark lines wandering over the surface are distracting. It is better to be without enrichment unless a design can be afforded. In a small room a carefully-designed moulding looks equally well, and may be coloured in with the walls with good effect. In larger rooms a high wood dado with diaper plaster above, or low relief ornament, looks well at a moderate cost; but plaster panelling is not convenient for pictures. Where plaster is painted, it should be on flat plain surfaces, as at the Vatican Library,

as the effect of much decoration on relief work has the effect of flattening it. If relief work is coloured, it should be done in broad washes, and, above all, should not be picked out. The Brothers Adam tinted some of their ceilings with light tints on the grounds, to throw up the enrichment, and record that they were much pleased with the result. The greater the richness of a ceiling in relief the less colour there should be, and with some ceilings nothing looks better than a light cream colour, not distempered, but either left the natural tint of the material, painted, or wax-polished. This hardly applies to such ceilings as the picture-frame ones of the Doge's Palace at Venice, or the modern French work, which will take any amount of gilding and colouring, and produce a most gorgeous effect. The greatest change in the execution of plasterwork has been made comparatively recently by the introduction of cast work. Up to the time of George II. all enriched work was modelled by hand; since that time, with the exception of some external work, the whole has been cast. All enrichments are cast and cleaned off by hand, and in very high-class work by the artist himself, who is thereby enabled to put some individuality into it. Messrs. Jackson employ four varieties of moulds—a plaster mould, gelatine mould, wax mould, and brass mould. The plaster mould is used where the work is much undercut, such as in a Corinthian cap where the mould is quite an elaborate contrivance of many pieces, and it may be assumed that where a mould of this sort is found necessary there is a departure from plaster treatment. The gelatine mould is that most used, as, owing to its having a little "give" in it, the plaster cast can be drawn from it even if slightly undercut, and it is also sufficiently firm to enable the plaster to be pressed well into it, and so to secure a sharp casting. A wax mould is very similar, but will not stand so many castings being taken from it. A brass mould is usually used for small running enrichments where great sharpness and a large number of castings are required. All these moulds, except the brass, are soon a little worn, and a good plasterer will only take a limited number of castings from the same mould. The continuous casting from the same mould is the cause of much of the miserable stuff we generally see. Plasterers appear to agree that the best effect is obtained by casting. The fibrous plaster introduced by Messrs. George Jackson consists of two coats of plaster, with a layer of thin canvas between. By this method an enriched ceiling or cornice is cast in slabs; the cornice, enrichments and all, are cast in long lengths, and the whole screwed up to the joists without lathing or rendering of any sort. What is roughly called plasterwork for internal use is comprised of three materials—very fine plaster, papier-maché, and composition. The papier-maché is, as its name implies, made principally of paper, and is used especially for French work and work of that character; while the composition, which is made up largely of glue, is used for fine "planted on" enrichments, such as in the Adam's work.

A vote of thanks was, on the motion of Mr. Stannus, seconded by Mr. V. Trubshaw, and supported by Mr. H. D. Appleton (hon. secretary), Mr. H. W. Pratt, and Mr. Cole, unanimously passed to Mr. Webb for his paper, and the proceedings terminated.

### PATENT LAW.\*

THE new Patent Law will not only remove some of those financial impediments to invention which in many cases made it impossible for a man to secure a patent, but it will also dispel the mystery that was supposed to envelop the procedure of Southampton Buildings, and which no one but a regularly-ordained agent could understand. There was a time when an inventor appeared to be surrounded by forms that were in all respects, save their unlimited capacity for securing fees, as fabulous as hydras and chimeras. That condition of things was gradually amended, and now and henceforth a man can know with whom he has to deal; and if he pays fees, he has the satisfaction of feeling that no part of them enriches a "deputy chaffwax" in virtue of his sinecure. One effect of the transformation will be a change in the relation between inventors and agents. Under the new regulations it would be possible for a patent to be taken out without the aid of an agent, although this might not always be a prudent course. But when an agent is employed his office is reduced to a minimum, and in the preliminary stages the inventor can be master of the position. It becomes, therefore, the duty of inventors for their own sakes to understand a system which closely concerns them. The regulations have been framed so as to be comprehended with as little difficulty as is possible, and, if they are unknown, the inventor must suffer. According to the old maxim, "Ignorance of the law excuseth no man," and it is especially applicable to inventors who will not take the trouble of understanding what is required of them under the new Act. The "Digest of Patent Law and Cases," which has been prepared by Mr. H. A. A. Gridley, is a guide which will enable any intelligent man to realise what has to be done in order

to obtain a patent; and it points out the risks which must be obviated if the patent is to be secure. The author evidently believes that a writer should never attempt to treat of a subject until he has read himself full upon it, and in this little book we have the pith of many ponderous treatises and reports. It is an example of what can be done in a small space when an author possesses skill in arrangement, analysis, and exposition.

Mr. Gridley has taken care that his readers should understand at the outset the difference between the old and new regulations, and inasmuch as the principle of the law of patents remains as before, he gives decisions of the courts in the judges' own words, which will interpret the meaning of the clauses in the Act of 1883. The first chapter explains who is to be considered "the true and first inventor," and it is seen that the title may be claimed by four classes of persons, viz., any one who first suggests the practical principle of an invention, or who first imports an invention from abroad not previously known here, or who is the first to take out a patent where two or more invent the same thing independently at the same time; or, lastly, any one who renders practically useful an invention not previously known as part of the common knowledge of the State, or not previously practicable.

Something is said about each of these classes, and the reader is made aware of how they are established by judgments as well as by clauses in the new Act. Next, what is an invention is considered, and it is explained to be (1) a new invention, that is, the embodiment of an idea or a principle in some practical mode; (2) a combination of known subjects or existing inventions producing a new, better, or cheaper article than produced before; (3) a new process in producing a known article; (4) a new application of a known subject or invention to a new subject not analogous to the old application. It is needless to say that a great many inventions have been declared to fail in one or other of the foregoing characteristics, and in consequence the patents have not been upheld. Thus, for example, under the third head we find a reference in Mr. Gridley's book to the action taken by the Pennycook Patent Glazing Company. The plaintiffs' process is rightly described as a combination of sheet metal heated in a particular way with ductile metal for fixing glass for roof lights. But "the use of sheet metal in the construction of an astragal was not new, nor the use of ductile metal for fixing glass in windows. In the defendant's process the astragal was of iron, and had no clips. It was held that the defendant's process was no infringement of the plaintiffs', and both were good." In cases of this kind a knowledge of what is demanded would often save a patent, for provision might be made to avoid the use of things likely to be considered not new in the Courts. But, unless the inventor will exercise his foresight, he must expect that rival claims will be set up to his disadvantage.

The remaining part of Mr. Gridley's book is devoted to a description of the proceedings under the new Act, and throughout suggestions are given which will be invaluable to inventors. In preparing the specification and drawings it will be necessary to take if anything more care than formerly, and the cases quoted by Mr. Gridley will often serve as a warning. Thus in one we find an invention was set aside because a circular hole through which flame was to pass had been omitted from the drawing. Another patent was held to be bad because the inventor stated that he intended to make rollers of iron coated with china—not specifying what kind of china. In a third case the patent was declared void because the word "iron," which was in the provisional specification, was omitted from the complete specification. In fact, Mr. Gridley's book is interesting if it were only to show how difficult it is for any statement to sustain the microscopic examination of its words and phrases, which is inevitable whenever a patent case is brought before the Law Courts. One of the most important chapters is that relating to infringement, and all possible attempts are brought under a certain number of heads. Everything has been done to bring legal knowledge in a systematised manner before the reader; and, owing to its scientific arrangement, there is a wide difference between Mr. Gridley's book and the popular but misleading manuals which are sometimes compiled for the guidance of the public in legal matters. The "Digest of Patent Law" is exactly what it professes to be, and we have much pleasure in recommending every inventor to obtain a copy.

### BRITISH ACADEMY, ROME.

AT the annual general meeting of the British Academy of Fine Arts in Rome, Mr. Poingdestre, vice-president, in the chair, the members of the out-going committee were re-elected, after a vote of thanks for their zealous attention to the Academy's interests during the past year. The statement of the accounts showed a clear balance in hand of 1,158 frs., being a slight increase over that of last year. The Academy continues, as usual, open in each season from the beginning of November to the end of March, for study from casts during the day-time and from the living model in the evenings, when the library is also open to the members. The donations during the year towards increasing the funded property of this centre for English art students in Rome (which was founded by Gibson and Eastlake when themselves little more than students) amounted to a very trifling sum.

\* *A Digest of Patent Law and Cases, incorporating the Provisions of the Patents for Inventions Act, 1883, for the Use of Inventors and the Legal Profession.* By H. A. A. Gridley, M.A., Barrister-at-Law, Marcus Ward & Co.

## THE GLASGOW SCHOOL OF ART.

ON Tuesday Mr. Robert Greenlees, the late head-master of the Glasgow School of Art, was entertained at dinner by some of his former pupils, and presented with his portrait, which had been painted by Mr. William McTaggart, R.S.A. Mr. James Sellars, architect, presided.

The Chairman said that for the past thirty years Mr. Greenlees's name had been identified with art teaching in Glasgow, and he had been known as one of the best figure and landscape painters in Scotland. To no other man was Glasgow so much indebted for the position it had reached artistically as it was to Mr. Greenlees, as a very large majority of the artists who formed the school were indebted to him for their earliest artistic training. The good results of his teaching had been also felt over a much wider field by architects and designers of all kinds of artistic work. It would be difficult to estimate the amount of good work which Mr. Greenlees had accomplished in the thirty years of his life which he had devoted to art teaching.

Mr. Greenlees said he felt deeply and sincerely the high honour which had been paid to him, and he would ever look to the work of art with which he had been presented with the greatest of pleasure, and always prize it highly. During the many years he was connected with the School of Art it was ever his endeavour to look to the interests of the students. He tried to direct many of them in the way they wanted to go, while he directed others in the way that they did not want to go. It was not every one who could obtain a good position in art. Still, while many students had obtained good positions as artists, many more had obtained good positions as art workmen. He had received letters from old students, now in various parts of the world—especially America—in which they had thanked him for the way in which he had directed them in their studies. After giving a sketch of the amount of work accomplished by the Glasgow School of Art since he undertook its management in 1863, Mr. Greenlees went on to say he could remember the time when there was no School of Art in Glasgow and very few artists. He remembered when the Brothers Mossman, himself, and several others opened a School of Art on their own account, and a very humble school it was. As far as he could recollect, it was at least up five stairs in a little room in Nelson Street, adjoining the old Post Office, and they even undertook to white-wash and sweep it out themselves. They got a few casts, and worked away with a candle stuck in each drawing-board, the school going on for a couple of years, after which they got the use of the collection of casts belonging to the Dilletante Society, and continued the classes in the Andersonian University. It was in 1843 or 1844 that the Glasgow School of Art was opened, and he did not require to tell them of the success that had attended it, or the position which it now occupied in Glasgow compared with what it did in its early days. When the school was opened there would be about a dozen young lads in the city wishing to become artists. They were now legion. It would be a very strange thing indeed if out of that number they could not establish a school in Glasgow quite worthy of the name of their great city.

## PAINTED GLASS IN GLOUCESTER CATHEDRAL.\*

IT is much to be regretted that in the histories of the religious establishments of the Middle Ages little or nothing is recorded of what must have been among their chiefest ornaments—their coloured and storied windows. Those windows, by the subjects they portrayed, by their inscriptions, their symbols, and their heraldry, contributed much to history; but, with rare exception, the history of the windows themselves is a hiatus in archæology.

Such is, lamentably, the case with the windows of the old Abbey of Gloucester, about which the early history compiled by its first mitred abbot, Frocester, gives account of other arts, and enumerates the detail of comparatively trivial works in them, but entirely omits all mention of the windows. His history closes at the end of the fourteenth century. The choir of his abbey must have been radiant throughout with coloured and figured glass of the finest kind. His abbey was so rich as to command the best of everything. After his time great buildings were erected and filled with glass, both English and foreign, but not a syllable of its history remains.

There is no art or branch of industry in this country about which so little is recorded as that of the making and use of glass. Until we approach the fifteenth century all that is known is gathered from incidental notices of local history. Many vessels of Roman glass have been found, and, in still greater abundance, in Anglo-Saxon tombs; and these last, by certain peculiarities of form and quality, are regarded as of English production. The remains of a Roman glass-house still exist at Buckhold, in Wilt-

shire, a Roman station; but the first authentic account of glass-making in England is in the well-known story of the invitation from the Bishop of York and the Abbot of Wearmouth, at the latter end of the seventh century, and from the Abbot of Jarrow, in the middle of the eighth century, to glass-makers in France to come over and establish their industry in those places. In many parts of England we hear of "glaziers," a term which embraced both dealers in and painters of glass; and as it is entirely unnoticed who their glass was produced by, or where they got it, it is not unfair to surmise that that term embraced also, at least in many cases, the makers of the glass. Of glass painting we know that it was first and for centuries employed for religious establishments. As in the case of all other fine arts, its first home and cultivation must have been within the quiet retreats of the monasteries of gradually christianising Europe, where all the traditions and technicalities of the arts were centred, coming westward from Constantinople and northward from Rome. The earliest account existing of the method of painting glass is the MS. of the Monk Theophilus of the eleventh century. In succeeding centuries we are still left in ignorance about the makers of glass. As it came more generally into use, it was probably made by private persons, and on too small a scale to be classed with the industries peculiar to any place. It seems probable that those Mediæval glass makers were associated with iron smelters, for, in a rough way, they required much the same materials and appliances for their work in iron, lead, and glass; and of this we have indications in Gloucester, especially in and about Long Smith Street, famous in old days for its iron forges, where it is still common, in making deep excavations, to come upon vitreous slag, like the refuse of glass furnaces, in common with cinders and the refuse of iron-work. And further, among the old trade companies of Gloucester, one is described as that of smiths and hammermen, ironmongers, cutlers (saddlers), and glaziers. It is difficult to believe that an industrial art, so early established in the North of England as the seventh and eighth centuries, and of great and growing demand through the Middle Ages, could have died out; or that the numerous and wealthy religious establishments could have risked the supply of glass from anywhere than at home. Still, we have no certain records of its production; and it is not till the time of Charles I. that the first glass-house is recorded to have been built in England, and that was in the Forest of Dean, at Lydney. The foundation of it still marks the spot. The reference to glass as a special industry in Gloucester; and the name of "Glasshouse Yard" as a site in this city, and the glass-houses shown in the earliest engraved view by Buck in 1734, or the bird's-eye plan of the city in Atkyn's History, 1712, were all subsequent to that date.

I regret that the limited time allowed for this paper prevents me from telling you all that is known of the art and the artists of glass painting through the Middle Ages in England; but sufficient is known to conclude that both the glass and the painters employed were English and foreign, as was the case with the architects, and members of the religious communities themselves, paying and receiving visits from the foreign members of their Order. But for the dates and schools of most of the works of Gothic times, we must trust to our own knowledge of styles and technicalities to form any opinion. In our own cathedral there are some noble relics; and the scraps that still remain in every corner of it, and even in the cloisters, testify to the universal prevalence of this art throughout these buildings. I feel bound to mention here, with great respect, the good service rendered to this art by Mr. Waller, the architect, in rescuing numerous relics of old glass, every scrap of which has been subsequently worked up into the windows by modern glass painters, invariably in the same places to which those pieces belonged—*i.e.*, where those places were known—in many parts of the cathedral, but pre-eminently in the third and fifth windows in the north wall of the north aisle of the nave, which are fully half of ancient glass. The two most important relics we possess are the east windows of the choir and Lady Chapel. The smaller remnants in the heads and tracery of the windows are too numerous to mention here. The great east window of the choir is the earliest of them. The choir was enlarged and lined with a web of Gothic tracery by Adam de Stanton, abbot from 1337 to 1351; but probably completed by his art-loving successor, Horton, the contributor of numerous beautiful and costly things to the Treasury. The stonework of the east window must have progressed upward with the rest of that work, as every line of that net-work is consummated in the groined roof. It is all one; there could have been no break in it. The character of the glass in that great window accords with that date. Mr. Winston, certainly the first authority on the subject, assigns from 1347 to 1350 as the date of it. The information gained from its heraldry confirms the date, and the character of the figures and quality of the glass authorise the opinion that it is all of English work. But of this window I need say no more, for Mr. Winston has entirely exhausted the subject in a paper written for the Archæological Institute. In general effect it is magnificent, but in detail it is a wreck. Happily the general contours of the figures have been preserved, but their limbs and draperies are in many cases a mere medley of heterogeneous scraps, collected from the ruin of the figures in the clerestory, and with its outer

\* A paper by Mr. Gambier Parry, read at a meeting of the Gloucester Cathedral Society, and printed in the *Gloucester Chronicle*.

panel filled with a little figure rescued from the wreck of the Lady Chapel. The preservation of this window through the troublous times of the siege of Gloucester is probably rightly assigned to the care of Governor Massie and Alderman Pury the younger, an influential Parliamentarian, a man of literature and cultivated tastes, who, with his friend, Sir Matthew Hale, established the library in this chapter-house. Painful as the story of destruction would be, the loss of it is deplorable. The saddest parts of history are often those of its keenest interest. There was but one other window of which the ancient glass remained complete to modern times, and of that not one scrap remains. The subject of that window was the *Blessed Trinity*. It had escaped the ravages of time and revolutions, but it so scandalised Canon, afterwards Bishop, Fowler that he obtained an order from the Chapter for its removal; and in the account he has given of his proceedings, which have a touch of the comic about them, in this grave dignitary scrambling up ladders and on hands and knees over the roof of the nave to reach the object of his animosity, he states plainly that he smashed it with his own hands, June 23, A.D. 1679.

There was a burst of enthusiasm in religious art in the fourteenth century; and a good illustration of it is given in the notice of Abbot Wygmore's life in Frocester's "Chronicle." John Wygmore was abbot from 1329 to 1337. He immediately preceded the abbots under whom the east window was erected and glazed. There must have been great artistic activity among the inmates of the abbey in his time; and the school of art he had formed, and the company of workmen he had about him, quite account for the works so marvellously completed in architecture and glass painting during the abbacy of his successors. Abbot Wygmore is described as "well skilled in mechanics and other arts, in which he very often worked himself; and he had also other artificers, excelling in various arts, and in mechanical works and in embroidery." That is to say, he was a practical architect, the head and chief among arts. Under his auspices, or more probably by him, the Perpendicular style was invented, Edward the Second's monument was designed and completed, the south transept finished, the choir screen, several chapels, and other works were built and adorned. He was, in short, an artist all over; and as glass painting was then, after architecture, the most extensive of all the arts employed in Mediæval churches, it is inevitable to infer that glass painters were members of that company which Abbot Frocester describes as "artificers excelling in various arts." I venture to attribute the execution, if not the design also, of the figure of Edward the Second to an Italian in that company. Two large paintings are recorded to have been executed in his time, for the abbot's chapel and the high altar, and it is well known that painters of such works, and the artists who polychromed the roofs and screens of churches and figure-painted the walls in distemper all over the country, were the same as those who made the designs for the so-called "glaziers" who painted them upon the glass. These men commonly travelled about in companies, as the masons did. Illuminators of MSS. and caligraphists were also roving geniuses; but as it is hardly necessary to add, arts were equally practised by the inmates of the religious houses—as by such men as Prior Goldstone, architect at Canterbury; Allen de Walsingham, who was just such another at Ely as Wygmore was at Gloucester; and William of Wykeham, Bishop of Winchester, and other such in England at this period. Much painted glass was imported from Germany and France during the fourteenth century; but this was not the case from inability of such companies of artists and artificers as the priors and abbots all over England had collected around them, but because of the craze for glass painting which existed in England at that time, and made the demand too great for the home supply.

Of all the buildings of this great abbey the Lady Chapel must have been the gem of greatest beauty, worthy of the motto employed elsewhere, "*Ut rosa flos florum sic domus ista domorum*"; with its walls and windows rich with sculpture and colours, and its altar reredos more beautiful than all. The glass in this Lady Chapel is of a character altogether different from that of the choir. The stonework of the windows consists of a repetition of similar panels, common to the architecture of the fifteenth and following century. Most of the windows still retain in the heads of those panels the upper parts of canopies in painted glass, which suggest their treatment to have been of single figures of saints, martyrs, and leading characters of church and sacred history. These have been all destroyed. Some idea may be formed of the injuries this cathedral has received within a short time ago, when I mention that I have learnt from a man still living that he remembered as a boy to have seen the floor of the eastern part of this lovely chapel strewn with glass and stones, and that I also learnt many years ago from a man, now no more, that the boys of the College School used to amuse themselves by smashing with stones the glass of the northern windows which bounded their playground. Another anecdote, though of a different character, affecting the loss of old glass, has been afforded to me from the acts of the Chapter, in which it is stated: "Whereas a quantity of painted glass has been lately stolen from the east window of the cathedral; ordered that a reward of fifty guineas be offered for the discovery and conviction of the offenders. June 1798." The east window of the Lady

Chapel is still very interesting, although glazed throughout with the mere relics of ruin. By careful study it is possible to picture to one's mind what it may have been. As we now see it, it is a rich kaleidoscope of heterogeneous pieces, scarcely a scrap of which remains in its original place except the glass in the three-foil heads of the panels. The character of these many pieces is so distinct that it is easy to sort those which originally belonged to this window from others in the choir and elsewhere. The stone framework of the east window consists of three rows of panels in the body of the window, and a few of various sizes in the head. If we take the uppermost row by way of illustration, we shall see that the glass in the heads of those panels clearly indicates the character of the subjects beneath them, and indeed the scheme of the entire window, namely, an alternation of open-air subjects, and single figures; the former being clearly shown by the blue sky with tops of towers rising against it, and the upper parts of the spears and standards and processional crosses carried by the figures in the subjects of the panels below. Many of the subjects are also shown by pieces of glass scattered about the window, such as the body of our Lord with hands bound in front, either for the subject of the *Ecce Homo* or the flagellation; another is the figure of Christ with His right hand opening His dress and showing the spear wound in His side. There are many beautiful female heads, tenderly drawn and full of expression; a fine figure of a bishop, and a group of heads of monks, forming the crowded background of some subject. Scarcely one, if any, of these are in their original positions. One of special interest is what I suppose to have been the principal figure in the window, namely, that of the Blessed Virgin in Glory. This figure is on the extreme right of the middle row of panels. The glass is broken, and filled in with mixed fragments of all sorts; but the outline of the figure is easily traced, especially by the remains of the golden aureole of rays which originally surrounded the entire figure even to below its feet. This figure does not belong to the panel which its remains now occupy; it is too tall for it; and the old glass still remaining in the three-foil head of the panel has nothing to do with it, consisting, as it does, of an open blue sky, with the tops of towers and spears rising against it. No panel in the window, except one, could conveniently hold that figure, with its golden aureole complete, and that is the long central panel in the head of the window—a place which the glorified figure of the Blessed Virgin might be expected to have occupied in this principal window of her chapel. The glass of this window was foreign. The painting is very refined, and, from the great expression conveyed by the figures, it must have been the work of real artists. If we remember the principal schools of this art on the neighbouring continent, from which much glass was at that date imported, I think that, taking the prevalent style of French art in glass at Rouen or Rheims, we might incline to attribute it to that origin; but the details of all the accessories are more of the advanced Flemish than the French school. Neither should we trace it to the Nuremberg and North German school, where the Albert Dürer type prevailed; but whether we look at the detail of ornament, the draperies, or the architectural accessories, I think we should be right in tracing that window to Flanders, and the school of Ghent or Bruges; and from one or other of those towns I believe it to have come.

These two east windows, ruins though they be, are in their way invaluable, and, like the lesser remains elsewhere, should not be touched. But the subject that is forced on our attention is as to what should be done with those that ruin has left empty. I can, shortly, only answer that question thus:—Every kind and style of art has a genius special to itself; and as each is the embodiment of the prevailing sentiment or talent of its time, the effect, wherever works of contemporaneous art are combined, is harmonious and beautiful, from the unity of spirit which pervades them. It does not require artistic knowledge, but it *does* require a refined sense, to perceive this. I believe it to be true that a congeniality of spirit does exist in all those fine arts which have sprung up side by side, and that a sympathy of relationship between them is the cause of an indescribable charm and beauty which the introduction of any foreign form or element would mar. It follows, therefore, that if glass, perfect in congenial style and work, could be found for these empty frames of Mediæval stonework, the result would be more satisfactory than if they were filled with designs in the style of Michael Angelo, Hogarth, Sir Joshua Reynolds, or a modern portrait painter. The whole question turns on the propriety or otherwise of reviving a style of former days; and to this I think that literary criticism has not been always just in a sweeping condemnation of it as mere servile mimicry. Alas! it may be, and in some cases it has been so; but it is by no means necessarily so. It is quite possible, and indeed not uncommon, for an artist to be so touched by the specialities of some particular style, and his sympathies so engaged by the harmony of its various arts, as to become thoroughly imbued with its spirit, and to make it all his own. If the literary critic could feel how irresistible the impulse of artistic genius could be, he would throw up his trade and take to the pencil or the palette, and learn by experience the sacredness of art and the tenderness of an artist's sympathies; and then he would possibly allow that an artist may make any style his own, according to the bent or purpose of his mind; and dismissing of

course all idea of weak composition or bad drawing, which were merely the misfortunes of early and ill-instructed times, such a man could work without reference to anything but his own spontaneous impulse, without cramp or hindrance; free as air and happy in the style of his adoption, whether sacred or secular, Classical, Mediæval, or modern, and he would translate into that the poetry of his soul.

### THE EARTHQUAKE AT CASAMICCIOLA.

THE committee appointed by the Minister of Public Works in Italy to consider the best mode of rebuilding the houses destroyed by the recent earthquake has sent in its report, to which is appended a complete return of the number of deaths and of houses destroyed. Out of the 4,300 inhabitants of Casamicciola itself, 1,784 were killed and 443 injured; while of the 672 houses, 537 were completely and 134 partially destroyed. Of the 1,800 inhabitants of Lacco Ameno, 146 were killed and 93 injured; and of the 389 houses, 269 were completely and 102 partially destroyed. Of the 6,800 inhabitants of Forio, 146 were killed and 98 injured; and of the 2,713 rooms (no separate return is made of houses), 1,344 were completely and 977 partially destroyed. Of the 2,000 inhabitants of Serrara, 28 were killed and 21 injured; and of the 1,159 rooms, 65 were completely and 973 partially destroyed. Of the 4,600 inhabitants of Barano, 10 were killed and as many more injured; and of the 2,693 rooms, 63 were completely and 1,430 partially destroyed. No loss of life occurred at Ischia itself; and altogether the earthquake occasioned 2,313 deaths, while 762 persons were injured. Of the 2,313 killed, 650 did not belong to the island, but of these only 54 were of foreign nationality.

### GLASGOW INSTITUTE OF ARCHITECTS.

A MEETING of the Glasgow Institute of Architects was held on January 23 for the purpose of considering the draft of a proposed Burgh Buildings Act. Mr. James Thomson, F.R.I.B.A., president of the Institute, was in the chair.

Mr. William Maclean, hon. secretary, read the correspondence with the Lord Advocate as to the proposed Building Act, in which his Lordship stated that he would be glad to receive a proof of the draft Act, and thereafter to receive a deputation from the Institute on the subject.

The President said they would doubtless remember that a deputation from the Glasgow Institute, consisting of Mr. John Honeyman, Mr. Campbell Douglas, and himself, waited on the Lord Advocate in London on June 29 last, to impress on his Lordship the Institute's views on the desirability of having a Building Act apart from the proposed Police Bill for Scotland. He having expressed a wish to have some of these proposed details more fully before him in writing, the draft Act now to be considered had been prepared by the council. Some months ago he convened a committee appointed by the council to consider the subject. Afterwards several meetings were held, and the matter was fully discussed. He thus procured some very valuable suggestions, which were embodied in the Bill now to be considered. He was glad to say that it had been endorsed unanimously by the council, and he hoped it would be adopted by the Institute with the same unanimity, especially as they were all cognisant of the cogent reasons that had been advanced first and last by the Institute for the reform being of the radical nature proposed, instead of trying to patch up and improve the present Acts. He was decidedly of opinion that the members of their profession were the proper parties for the framing of such an Act, and the Institute had taken up the matter solely *pro bono publico*, and it had done so alone, without alliance or understanding with other bodies interested in lands and buildings. They were alive to the fact that some gentlemen who had had great experience, as for instance Mr. Honeyman, went even further than this, and advocated that all the Building Acts throughout the country should be swept away, and that the Legislature should provide an Act applicable to all buildings throughout the United Kingdom. Undoubtedly this reform would be a desirable one, and in many respects a considerable boon to the public; but he was doubtful if the time had arrived yet when town councils and corporations were prepared to surrender their legislative powers to Imperial Parliament. They would for the present receive with thankfulness such an Act as the one proposed by the Institute, as it would very materially tend to remedy the evils they had over and over again alluded to. There were a few points in the Bill to which he would call special attention. In section 16 important regulations as to projections were suggested. In section 29 it was proposed to furnish to the Court a ground or block plan only. Section 33 contained provisions for the prevention of over-crowding. At present there were many more dwellings on each stair-landing allowed than the Institute aimed at having under this section. Sub-section 19 related to factory stairs, and was one that was a step in the

right direction, giving protection and means of escape to the workers in such buildings in case of fire.

On the motion of the President, seconded by Mr. Sellars, it was unanimously agreed to adopt the draft print of the proposed Building Act submitted to the Institute, and the secretary was instructed to forward a copy of it to the Lord Advocate.

On the motion of Mr. Sellars, seconded by Mr. W. F. McGibbon, the following were appointed as a deputation from the Institute to wait upon the Lord Advocate to give his Lordship any explanation he may desire, namely:—Messrs. James Thomson, president; Campbell Douglas and John Honeyman, past-presidents.

On the motion of Mr. David Thomson, seconded by Mr. Bromhead, a committee, consisting of the whole council and the past-presidents and vice-presidents, was appointed to take charge of the architectural examinations, to be held in Glasgow next month, of candidates desirous of qualifying for the associateship of the Royal Institute of British Architects—Mr. Campbell Douglas to be convener and Mr. T. L. Watson sub-convener.

On the motion of Mr. David Thomson, seconded by Mr. Landless, a vote of thanks was awarded to the President for the great time and attention he had bestowed in connection with the preparation of the draft Building Act.

### THE DECLINE OF ENGRAVING.

A LETTER from "A Line Engraver" has appeared commenting on the communication from the Fine Art Society. The writer says:—"No plant will flourish without nourishment. The large prints of the present day to a certain extent overshadow the smaller works of the end of the last and the beginning of the present centuries, which were the nursery and school of English line engraving. All the great line engravers from the time of Sharp and Woollett commenced their careers by working for the 'booksellers'—to wit, Cooke, Harrison, Bell, Bowyer, Boydell, Cadell, Suttaby, Longmans, &c., also G. Virtue & Fisher & Sons, and from the ability displayed in these productions, after Dodd, Thurston, Bunbury, Stothard, and Smirke, emerged such men as James Heath, Raimbach, Golding, Parker, W. Bromley, Anker Smith, J. H. Robinson, W. Finden, and, in landscape, G. and W. B. Cooke, Milton, Goodall, Middiman, Pye, W. R. Smith, J. T. Willmore, J. Cousen, and others. Now this class of work is nearly extinct; a book with high-class plates is very rare indeed! Thus the only employment for line engravers came from the book trade or private firms. The Government and schools have done nothing for engraving or engravers. George III. and his family were all great patrons of engraving. But let us turn our eyes to the Continent, and we find all the Governments deeply interested in the art of engraving, and liberally encouraging it—for instance, Paris, Vienna, Munich, Rome, St. Petersburg, and even the United States—and rewarding the skill of the engravers by medals of gold or silver, diplomas, &c. I do not understand, on the face of facts, how the Fine Art Society can recommend a youth to enter upon the pursuit of line engraving. The writer can have no idea of the intense application necessary to acquire the facility and knowledge of the use of the tools. As to the Copyright Act, I have always found it a stumbling-block. Large sums are demanded by artists for copyright in addition to the purchase of the picture, if the owner will not lend it, though I have always found owners very liberally inclined, 'but for the copyright,' towards engravers; therefore no engraver would venture to engrave and publish a plate on his own account, as, in a pecuniary point of view, he would only lose his time and money. So the engraver is obliged to work for the publisher, and, like the barrister, take what he can get and the best price for his labour. The engraver also is terribly at the mercy of the critic, who generally is unacquainted with the technical beauties of his work."

### THE INTERNATIONAL HEALTH EXHIBITION.

A MEMORANDUM prepared by the sub-committee on the Construction and Fittings of the Dwelling-house, has just been issued. The committee think it should be distinctly understood, with regard to all the classes in which are to be shown buildings, furniture, fittings, &c., that only such exhibits as have a distinct bearing upon health can be admitted. Specimens, therefore, illustrating building construction generally, the decoration of houses, or their furniture, cannot be admitted unless they are shown to have actual reference to the health of the inmates of the houses. It is desired to show not only models and designs for sanitary houses, but also, so far as possible, specimens showing their construction. It is desirable that those exhibitors who are prepared to erect specimens of actual buildings should, as far as possible, co-operate with other exhibitors who may be desirous of showing fittings or furniture for such buildings. The Executive will, as far as possible, facilitate such arrangements, but it will be well that the exhibitors should agree between themselves as to the manner in which such collective exhibits may be arranged. Under the

proper class may be included, in order to draw attention to existing defects, specimens of insanitary decoration, such as arsenical wall-papers, hangings, &c., so that the public may be taught what to avoid. Special interest would attach to any evidence of equally good effects being obtained by the use of harmless materials, and in many cases it may be desirable to show side by side, for purposes of comparison, papers, fabrics, &c., treated with poisonous colouring matters, and also with colouring matter of a harmless character. One of the classes includes all appliances for personal cleanliness, public and private baths, &c. It is hoped that a full display of these may be forthcoming. The Executive Council have had under consideration the question of fitting-up baths for actual use in the Exhibition, as was done in the Berlin Exhibition, but it has been decided that it would be sufficient to show baths completely fitted, without putting them into action.

The sub-committee on water supply and sanitation have prepared a memorandum on the exhibits which are sought for classes 21, 22, 23, and 27 of group 3, "The Dwelling." With a view to bringing before the public examples, not only of thoroughly good sanitary arrangements, but also of the defects existing in ordinary houses, the committee have, with the sanction of the Executive Council, undertaken to supervise the erection of two model dwellings in the grounds of the exhibition, one of which will show, as far as can be done on the limited scale, a house with good sanitary arrangements, while the other will show the usual defects. In the latter case, no attempt will be made to exaggerate the ordinary conditions; but the object will be to reproduce accurately a state of things unfortunately but too common. Besides these typical illustrations, the committee will be glad to receive from manufacturers whatever examples they may think proper to submit for exhibition of the articles indicated by the classification. It is to be borne in mind that in all cases the exhibits must have a distinct bearing upon health, and that architecture or building construction generally is outside the scope of the exhibition. The exigencies of space will not permit the executive of the exhibition to invite contributions illustrative of schemes for drainage, water supply, &c., applicable to towns or large districts, and it is therefore to be understood that the exhibits must be confined to domestic sanitation alone. The committee would impress upon exhibitors the desirability of, as far as possible, exhibiting their own manufactures only, not those of other makers; and also of restricting their exhibits to typical examples of their appliances, and of not sending more than a single example of each article. Indeed, the committee cannot undertake to find space for things which are substantially duplicates of one another. As the exhibition will be a place of popular resort, and is intended for the instruction of the general public rather than specialists, it will be desirable that exhibitors of sanitary wares should assist the committee in making such arrangements as will bring the articles which it is necessary to show before the notice of the public in a manner as agreeable as possible.

## LEGAL.

**Supreme Court of Judicature. Court of Appeal.—Jan. 28.**  
(Before the LORD CHANCELLOR, the LORD CHIEF JUSTICE OF ENGLAND, and LORD JUSTICE COTTON.)

HART v. HOBBS.

LIGHT AND AIR CASE.

This was an appeal by the plaintiff from the dismissal by Mr. Baron Pollock, sitting for one of the Judges of the Chancery Division during last year's Winter Circuit, of an action to restrain an alleged obstruction by the defendant of the access of light to the plaintiff's surgery. The plaintiff, who had died since the commencement of the action, early in 1882, was lessee and occupier of a house known as Stone's End House, Blackman Street, Borough, the back of which abuts on Montague Street, and he used for the purpose of his profession two rooms on the ground-floor facing Montague Street, one of which was used as a surgery and dispensary, the other as a consulting-room, and the rooms had, it was alleged, been so used for more than 20 years. The room used as surgery and dispensary is lighted by a window facing Montague Street, 4 feet above the ground and 3 feet 7 inches high, also by a skylight in the roof slanting towards Montague Street, and by a door with a fanlight above, also opening into Montague Street. The consulting-room is lighted by a window facing Montague Street. The land on the Montague Street side was until recently occupied by the old Queen's Bench Prison, the external wall of which was about 20 feet from the house and 32 feet high. The prison was pulled down in 1880, and in November 1881 the plaintiff discovered that the defendant was erecting extensive buildings, to be let out in lodgings, and carrying them as high as, if not higher than, the prison. The plaintiff complained that the walls of the defendant's new building would greatly interrupt the access of light to his surgery and consulting-room. An *interim* injunction had been obtained in January 1882, and the action was brought to trial for the purpose of obtaining a perpetual injunction and damages. The defendant alleged that the dispensary was lighted

wholly by a skylight, that the other room was not a surgery, but was only used as a waiting-room, that the skylight was obscured by paper and paint, and the window by bottles and other medical apparatus, and that the window of the consulting-room was obscured by a large case containing plants and by dark-coloured pictures, painted on glass, and suspended against the window-panes, so that the plaintiff did not care to get as much light as he could have. The defendant further stated that the frontage of the new building was set back about 9 feet further from the house than the old wall of the prison; and that the light on the whole was as good as formerly. The plaintiff, as already stated, had died since the commencement of the action, and the person who had purchased the business was not called as a witness. The deceased plaintiff's mother, who had lived in the house for many years, together with two or three professional witnesses, surveyors, gave evidence at the trial for the purpose of proving that the light had been materially diminished by the defendant's building operations. It was admitted, however, in cross-examination, that operations had been performed in the surgery since the alleged obstruction, though it was at the same time stated that there was a great difference in the light. At the trial of the action in February 1883, Mr. Baron Pollock being satisfied upon the plaintiff's evidence that no case of substantial interference with the access of light to the surgery had been established, and also that the letting value of the premises was not lessened, gave judgment for the defendant, and dismissed the plaintiff's action with costs. From this dismissal the plaintiff now appealed.

The Lord Chancellor was understood to say that the plaintiff had entirely failed to sustain the burden of proof which rested upon him, of showing that there had been a substantial privation of light sufficient to prevent the plaintiff from carrying on his accustomed business on the premises as beneficially as he had formerly done. Upon the evidence he could not differ from the conclusion at which the learned Baron had arrived, and the appeal, therefore, substantially failed. From what occurred, however, during the progress of the action, he thought that the action should not have been dismissed absolutely; and the order of the Court below must be varied to this extent, that upon the defendant undertaking not to raise his building any higher there would be no order except that the plaintiff should pay all costs incurred subsequent to the *interim* application for the removal of the buildings complained of, and also the costs of the appeal.

The Lord Chief Justice and Lord Justice Cotton concurred.

## ARCHÆOLOGY.

**Malcolm Canmore's Tower, Dunfermline.**—Mr. Hunt of Pittencrieff, Dunfermline, has arranged for the restoration of Malcolm Canmore's Tower. The tower is situated on the grounds of Pittencrieff, and about 150 yards to the west of the palace ruins, and has been in such a dilapidated state for many years back that strangers with difficulty could find out the site of the old royal residence, designated in some historical works "Dunfermline Castle." During the past year Mr. Hunt has greatly improved his property adjoining the palace—Crown property—and now the circular walls of the tower have been laid bare at every point, and on the top of the massive foundation a wall two feet in height has been built with the stones of the old palace fence. From the excavations there is every reason to believe that the building, though of a simple kind, has been a massive structure. Hewn stones were found during the excavations, which correspond in every particular with the palace ruins and the outer wall, which has just been replaced by a more modern fence. After the partial restoration of the tower has been effected, it is Mr. Hunt's intention to cover the walls with ivy, &c. Very little is known of the tower previous to 1069-70—the occasion of Malcolm's nuptials. It was here the King was married to Queen Margaret. The means that are being taken to preserve the once-castellated palace of Malcolm III. seem to be very effective.

## ART WORKMANSHIP.

**Stained Glass.**—Two stained glass windows have been recently put in Brayton Church, Selby, Yorkshire, the gift of Mrs. Smith, of Hambleton House, Selby. One, a window of two lights, has been erected "To the memory of William Thomas Smith, born December 21, 1850; died December 26, 1861," the subjects being *The Incredulity of St. Thomas* and *The Martyrdom of St. Stephen*. A three-light window at the east end of the south aisle represents *Our Lord appearing to His Disciples after the Resurrection*, under floriated canopies, with ornamental bases, having a twisted label with text, and inscription "To the memory of William Thomas Smith, born January 10, 1810; died December 18, 1882." The windows were executed by the firm of Messrs. Ward & Hughes, of Frith Street, Soho Square, London, who executed the other painted windows in the church.

**Stained Glass.**—The east window of St. John's Church, Paddington, has recently been filled with stained glass in the Late Perpendicular style. The window, which is a seven-light one, contains in the centre light two figures, namely, that of Our Lord occupying the upper panel, and that of David, as a shepherd, the lower panel. In the three lights on the left hand of the centre light two of the parables are represented—*The Good Samaritan* and *The Prodigal Son*; in the three lights on the right hand are two subjects, illustrating *Our Lord teaching from a Boat on the Seashore* and *The Miraculous Draught of Fishes*. The tracing contains figures of the twelve Apostles, angels, &c. The window was designed and executed by Messrs. Heaton, Butler & Bayne, of London, upon whom it reflects great credit. Mr. A. W. Blomfield, M.A., designed the new stonework and supervised the carrying out of the window.

### CHURCH BUILDING AND RESTORATION.

**London.**—The church of St. Helen, in North Kensington, near Wormwood Scrubs, has been consecrated. The site, which was given by Mr. St. Quentin, offered many difficulties, and in consequence the nave of the new church is nearly square, and the centre of the chancel does not range with the axis of the nave. The walls are of red brick with Bath stone dressings. The roof is supported by iron columns. There is a spacious crypt which will be used for parochial meetings. The architect is Mr. Henry Currey.

**Stretford.**—Plans have been prepared by Mr. G. T. Redmayne for the proposed mission church and chapel of ease for St. Matthew's parish church, Stretford. The site has been given by Sir Humphrey de Trafford, and building operations will commence at an early date. The design is Early English, and provision will be made for 280 sittings.

### NEW BUILDINGS.

**St. Paul's Mission Hall, Walworth, S.E.**—This hall, which is in connection with St. Paul's, Lorrimer Square, was opened on January 24. The building will seat about 800 adults, and has cost 2,400*l.*, including heating apparatus, gas fittings, reversible seats, wood-block floor, &c. The builders are Messrs. H. Burman & Sons, and the architects Messrs. Romaine Walker & Lannes, of 19 Buckingham Street, Adelphi, W.C.

**Royal Eye Hospital, Manchester.**—At a meeting of the subscribers, which was held on Tuesday, the Mayor of Manchester said that the committee invited plans from six architects whose experience they thought would best fit them to design a good hospital. It was pointed out that what was wanted was a good substantial building, with accommodation for 100 beds; that the committee did not wish to spend money on architectural display, but that the cost should be about 100*l.* per bed. The plans received varied very much in price, the highest being 34,000*l.* and the lowest 9,850*l.* As the latter plan was considered by the Board, as well as by an expert whom they employed, to contain all that they required, and as the tenders received from builders also agreed with the amount of the estimate, the work was entrusted to Messrs. Pennington & Bridgen, as architects, and Messrs. R. Neill & Son, as contractors. The latter had agreed to finish the building by the end of October. He was quite sure the hospital would be a credit to all concerned, as it contained all the requirements which modern science demanded, and all the comforts which the patients could desire. Objections had been raised to the site, but it was the best and cheapest available. It had also been said that the Board ought at any rate to have a receiving room in the middle of the city, but this could not be without incurring an expenditure which they did not feel justified in permitting. The actual cost of the site was a little more than 5,000*l.*, and it was anticipated that the whole cost of the new hospital, including land, buildings, and furniture, would not exceed the amount stated in the appeal which was issued to the public—i.e. from 15,000*l.* to 20,000*l.*, a result which could not have been obtained if a more costly site had been chosen.

### ENGINEERING WORKS.

**Glasgow Bridge.**—A report has been prepared by Messrs. Bell & Miller, at the desire of the Bridge Trustees, on the present condition of the Glasgow or Jamaica Bridge. The authors say:—In our report of December 20, 1880, we pointed out the serious fractures which had taken place in the arch-stones of all the arches. We have made a careful examination of these, and find that no change has taken place since that time, which confirms the opinion that these must have been made by some exceptionally heavy weight passing over the bridge at some former period. The wise restriction which was made by the trustees at that time to exceptionally heavy weights passing over the bridge, and limiting the weight to 12 tons upon any vehicle or lorry, has had the effect of arresting any further injury to the arches, and shows that they are still sufficiently strong for any traffic under that limit. We also carefully examined all the piers, and are happy to state that

there is not the slightest indication of any subsidence or fracture of any kind. It may therefore be inferred that, so long as the present conditions exist with relation to the depth of the river, the foundations are of sufficient stability for the traffic now passing over the bridge. We made a series of soundings and sections on the same lines as formerly, in order to ascertain what changes had taken place in the bed of the river. It will be recollected that in 1875 considerable scouring had taken place in the bed of the river immediately above the bridge, so much so as to raise apprehensions for the safety of the bridge in the event of this deepening action approaching the foundations. The soundings which we took in 1880 showed that a great change had taken place from the removal of the weir in the interval having brought down a vast deposit of *débris*, which raised the bed of the river to a great extent, and filled up the deep channels which were approaching dangerously near the bridge. The sections which we have now made do not differ greatly from those of 1880, except on the north side of the river, where a considerable deepening has taken place, which may have been partly caused by dredging for navigation purposes. However, there are no deep-water channels sufficiently near to affect the foundations of the bridge. Altogether, we consider the bridge to be quite secure at the present time.

### GENERAL.

**Mr. Collin Hunter**, landscape painter, has been elected an Associate of the Royal Academy.

**A Collection** of oil paintings and water-colour drawings, valued at 10,000*l.*, has been bequeathed to the town of Blackburn by the late Mrs. R. B. Dodgson. There are eighteen works in oils and thirty-six in water colours.

**The Castellani Collection** will be sold in Rome on March 15. It contains a great number of small terra-cotta figures of the Tanagra type, vases, and bronzes, Mr. C. T. Newton, C.B., will represent the British Museum at the sale.

**A Monument to the Late Dean Stanley** has been placed in Rugby Chapel. It is the work of Mr. J. E. Boehm, R.A., and consists of a recumbent figure of the late Dean clad in surplice and stole.

**Mr. George Tinworth** is engaged on a low relief in white marble to illustrate Mr. Edmund Gosse's poem, "The Sons of Cydippe."

**The Manchester Academy of Fine Arts** have selected Messrs. Bright Morris, W. Herbert Johnston, George Hayes, and William Artingstall to form the hanging committee for the spring exhibition, which will be open to private view on the 19th inst.

**A Cottage Hospital** is to be erected in Dunoon, from the designs of Mr. H. Higgins, of Glasgow.

**A Masonic Hall** is to be erected in Corn Exchange Street, Cambridge.

**Messrs. Horsfall & Williams**, of Halifax, have obtained first, second, and third places in the competition for the new schools of Lightcliffe.

**A Gallery** is to be added to the Carnegie Baths, Dunfermline, from the designs of Messrs. Campbell Douglas & Sellars.

**A Mechanics' Institute** is to be erected in Dumfries on the site of the old prison, if sufficient funds are forthcoming. The estimated cost is 15,000*l.*, for which sum it is expected that a hall to seat 1,700 people, a smaller hall, library, reading-room, conversation-room, &c., with residences for librarian and caretaker can be constructed.

**Three Surveyors of Ecclesiastical Dilapidations** have been appointed in the diocese of Peterborough, viz., Mr. H. N. Townsend, of Peterborough, for the archdeaconry of Northampton; Mr. C. A. Macaulay, of Leicester, for the archdeaconry of Leicester; and Mr. C. J. Traylen, of Stamford, for the archdeaconry of Oakham.

**The Breakwater of Port Erin**, Isle of Man, which was constructed at a cost of 70,000*l.*, was entirely swept away in the gale of Saturday last.

**Mr. Charles Steinitz**, of the London Parquetry Works, Grove Lane, Camberwell, has been appointed parquetry manufacturer to the Prince of Wales. It is just forty years since this, the first parquetry manufactory in England, was established under the patronage of the late Prince Consort.

**The Manchester Ship Canal Bill** has been found to comply with the Standing Orders, although the limits of the low-water channel were not shown on the plans. The total estimated cost of the works is 6,904,000*l.*, including 3,920,000*l.* for the canal works, 1,390,000*l.* for the improvement of the estuary, and 1,390,000*l.* for docks at Manchester and Warrington.

**An Episcopal Staff** has been presented to Bishop Eden for the use of the see of Moray and Ross. It was designed by Mr. A. Ross, architect. The shaft is of ebony, while the crook, the tabernacle crook below it, the foot, and some ornamental bands which encircle the staff at regular intervals, are of silver gilt. Within the crook itself, and entirely spanning it, there is a silver gilt cross of Celtic character, enriched with amethysts and topazes, and below the crook there is grouped around the shaft a series of five canopied niches, elaborately ornamented, containing figures of saints.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 2, 1884.

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."*

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### COMPETITIONS OPEN.

**ABERDEEN.**—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

**BLOEMFONTEIN.**—Mar. 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

**KNIGHTON.**—Feb. 21.—Plans are required for a Stone-built Workhouse for 120 Inmates. Mr. E. H. Deacon, Clerk to the Guardians, Knighton, Radnorshire.

**LEICESTER.**—March 1.—Designs are invited for a Block of Buildings proposed to be erected on the South Side of New Entrance to the Market Place. Premiums of £25 and £15. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

**LONDON.**—March 1.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for

the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

**NEWCASTLE-ON-TYNE.**—March 29.—Designs are invited for Baths and Washhouses, to be built on three sites within the City. The City Engineer, Town Hall, Newcastle-on-Tyne.

**WIDNES.**—Mar. 20.—Designs are invited for Public Offices and Town Hall. Mr. J. T. Allen, Public Offices, Widnes.

### CONTRACTS OPEN.

**ADVIE.**—Feb. 6.—For Construction of Iron Lattice Girder Bridge. Mr. Barnett, C.E., Waterloo Station, Aberdeen.

**BACUP.**—Feb. 2.—For Building Chapel and School at Troughgate, Britannia. Messrs. Maxwell, Tuke & Hurst, Architects, 175 Lord Street, Southport.

**BANGOR.**—Feb. 4.—For Addition of South Aisle and other Works to St. James's Church. Mr. Henry Kennedy, Architect, Bangor, North Wales.

**BARNSELY.**—Feb. 16.—For Building House and Shop. Messrs. Dixon & Moxon, Architects, 5 Eastgate, Barnsley.

**BELFAST.**—Feb. 2.—For Building House and Premises. Mr. Edward J. Byrne, Architect, 4 Waring Street, Belfast.

**BELPER.**—Feb. 4.—For Extension of Cowhill Board School. Mr. George Eyre, Architect, Codnor, Derby.

**BRADFORD.**—Feb. 7.—For Building Warehouse, Leaven-  
thorpe Mills. Messrs. Milnes & France, Architects, 99 Swan Arcade, Bradford.

**BRUMBY.**—Feb. 20.—For Building Cemetery Chapel, Lodge, Walls, and Entrance-gates. Messrs. Bellamy & Hardy, Architects, Broadgate, Lincoln.

**BURNLEY.**—Feb. 2.—For Building Baptist Schools. Mr. H. Smith, Architect, 25 Nicholas Street, Burnley.

**BURSLER.**—Feb. 4.—For Building Spur Manufactory and Five Dwelling-houses. Mr. G. B. Ford, Architect, Burslem.

**COVENTRY.**—For Building House. Messrs. G. & I. Steane, Architects, 22 Little Park Street, Coventry.

**CIRENCESTER.**—Feb. 5.—For Construction of Brick Gas-holder Tank. Mr. T. Newbigging, C.E., 5 Norfolk Street, Manchester.

**DUKINFIELD.**—Feb. 4.—For Building Fireproof Mill. Messrs. Stott & Sons, Architects, Oldham.

**ECCLESFIELD.**—Feb. 9.—For Building Board School at Burncross. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

**ELGIN.**—Feb. 2.—For Building House in Bishopsmill. Messrs. A. & W. Reid, Architects, Elgin.

**EWELME.**—Feb. 8.—For Completing House. Mr. J. S. Dodd, Architect, 6 Forbury, Reading.

**FAVERSHAM.**—For Building 120-quarter Malting with Ale Stores. Mr. R. Waite, Architect, Duffield, Derby.

**FELIXSTOWE.**—Feb. 5.—For Building Fourteen Houses. Mr. William Eade, Architect, Post Office Chambers, Ipswich.

**FORRES.**—Feb. 2.—For Building Coach Factory. Mr. J. Milne, Architect, Elgin and Forres.

**FORRES.**—Feb. 5.—For Building Dwelling-house. Mr. J. Milne, Architect, Elgin and Forres.

**FYLANDS JUNCTION.**—Feb. 6.—For Building House. Mr. William Bell, Architect, North-Eastern Railway Offices, Northgate, Darlington.

**GRAVESEND.**—Feb. 6.—For Relief Office and Alterations to Casual Wards. Mr. W. J. King, Clerk to the Guardians, 4 Berkeley Crescent, Gravesend.

**HANLEY.**—Feb. 8.—For Building Presbyterian Church. Mr. G. W. Bradford, Architect, Miles Bank Chambers, Hanley.

**HENDON.**—Feb. 15.—For Construction of Sewers. Mr. John Pollard, C.E., Hendon.

**KILLARNEY.**—Feb. 4.—For Execution of Works of Water Supply. Mr. Robert Denny, C.E., Tralee.

**LIANDUDNO.**—Feb. 2.—For Additions to Queen's Hotel. Mr. G. F. Felton, Architect, Estate Offices, Liandudno.

**LICHFIELD.**—Feb. 6.—For Alterations to Premises. Mr. James Wallis, Market Place, Lichfield.

**LOCHGILFLEHEAD.**—Feb. 2.—For Building Church. Mr. J. Honeyman, Architect, 140 Bath Street, Glasgow.

**LONDON.**—Feb. 14.—For Additions. The Horological Institute, Northampton Square, Clerkenwell.

**MARKET HARBOROUGH.**—Feb. 6.—For Building House. Mr. J. W. Wits, Architect, Market Harborough.

**MEXBOROUGH.**—Feb. 4.—For Construction of Iron Pipe Sewer (2,200 yards), with Manholes, Lampholes, Flushing Tanks, &c. Mr. George White, Engineer to the Local Board, Market Hall, Mexborough.

**MIRFIELD.**—Feb. 5.—For Construction of Loading Shed. Mr. J. H. Stafford, Hunt's Bank, Manchester.

**MOUNTAIN ASH.**—Feb. 3.—For Building 100 Workmen's Houses. Mr. Walter Bell, Merthyr Vale, Merthyr Tydfil.

**NATLAND.**—Feb. 11.—For Building Home. Mr. D. Brade, Architect, 5 Bridge Street, Kendal.

**NEWCASTLE-UNDER-LYME.**—Feb. 4.—For Building Post-Office. Mr. J. Pattison, Borough Surveyor, Newcastle-under-Lyme.

**NEWHEY.**—For Building Two Houses and Alterations to Union Buildings. Messrs. Butterworth & Duncan, Architects, 4 South Parade, Rochdale.

**NORTH SHIELDS.**—Feb. 8.—For Building Sunday Schools, &c. Mr. T. Southron, Architect, 70 King Street, South Shields.

**PATENT WROUGHT-IRON SASHES WITH WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards.)

ORDINARY WAREHOUSE AND SCHOOL SASHES.

VENTILATOR

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being clipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## THE ROYAL GOLD MEDAL OF THE INSTITUTE OF ARCHITECTS.

R. BUTTERFIELD is to be, if all goes well, the Royal Gold Medallist for 1884; and no one need have any objection to congratulate him, as a representative artist, upon the honour which his nomination by the Council confers upon him. As everything requires a little explanation from time to time, we may perhaps as well explain that the Royal Gold Medal of Architecture is a badge of distinction which Her Majesty QUEEN VICTORIA, at an early period of her beneficent reign, was pleased, on the persuasion of the late Earl DE GREY, then the permanent and highly useful President of the Institute of Architects, to place at the disposal of the Institute yearly, for bestowal upon an architect or architectural author, native or foreign, who might be deemed worthy of the honour. It has always been awarded with due consideration for a high standard. At first it was supposed by some to be intended as a special prize for newcomers in the field of architectural popularity, and there is in existence somewhere, if we mistake not, one application at least which was sent in by the writer of a book—of course one of the highest order—requesting that his claims might be duly weighed as a candidate for the reception of it; but the leaders of that day at once declared in favour of its being made, if possible, the very supreme distinction of the profession, and, with one or two more or less pardonable exceptions, which serve rather to emphasise the rule otherwise observed, the list of medallists, now of considerable length, exhibits the names of those only, both at home and abroad, who are recognisable as princes in architectural art and letters.

It is to this most honourable company that Mr. BUTTERFIELD is now proposed to be added. The first step is of course all that has yet been taken; the Council of the Institute has proposed his name to the general body for approval. Our readers may not have all forgotten that a few years ago Mr. RUSKIN was so nominated, and rejected the nomination with not a little disdain. "Was this a time," he exclaimed, after his manner, "to be giving and receiving medals?" Certainly not; and so Mr. STREET had it in his stead, not even thinking it worth his while to regard the circumstance as of any moment that he was receiving it, so far as matter of form went, on literary and not artistic grounds; it being the turn of literature that year to take it. Since that time, however, the Council have adopted the precautionary measure of inquiring of their nominee beforehand whether he will accept the medal; a course which surely need scarcely be too long pursued, in view of the fact that none but a RUSKIN has ever refused it, so that no other precaution seems really to be needed than the simple avoidance, advisable on many other accounts, of transcendentalists as nominees. Poor BURGESS once amused and scandalised a meeting of the Institute by suggesting as a "happy thought" that the medal might be "shot for by the Artists' Corps;" but if he himself had lived a little longer, eccentric as he doubtless was in many ways, not only would he have been offered the honour, but he would have rejoicingly accepted it.

It is a very curious circumstance that Mr. BUTTERFIELD has been twice nominated by the Council for this same medal—in days now somewhat remote—and twice rejected by the general body. On one occasion Sir DIGBY WYATT was substituted, and on the other Sir JAMES PENNITHORNE. The reason for this was easily understood at the time. It was when the High Church school of architects, in which Mr. BUTTERFIELD was then a more conspicuous standard-bearer than now, although never aggressive like some of his colleagues, was viewed with widespread distrust. Mr. SYDNEY SMIRKE, for instance, was drawn from his comparative retirement to vote, and even to make a somewhat heated speech, against him. Mr. STREET, as another example, was stupendously offended at his rejection. It is to the credit of the rejected nominee of that day that he makes no objection to be nominated again, at

a time when he is a less prominent partisan, and when his partisanship is of far less importance. It is equally to the credit of the Council, perhaps, that in such circumstances they should revert to his claims.

Artistically we regard Mr. BUTTERFIELD as being well worthy of the honour. As a representative of individualism in church art, his merits are as unquestionable as his modesty has been praiseworthy. He is not even a member of the Institute. Perhaps the phase of architecture to which he has so long and persistently devoted his great powers of characteristic design may not much longer retain its hold upon the English public; but, as we have often been proud to say in *The Architect*, it has done its work well for England, and can never be overlooked in history for many ages to come.

## FRENCH ARCHITECTURAL ORGANISATION.

THE paper read on Monday evening at the Institute by Mr. W. H. WHITE, the present working secretary of that body, although it attracted but a small audience, and scarcely evoked anything like enthusiasm (except in respect of an occasional trick of humour, which is peculiar to the author), no doubt acquired a much greater importance when commented upon, or rather followed up, by the suggestive remarks of Mr. PHÉNÉ SPIERS, Mr. CATES, and Mr. ROBINS; and we are still more hopeful that good may come out of it when we observe that an adjourned discussion of the collateral questions thus raised was unanimously decreed by the meeting. Adjourned discussions, it is true, are not generally fortunate at the Institute. Perhaps it may be because, as librarians tell us, we live in a frivolous age; but at any rate the audiences on such occasions are too frequently quite inadequate, and the speeches rendered rather devoid of liveliness thereby. But it may be different in the present case, and we hope it will.

In the article of organisation it is well known that our smart neighbours across the Channel are beyond compare. It does not appear that a Frenchman on foreign ground is as a rule so happy in this respect, but on his own soil his arrangements are perfect. Not only so, but his native love of display and unflinching self-consciousness and self-confidence seem to have the effect of stimulating him to administrative exertion where a Teuton, or even a Latin of any other family, would be rendered less triumphant than ridiculous. Perhaps he requires, as part of the play, that he shall have Frenchmen to command and French affairs to administer, other people and other people's affairs only producing a waste of his peculiar energy as if in flogging dead horses. At any rate, there are still a thousand and one things, of great importance and of small, in which we are compelled to acknowledge every day that "they do these things better in France," in one sense or another of the language.

Amongst the rest, the organisation of artistic culture and artistic dignity in respect of architecture, as compared or contrasted with the same in England, must be acknowledged to be of a signally ambitious order. The "higher education," as the phrase now goes, of professional architects in France, is a thing of mere wonder to us. The official eminence, also, of leading practitioners is no less astonishing. The typical career of a first-class architectural designer is to be traced in this way. As a boy he has made his mark in some local free school of design. He reaches Paris, and is taken into the great metropolitan school, the instruction being still at the expense of the State. He enters a private *atelier* as well, but this does not cost much. He competes for prizes—prizes of mere honour and glory—continually. He is getting into manhood, and in England might be already *paterfamilias*, when at length he wins the *Grand Prix*, and is sent at the public expense as a *pensionnaire* to Rome. There he enters upon a fresh course of study, and pursues for several years the contemplation of the antique. At length, when he returns to France, now actually thirty or five-and-thirty years of age, he is rewarded with a subordinate salaried situation on some of the building operations of the Government, and then he begins one more course of study. Having acquired during the past twenty years the art or knack of designing the superficiality of architecture *à la mode*, he now has to learn that which we in England call the practical part of it. At what advanced age he becomes, after all these preliminary stages of grubhood, a perfect *imago*, who may take flight on his own wings into the free

space of "independent practice," is quite a matter of accident ; and indeed it is often the case, apparently, that he aspires to nothing at all in the world of business beyond promotion in the supervisorship of Government buildings—having most emphatically "only one job on his hands at a time" (as some of our church architects used to say), and possibly only that one job for the whole of his life. Meanwhile, as he attains to somewhat advanced years, he arrives at very great honour, which is signified in the usual way by academical titles, enrolment in the Légion d'Honneur, and membership of the "Institut" itself—the pride and paragon in French estimation of all development of intellectual organisation. When he dies—probably in the lonely *appartement* of a bachelor—he has speeches delivered over his grave, lauding his merits to the skies of Père-la-Chaise as the designer of a single edifice, and the wearer of a dozen decorations. May he rest in peace !

But whether a prosperous architectural practitioner in England, supporting by private enterprise a large and happy household, will envy all this, and be anxious to surrender what he has for what he has not, we dare not ask. Academical culture is no doubt a grand result, and academical dignity oftentimes a noble reward ; and we could take in England, it need not be denied, a good deal more into the profession of architects of culture and dignity both ; but one cannot help thinking the success of a clever French architect in England would be a much better thing, and that of a clever English architect in France a good deal worse, if they were to exchange places, the one for the sake of glory, and the other for that of the more substantial fare upon which England is colonising the world.

### THE INCIDENCE OF BUILDING RISKS.

[BY A CORRESPONDENT.]

THIS subject, which is commented upon in the first article of *The Architect* of last week in connection with a paper read by Mr. RICKMAN at the Surveyors' Institution on January 28, is worthy of further consideration, as there appears to be much misapprehension thereon. In these remarks, I propose to restrict the consideration of risks to the case of a contract between a building owner and a builder, when there is to be, as defined by Mr. RICKMAN in his paper (c) "A fixed sum for the whole obtained from quantities furnished by a measuring surveyor." I start with the postulate that in every building contract there must be risks ; and my contention is that these risks, with certain defined exceptions, should fall on the builder, he receiving his own valuation for them and having them all placed before him before he states the amount of his tender. A building owner, as a rule, knows little or nothing of the risks to be encountered in the erection of a building. In the exceptional case of a building speculator who makes it his business to build, he usually knows too much, and is the worst kind of employer a builder can have. But in an ordinary case a building owner only knows that he wants a certain building, and is prepared to pay a certain price for it. If he is wise he employs an architect, not, I think, as Mr. RICKMAN says, "to minimise the risks for him," but to set forth by drawings and specification what is required to be done, including the risks contingent on doing it. The architect, if he is wise, in the interest of the building owner employs a surveyor to prepare bills of quantities, setting forth all the materials and labour required for the efficient carrying out of the work, and also setting forth any risks, beyond the ordinary risks, which the builder may have to encounter. For there are two classes of risks : (1) ordinary risks, or those "which go without saying ;" and (2) those which may be special to the work ; and it is to the latter of these that the attention of the builder need be drawn in preparing the bills of quantities. These bills of quantities are placed before builders to enable them to prepare their estimates ; and assuming them to be competent men they exercise their discretion in pricing out each item in the bills, and by so doing obtain a total for their estimate. If a builder finds that from any cause he objects to take the risks which will be imposed upon him, he may decline to tender, and the building owner loses the advantage of that builder's experience as to the value of the work. There have been cases in which, from the risks being considered too onerous, all the builders invited have declined to tender, and the conditions have had to be remodelled. Following the schedule of risks given by Mr.

RICKMAN as considered to attach to builders, the following may be taken as ordinary or necessary risks, namely, (1) changes in the price of labour ; (2) alteration in the efficiency of labour ; (3) changes in price of materials ; (11) the idiosyncrasies of architects ; and (13) the whims of clerks of works. All these items may involve serious risks, but they must be taken by the builder if he thinks fit to contract for the work. As to (1) changes in the price of labour, of late years this has been almost always against the builder, rates of labour rising and very rarely falling. The builder making his estimates has to look ahead and forecast the state of the labour market. If he sees a prospect of a rise in the market during the time allowed for the execution of the work, he should add such a percentage as he considers will cover him from loss by such a risk. This I call "insurance against risk." As a man of business the builder should calculate this risk as surely as he prices out any definite item in the existing rates of labour and materials. No builder should undertake any risk without considering that he has the equivalent for such risk included in his estimate ; the building owner must pay for a builder taking such risk. Had he employed his own labour at weekly wages the risk would have fallen on him ; and if a rise came, he would have to increase his payments. So in a contract, if the rise does not come, the builder puts the sum he has allowed into his pocket. He has fairly earned it, for he took the risk, and it is an unsound principle in business, to use a sporting term, for a man to stand to be shot at. If the rise comes later than the builder expected, he saves part of the sum provided. If it comes sooner or to a greater extent than he expected, he loses more than he had provided, which loss goes to the diminution or entire swallowing up of the whole estimated profit on the work. But this is one of the chances of war, which must be encountered if business is to be carried on in the way it is conducted in these days. Now there are certain special cases in which the anticipated rise in the price of labour is the essential element of difference in the estimates received from the builders. A notable instance occurred in the case of the estimates for building the New Law Courts. Prudent men forecasted the coming rise in the price of labour, and loaded their estimates accordingly. They were, so to speak, out of the running ; but surely it was better to lose the work than to lose the money which had to be paid in consequence of the rise in the price of labour.

The second ordinary risk is "the alterations in the efficiency of labour." This may be dismissed briefly. Builders have long complained that for the increased price they have to pay for labour they receive less work than they obtained before paying the rise. This may be true, and if true is a fact to be lamented ; but in an ordinary state of trade a builder with capable foremen can fairly estimate the return of work he will get for his money, and it may be that by the use of improved machinery he may be able (I do not say that he will be) to economise on the original estimated cost.

The third ordinary risk is "changes in price of materials." This in a large work may be an immense risk to the builder. The price of labour does not often change ; the prices of materials are constantly varying. It would be an interesting occupation to prepare tables showing by diagrams the varying prices of the principal materials used in building works during the last thirty years. Take such items as bricks, lead, and iron. The prices of these articles will often vary during the execution of a large work to an extent far exceeding any ordinary percentage of profit which may be included in an estimate. Of course the price of materials often fall as well as rise. The builder, in making his estimate, has eminently to use his judgment as to the probable variations in prices of materials. Two courses are open to him. He may make provisional contracts before he sends in his tender, and more definite ones immediately on its being accepted ; or he may run the risk of the market and be his own insurer. In the first case he is comparatively safe ; in the second, he risks a larger gain or loss as events prove, but he takes a large responsibility on himself.

The ordinary risk (No. 11 in Mr. RICKMAN's table), "the idiosyncrasies of architects," is a real one in its real sense, and the long word used a very proper one as expressing "that constitution of body or mind which is peculiar to an individual and which more or less affects his character and actions" (WEBSTER). A builder usually knows the architect with whom he has to deal, and regulates his prices accordingly. How

often do we hear such an expression as "It is worth 5 per cent. more to do work for an architect (say A) than for an ordinary architect." This arises from A's idiosyncrasy. An apt illustration may be given in the various tenders for works given, not many years ago, to a well-known public board, presided over by an able chief, who did not directly superintend works, but constituted in himself a court of appeal, and assisting him three gentlemen, who directly superintended the works in separate districts. The same class of work had to be done; the same general specifications were used, but it was found that tenders for works under the three superintendents (call them X Y Z) varied fully to the extent of 10 per cent., tenders for work under X being 10 per cent. higher than for similar work under Z, while for those under Y the tenders were intermediate, and more than that, the contractors under X could rarely make both ends meet, while those working under Z made a fair profit. Such contrasts of "idiosyncrasies" fortunately are not often to be found, but they must be risked.

Mr. RICKMAN has, however, surely used the wrong word in writing of the "idiosyncrasies of architects as shown in their explanation of their own terms." Grant a little margin to an architect in explaining something that may be ambiguous, still that which is written is written, and should be the contract, and beyond the idiosyncrasy of an architect to explain away the plain meaning of plain words, unless the builder has been foolish enough to submit everything, plain words and all, to the sole decision of the architect.

But, as a rule, architects write uncommonly plain words in the conditions of a contract, and it is the builders and arbitrators who try to wrest these plain words to mean something quite other than the architect in his simplicity had intended. It is not very long since that an arbitrator laughed at the plain words in a contract, that the builder should carry out the works according to the detail drawings (which were not made at the time the contract was signed). It did not occur to his judicial mind that these detail drawings were but drawings at large of the contract drawings which the builder had signed, and that if the builder disputed his liability to carry out any one of the detail drawings, he had his remedy (1) by declining to execute such work as under his contract; and (2) by the arbitration clause which formed part of the contract. But certainly the real idiosyncrasies of architects are a real risk to builders, and so are (13) the whims of clerks of works, many of them very respectable men, but sometimes carrying out "the letter which killeth" alike to the detriment of the building owner and the pecuniary loss of the builder. It remains to treat of the special risks to the builder as distinguished from ordinary risks.

All the ordinary risks hitherto mentioned must necessarily occur, more or less, in every building contract; but each work may have its special risks, and following the schedule given by Mr. RICKMAN, we find (4) "Difficulties arising from having to obtain special materials." The obtaining special materials gives increased trouble rather than risk. If an architect introduces an unknown material into his specifications, it is his duty to give such information to the builders as to the means of obtaining this material, that they may be able to ascertain its cost. If he fails to do this, the building owner will probably suffer. A prudent builder will not tender for work he cannot fairly price, or in common parlance, he will decline to buy a pig in a poke.

Special risk (5) is called "The state of the bottom obtainable for building, and the consequent extent of the foundations of the proposed structure." The real risk a builder has to encounter as to foundations is not set forth in this paragraph, viz., the unexpected difficulties which may be met with in carrying out the works shown on the drawings and specification, i.e., "the getting to the bottom." The state of the bottom, and consequent extent of foundations, is not a risk which an intelligent architect would seek to impose on a builder; it is not a risk which a sane builder would take, except he covered himself far beyond the probable increased expense he might have to incur. The state of the bottom is as clearly a contingency of the estate, and therefore falling on the building owner, as the nature of the strata, whether it be sand or rock; the nature of the site, whether accessible, and therefore advantageous, or difficult of access, and therefore expensive for building. The state of the bottom may therefore be taken from the risks incident to the builder and added to the risks falling on the building owner. But "the getting to

the bottom" remains a builder's risk, and sometimes the most serious he has to encounter. If the foundations are of considerable extent, and the nature of the subsoil is not accurately known, the architect should have one or more large trial-holes sunk to the level of the intended bottom before he asks builders to estimate for the works in the foundations. For they will then be able to see not only the nature of the strata but the probabilities of their meeting with water in the foundations, and having to incur the expense of pumping, which, with the presence of running sand, might increase the expense tenfold beyond that originally expected from superficial inspection. In exceptional cases, where the probability of bad foundations is great, a prudent builder would probably decline to take the risk altogether, and state his reasons for doing so, because otherwise he must load his estimate with so large a sum to insure him against probable loss as would effectually exclude his chance of obtaining the work; or he must take the risk without a sufficient equivalent, which is not business-like. The fair value of the works in the foundations, be they good or bad, should be borne by the building owner, but the risks attaching to them remain with the builder. How great is the risk sometimes attaching to foundations and works under ground most builders have learned to their cost, and there are times when the most careful builder suffers terribly from unexpected difficulties. One instance of risk may suffice. In the building a large workhouse in the Midland counties, the sinking a well was included in the contract. The well was to be 9 feet in diameter and 120 feet deep, and steined throughout with brickwork. No special difficulty was anticipated, and a very moderate price was included for the well in the estimate. The sinking the well progressed favourably till it had reached a depth of about 110 feet. It may be said never to have got any deeper. A running sand was met with which defeated all the builder's efforts, and having spent about 2,000*l.*, and endangered the safety of the new buildings near the well, the attempt to reach the contract depth was abandoned.

(To be continued.)

#### CHRIST CHURCH, CLIFTON.

THE competition for the enlargement of Christ Church, Clifton, which has just been decided, is exciting a great deal of surprise in Bristol, and the history of the transaction suggests the free-and-easy way in which architects can be made the tools of other people. The church was originally designed by Mr. JOHN NORTON, and the tower and spire are so impressive in character as to be one of the landmarks of Clifton, which visitors never forget. If any alterations or additions to the building were needed, the most suitable architect would be apparently Mr. NORTON. But for some unknown reason Mr. WOOD, of Bristol, was consulted several years ago and prepared plans for additions. His plans were set aside for reasons as mysterious as those which dictated his commission. Then Mr. CHARLES HANSOM was requested to undertake the work, and he produced plans which were most carefully worked out. His design was illustrated in *The Architect* some years ago, and, unless we are mistaken, the drawings were utilised to raise subscriptions. In Bristol it was accepted as certain that the additions were to be according to Mr. HANSOM's designs. But to the surprise of the local architects a competition was commenced, and, strange to say, Mr. NORTON undertook the office of reporting on the designs. The result was that the first prize was awarded to Mr. W. BASSETT SMITH, of London, and the second to Mr. E. H. EDWARDS, of Bristol. There are three things we should like to know—first, why Mr. NORTON did not design the additions to his own church instead of examining the work of other men? secondly, why Mr. WOOD's designs were not adopted? and thirdly, why Mr. HANSOM's competitive designs were set aside in favour of those by a London architect? The funds for the work are limited, and there must be some special reason for calling in an architect who lives at a distance, and who must charge travelling expenses. Under the circumstances the victor is not to be envied.

The Bronze Statue of the late Lord Frederick Cavendish has been successfully cast at the studio of the sculptor, Mr. Bruce Joy, West Kensington, and it has been decided to erect it at Barrow. It is to be unveiled by Earl Spencer next April.

## PARIS NOTES.

THE Exhibition of Drawings of the Modern School (*Dessins du Siècle*), organised at the Ecole des Beaux-Arts by the Artists' Association, was opened on Monday, the 4th inst. It contains original sketches and drawings executed by the great masters of the modern school since 1780. Numerically speaking there are 36 by David, 49 by Prudhon, 15 by Gleyre, 27 by Géricault, 38 by Delacroix, 8 by Decamps, 29 by Delaroche, 13 by Gavarni, 32 by Millet, and, among the more modern ones, 27 by Meissonier, &c.

The Minister of Public Instruction has issued a decree modifying the conditions in the competition for the Sèvres Prize. In future the award will be made every two years, and there must be two stages. The subject for competition is a vase or set, at will, after given directions. The sum of 3,000 frs. will be apportioned among the competitors, whatever their number. In this there will be but one prize given, to which the sum of 5,000 frs. is attached. On the recommendation of the jury the model coming second in order of merit may be acquired by the State, at a price to be determined after the competition. The subject selected for 1884 is a boudoir chimney-piece, with supports and scrollwork. The ornaments for the top and the lighting apparatus attached may be included in the design.

A great sale of curiosities and works of arts belonging to Baron de Gunzburg took place last week at M. Georges Petit's art gallery in the Rue de Sèze. Five pieces of tapestry representing scenes from "Don Quixote," after Coypel, were first put up in separate lots, and sold provisionally for a total of 96,000 frs. In accordance with the conditions of the sale, they were afterwards offered in one lot, and finally, after a very spirited contest, fell to Madame Sluys for 140,000 frs. A suite of twelve Gobelin's tapestry panels representing the months, after Audran, were taken by M. Boucheron for 62,500 frs.; a Louis XV. chest of drawers in lacquer, with brass mountings, fetched 23,100 frs. (Foar Bey); a marble bust of Dame Marie Servat, by Houdon, 44,000 frs. (Comtesse de Courval); four Louis XIV. armchairs, 10,000 frs.; a clock of the same period, 12,100 frs.; two chandeliers of rock crystal, 16,000 and 18,000 frs. respectively; a pair of carved consoles, 1,800 frs. The day's sale amounted to 468,120 frs.

The sale of Manet's works at the Hôtel Drouot on Monday and Tuesday last proved a brilliant success, phenomenal prices being reached by many of the pictures. The purchasers belonged almost exclusively to the inner circle of disciples gathered round the founder and chief of the Impressionist School, for, truth to say, both dealers and the general public remained very cold. No doubt the sale will ever be held up by the followers of Manet as a triumphant vindication of his cause in art. The pastels, water-colours, drawings, and lithographs were disposed of for sums varying from 30 to 1,800 frs., while among the oil paintings that fetched high prices may be mentioned:—*Argenteuil*, 12,500 frs.; *A Bal at the Folies-Bergères*, 5,850 frs.; *Hamlet*, 3,500 frs.; *Olympia*, 10,000 frs.; *Washing Linen*, 8,000 frs.; *Nana*, 3,000 frs.; *The Music Lesson*, 4,400 frs.; *Chez le Père Lathuile*, 5,000 frs.; *The Balcony*, 3,000 frs.; *The Barmaid*, 2,500 frs.; *Young Girl in a Garden*, 5,000 frs.; *The Nymph Surprised*, 1,250 frs., &c., &c. The first day's sale produced 71,892 frs. and the second 43,745 frs.—a total of 115,637 frs. in the short space of four hours in all.

Two of the turrets of Notre Dame Cathedral were almost entirely demolished by the gale of last Saturday week, and, in order to prevent any damage from the infiltration of water through the fissures thus occasioned, the work of restoration has been commenced immediately. Decorators are engaged in restoring the vermilion colour on the three large doors of the principal entrance on the square in front of the cathedral. These three doors—known respectively as the *Porte de la Vierge*, the *Porte Sainte-Anne*, and the *Porte du Jugement*—are considered to present the most beautiful specimens extant of Mediæval work in wrought iron. They were thoroughly restored by Boulanger twenty years ago, but since then have not been touched.

The Municipal Fine Arts Committee has drawn up a first list of commissions for paintings, amounting to 300,000 frs., for the reception-rooms of the new Hôtel de Ville. In 1882, on the occa-

sion of the opening, two large fountains, constructed to imitate stone, were erected on the open space in front of the building, and removed immediately after the ceremony. According to the original plan of the architects, these were to be rebuilt permanently and form the principal decoration of the square. The project, however, being objected to on the ground that the fountains would obstruct the view of the building, it has been decided to abandon their construction. In their place ornamental lamps will be erected, with a *parvis* or rotunda before the entrance, similar to that of Notre-Dame. The entire cost of these will amount to only 411,000 frs., or only one-half of the estimate for carrying out the original plans.

A dispute of considerable importance has just occupied the Paris Civil Court. The decision in this case is noteworthy as an application of the old maxim of *caveat emptor*. Mr. Waltner, engraver, purchased from Bourdois & Co. an etching by Rembrandt, known as the "Hundred Guilder Print," for a sum of 3,000 frs. The engraving was mounted on a sheet of vellum paper marked in the corner, in French, "First state—very rare." It is scarcely necessary to explain that the "first state" of an engraving is before the plate has been retouched or modified in any way. There may thus be several "states" of an engraving, and of this particular one there are, in fact, as many as seven or eight. Mr. Waltner subsequently discovered that his copy was not one of the first state, and refused to complete the purchase. This etching in its first state is very rare. Only eight copies are believed to exist, and the possessors are known. Two are in the British Museum; one each at Paris, Amsterdam, and Vienna; a sixth belongs to the Duke of Buccleuch; a seventh to Mr. Holford; while the eighth was sold in 1867 to M. Eugène Dutuit, of Rouen, for 29,500 frs. These original proofs are now estimated to be worth from 30,000 frs. to 40,000 frs. (1,200*l.* to 1,600*l.*) apiece. Experts who were appointed decided that it belonged to the second state, the successive changes the etching underwent being, moreover, mentioned in various works on the art of engraving. The Court finally gave judgment against Waltner, ordering him to take the work and pay the 3,000 frs., with interest and costs, on the grounds that the engraving is really by Rembrandt, although not a first proof, answering to the expectations of Waltner, and that that gentleman was possessed of the artistic knowledge necessary to judge of the value of the copy. Furthermore, that although the false inscription was to be regretted, it was not the determining cause of the purchase, nor proved to have been written by Bourdois & Co.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh ordinary meeting of the Institute was held on Monday evening, Mr. Horace Jones, President, in the chair. The decease of John Henry Parker, C.B., hon. member, was regretfully announced.

The PRESIDENT then stated that the Pugin Travelling Studentship had been awarded to Mr. J. G. Sankey, and the Godwin Bursary to Mr. F. R. Farrow, both awards being for the current year.

## The Royal Gold Medal, 1884.

The PRESIDENT next announced that the Council proposed to submit to Her Majesty the Queen the name of Mr. William Butterfield, architect of All Saints' Church, Margaret Street, W., of Keble College, Oxford, and of various churches, colleges, and domestic residences in England and elsewhere, as the person to whom the Royal Gold Medal should be awarded for the current year.

## Review of the Education and Position of Architects in France since the Year 1671.

The SECRETARY then read a paper under the above title, of which the following is an abstract. The author explained that:—

The starting-point of his brief review, 1671, was pitched upon because it was in that year that the French Minister of State, Colbert, established the Academy of Architecture, at first composed of only six architects, namely, Leveau, Gittard, Antoine Lepautre, Bruand, Dorbay, and Mignard. From the interesting story of its rise, which was given in some detail, it appeared that it grew out of a committee formed to superintend the execution of the famous colonnade of the Louvre after the designs of Dr. Claude Perrault. In the course of a few years the first six architect-academicians were strengthened by the addition of Jules-Hardouin Mansart, François Blondel, Claude Perrault, La-Motte Coquart, Desgodetz, and André Felibien. The last-named, who

was chosen secretary, was remembered for his work entitled "Des Principes de l'Architecture." Levau was the architect of the famous palace of Vaux, barely finished at a cost of eighteen millions of francs, a sum computed by Voltaire a century afterwards as worth double in his time, or 1,440,000*l*. Bruand was the architect of the church of the Invalides, which Jules-Hardouin Mansart spoilt when he surmounted it with his beautiful dome, now covering the tomb of Napoleon. Mignard built the Porte St. Martin in Paris, and Dorbay was the architect of the Collège des Quatre Nations, under whose dome the French Institute has long held its meetings. Desgodetz was best known as the author of the work "Les édifices antiques de Rome," whither he was sent by Colbert to measure and draw the finest buildings. He was also a professor of architecture, and a manuscript of his lectures was presented by M. Guénepin to the Royal Institute of British Architects in 1842. The first address to the Academy of Architecture was delivered by Blondel, remembered also as the architect of the Porte St. Denis, on December 31, 1671, and was prefixed to his "Cours," publication completed in 1683. Salient passages were given from this remarkable address. In Mr. White's opinion it was impossible to regard the literary performances of Blondel, Perrault, Desgodetz, Felibien, and their contemporaries of less note, with other than sentiments of admiration and humility. Indeed, he did not hesitate to assume that the acknowledged excellence of many of the royal and public buildings executed throughout France during the seventeenth and eighteenth centuries was largely due to the precepts taught, the information supplied, and the inquiries instituted by the Academy of Architecture. It was also largely due to the wise and judicious control exercised by successive Ministers of State over the deliberations and works of the Academy, and to the confidence, so happily inaugurated by Colbert, which existed between it and the State. Nowhere was this better shown than in the order to Perrault to undertake a translation of Vitruvius, in the despatch of Desgodetz to Rome to measure the antique monuments, and in the demand made on the Academy to report on the source and quality of the stones used in the old churches and other buildings of Paris and its environs. This last was a memorable task, as the striking details given in the paper showed. An account was next given of the relations not long afterwards established between the new Academy of Architecture in Paris and the Academy of France founded at Rome in 1666, with Errard, President of the Paris Academy of Painting and Sculpture, at its head. He started for the Eternal City with a dozen of his young painters and sculptors in the spring of that year. The French art colony established themselves in the Capranica Palace, and lived there at the cost of Louis XIV., whose successor transferred the Academy seventy years afterwards to the Mancini Palace, where it remained until 1803, when it removed to the Villa Médicis, where it is still housed. From 1666 until the present time a student of painting and a student of sculpture had been sent almost every year to Rome. But during the seventeenth century no architectural student had apparently been admitted to the Academy of France at Rome, nor until 1720 did the *grand prix* in architecture exist. Three years previously the Royal Academy of Architecture was formally incorporated, the number of members being increased to 24. During the fifty-nine years which elapsed between the incorporation and 1776, when it obtained fresh letters patent, 56 students of architecture were sent to Rome. About the middle of the eighteenth century Voltaire wrote his scathing criticism on the Paris of his day, too much of which, it was hinted, applied to the London architecture of ours. Yet even at that moment signs were not wanting, especially in Gabriel's plans for the Place Louis XV., now the Place de la Concorde, approved by the king in 1753, that architecture was righting itself. The academies founded by the monarchy, guided by such statesmen as Richelieu, Mazarin, and Colbert, succumbed in the darkest days of the Revolution, but were re-established as soon as the Republic began to sober down. The history of these institutions, especially as concerned architecture, in their revived form was traced through the periods of the Consulate and the Empire, down to the Bourbon restoration. Louis Philippe reinstated the fifth Academy, that of the moral and political sciences, since whose reign the Institut de France, in spite of unimportant changes, had always consisted of five such bodies, housed in the Palais de l'Institut, originally the Collège des Quatre Nations. It was well known that the Academy of Fine Arts, subdivided into five sections, is composed of fourteen painters, eight sculptors, eight architects, four engravers, six musical composers, with ten *Académiciens libres*, all Frenchmen; ten foreign associates,\* and a permanent secretary. An account was next given of the very important School of the Fine Arts, whose existence might be said to date from the beginning of the present century. It was set up by the Government, and was at first placed under the immediate control of the National Institute; but in 1863-64 Napoleon III. placed it under strict State rule. A survey of its constitution, general working, scheme of studies, and system of competitions for prizes was taken, and the roll of names of illustrious French architects

nurtured in this school or under its auspices, especially at Rome, was gone through. The school was governed by a council, presided over by the director, and consisting of two painters, two sculptors, two architects, one engraver, the permanent secretary or the Academy of Fine Arts, an author (Alexandre Dumas), and three other persons, with eight professors of the school proper and of the studios. The professors teaching in the school were three for painting, three for sculpture, three for architecture, all, with two exceptions, Academicians. There were four painters and four sculptors who attended to the courses of design and modelling, and there were seventeen special professors attached to the school. The prizes in architecture were awarded on the recommendation of a jury, consisting of thirty architects. A diploma had been lately granted by the school, and there was a *concours d'émulation* common to painters, sculptors, and architects. A full description of the French School of Rome was then given, and a digression made, in order to refer to the great and really honourable competition for the new Opera House. It appeared that among the 173 architects who submitted designs nine had been students in the Academy of France at Rome, and eight of these were included in the first batch of sixteen, out of which the jury had to finally choose five. Of the five, four were the works of the students of Rome; and when these five gentlemen were invited in the second stage of the competition to submit complete designs, M. Garnier (student of the Academy at Rome in 1848) was unanimously chosen as the most worthy to construct the Opera House. The open, unlimited competition for that work, which excited Parisian attention in 1861, sufficed to attract men of assured position and of the very highest talent. The drawings submitted, which were all publicly exhibited before the award was announced, were plain, unadorned, unpretentious sketches, made principally by the architects themselves, and sent in, in the majority of cases, without even an attempt at artistic finish. The public, who avoid even the gay and brilliant architectural room of our own Royal Academy, would not have wasted a glance upon such dreary pictures. Hence, perhaps, it was considerate and generous of the French administration, as well as lucky for professional colleagues on the other side of the "silver streak," that the judges appointed to determine the selection of the architect of the new Opera House consisted exclusively of architects. The author of the paper concluded as follows:—

"Yet, patent as are the advantages of a system the magnificent results of which can be judged by a study of the national edifices and public monuments of France, there are many people in that country, and a much greater number in this, who are satisfied that State-supported academies and schools are mere derelicts of Protection, and opposed in every sense to the glorious money-getting principles of Free Trade. But, to my mind, the difference between a body of architects trained under an academic system such as that which flourishes in Paris, and a body of architects left to pick up knowledge in a speculative scramble for employment, is not unlike the difference between an army of soldiers fit to take the field and a scratch gathering of men with muskets. If any plea were needed at the present time in favour of an English architect possessing early in life a scholarly acquaintance with the French tongue, it might be found in the existence of that splendid literature which, during the last 250 years, has helped to raise France to the summit of artistic eminence. It might also be found in the pleasure and profit to be derived from a true appreciation of the evident understanding, the polite consideration, the charm of manner, with which men of science and letters in France treat the ennobling subject of architecture. On the other hand, if anything could add to the depression which a reference to architecture occasions among similar sets of people in England, it might be found in the avowed opinions of many English scientists and authors, successful in their line, and of many political representatives, successful in trade or commerce, whose blind confidence in the practical genius sufficient to make this country rich and powerful has blunted that perceptive faculty which should seek, I think, to crown the edifice by developing, to the highest possible degree, the literary, artistic, and social instincts of the nation. The respect entertained by all classes of Frenchmen for the higher arts has developed with the growth of their academies, and this has been aided by the close contact of academicians under the dome of the Mazarin Palace. Each academy in turn presides over the whole Institute, and last year the Academy of Inscriptions, being at the head, delegated a member who sat as President of the Institute, with a delegate from each of the other four academies as Vice-Presidents, and the Secretary of the Academy of Inscriptions as the Secretary of the Institute. In like manner, each section presides in turn over the academy of which it forms part, and last year the section of Musical Composition was at the head of the Academy of Fine Arts. Thereby it fell to the lot of M. Gounod, the celebrated composer, to sit as president at the annual meeting held on October 20 last, when the *grands prix* in painting, sculpture, and architecture were distributed, together with a large number of other prizes. 'In Paris,' I read in the *Times* of the 18th of last month, 'these great days under the cupola of the Institute are the centre of interest to the whole of the classes which pretend to any cultivation. There is no standard by which a man is measured in France higher than the standard of his performances in literature and art. Wealth

\* The only English architect who is a member of the Institut de France is Professor Donaldson, an *Associé étranger* of that body.

and birth are not allowed by public opinion to have the *pas* of intelligence. Men of letters and great artists have a position, as such, to which with us they have nothing comparable.' If, as I believe, that be really the case, it is largely due to the beneficent influence of a system, prolonged for more than two centuries, by which school, academy, and State have worked together for the national good—a system by which the monuments of Greece and Rome have been brought under the dominion of Frenchmen, and thereby conferred on them the inheritance of intellectual arts that contributed to the glory of Athens, enabling the little Republic to divide with Imperial Rome the homage of the modern world."

The PRESIDENT said the paper formed a complete and comprehensive essay, embodying a very great deal in a very small space, and affording plenty of opportunity for thoughtful consideration. Some of the great architects commemorated in it might afford matter for interesting remark.

Mr. R. PHENÉ SPIERS, F.S.A., said the paper had dealt with an enormous amount of material, but he proposed addressing himself to a somewhat more detailed account than that given in the paper of the peculiar system organised in France for the teaching of students in architecture. Mr. White, perhaps, had not sufficiently drawn attention to the three educational *ateliers* or studios for the profession which were in operation in Paris. The paper mentioned the great change made in 1863 in the organisation of the school, whereby the management and the distribution and award of prizes were transferred from the Institute of France and the Academy. But what was then aimed at was a revolution, to be made by a sort of *coup d'état*, and the whole was due to the prompting of M. Viollet-le-Duc, who had considerable influence with the Emperor. Finding that studies connected with Mediæval art were more or less ignored by the Academy, he endeavoured, in the interest, as he oddly enough said, of freedom of thought, to make provision that all students thenceforward should be taught by teachers nominated by himself. The establishment of the three *ateliers* dated from that period, but it was found impossible to carry out Viollet-le-Duc's proposed reform. Day after day he attempted to lecture, but the students would not listen to him, and he was obliged to give it up. The result was the establishment of the three *ateliers* by way of compromise. Other *ateliers*, however, less closely connected with the school, were allowed to exist. The speaker went on to describe those of both kinds from personal knowledge. He thought the latter numbered about half a dozen in all. The more private ones would originate in the architectural students clubbing together and appointing a professor of their own. The master of the *atelier* to which he himself belonged was M. Questel, who had been so appointed in succession to MM. Blouet and Gilbert, the latter of whom had died, and the former had resigned. Of the system of study pursued in this *atelier*, which was attended by about one hundred and fifty students, Mr. Spiers gave many interesting particulars. Some of those under instruction there were preparing to compete for the *grand prix de Rome*, the course of training for which would last from ten to fourteen years. Others had been studying two, four, or six years; and as the professor naturally gave most of his time to the seniors, these had to coach the juniors, who often profited most from the hints of those but little older or more advanced than themselves. "The accumulation of knowledge thus constantly going on in a fairly conducted *atelier* was thus very great. Each student was in friendly rivalry with his brother students. In like manner, each *atelier* would vie with every other. In this way all would be working together to raise the character of the designs, and to lift higher the standard of attainment. It was impossible to conceive the extraordinary effect this had upon the French students. Curiously enough, if only by way of comparison, there had been, for the first time this year, a competition at our own Royal Academy somewhat like that in the French School of the Fine Arts, in which painters, sculptors, and architects are wont to compete. That innovation had been established since his time, the speaker said, and he knew of it only from Mr. White. Mr. Spiers expressed his gratification that two or three student-architects in the Academy competed this year for a prize offered for the best wall-painting. It was the first instance in which students from the architectural school were admitted as candidates for such a prize, which was naturally meant for painters. The painters proved to be too strong for their new rivals, but it might be hoped that some day a student-architect would snatch a prize from his brethren of the brush. The speaker then gave an elaborate account of the three ordeals to be passed by competitors for the *grand prix de Rome*. He next enlarged on the great advantage possessed by France over this country in the excellent provision made by the Government, by means of its admirable elementary schools of design, for the universal and effective teaching of drawing—an important point which Mr. White had not mentioned. A sketch of the professional career of the architectural aspirant in France and England respectively followed, with suggestions of interesting parallels and contrasts. Mr. Spiers next remarked upon one great difference between the French system and our own, a difference affecting not only our architecture, but our art of every kind, namely, the entire absence here of any study of composition, as contrasted with the great attention paid to that important matter in France. The contrast could be

seen even in the letters written home by French schoolboys as compared with those of our boys. Mr. Spiers concluded by proposing a vote of thanks to Mr. White for his paper.

Mr. ARTHUR CATES said Mr. Spiers had well followed Mr. White, and had given further detail as to the practice of the French school. He had not, however, touched upon one most important element, and that was the recent introduction of the *diplôme d'architecte*, which had been introduced into the Ecole des Beaux-Arts. That was a point of moment, and one to which he thought the Institute might well address itself. He hoped Mr. White's paper when published would give full details of the examination. Mr. Cates proceeded to sketch the history of the question in this country. He recalled its agitation in the Architectural Association in 1854-55, concurrently with M. Adolphe Lance's publication of a *résumé* of his articles on the subject which first appeared in 1855. At the inaugural meeting of the Architectural Association, Sir William Tite, the then President of the Institute, attended, and Mr. Alfred Bailey's opening address touched on the subject. In his opening address on November 5 of that year, Tite reported how surprised he had been at the strong feeling evinced by the Association in favour of an examination, and of something like a diploma. Later on in the session Mr. John B. Papworth brought before the Institute Adolphe Lance's tract, which led to much discussion. Mr. Cates made several quotations from that work, one of them referring to the action taken by the Spanish Government as regards architects in 1801, on which, as well as on the evidence given in the pamphlet of the ripening of the question in France and other Continental countries, as well as in Spain, he commented at large. He added that it would be an exceedingly happy thing for this country if some such principle as was recognised abroad was established in England, namely, that no architect should be employed to superintend the erection of any state building unless he had passed an examination. In the days before the reorganisation of the Ecole des Beaux-Arts there was much hostile feeling in France as to the influence which any compulsory examination might have upon the progress and development of architecture. It was feared that such a system would end in architecture being dictated by the professors of the Academy, and Mr. Cates thought it was mainly on that ground that the earlier efforts to establish something like a diploma failed. Such a feeling was rife in England also in those days, and he could well remember how during his pupilage it was believed that any candidate for a studentship in the Academy who should be daring enough to submit a Gothic design would be sure to be plucked. The step taken by the Ecole in insisting upon examination for the *diplôme d'architecte* was of very great interest to the Institute, for within the last three or four years, after a struggle extending over twenty-seven years, they had at last answered the memorial of the Architectural Association in favour of an obligatory examination for Associates of the Institute. [The memorial of 1855 was here read.] The result of that memorial was the concession of examination, at first voluntary and afterwards made compulsory, for admission to the Institute. He had heard it spoken of with scorn and contempt as a surveyor's examination. Mr. Cates thought it very wrong indeed that any member of the Institute should have so spoken of it, and argued that the curriculum by no means merited such a description, though he regretted it did not follow more closely the lines laid down by the Ecole des Beaux-Arts. The speaker next referred to the system followed in the class for Architecture at the Royal Academy, and of the successive improvements in its organisation introduced under the auspices of the late Mr. Street and its present master, Mr. Spiers. In seconding the vote of thanks, he expressed the hope that the result of the paper would be to advance the interests of the profession in this country, and to strengthen the Institute as representative of that body of architects to which admission could only be obtained by passing an examination, guaranteeing at any rate that minimum of knowledge which every architect should possess.

Mr. E. C. ROBINS, F.S.A., said he was not acquainted with the curriculum of the French School of Fine Arts, but said he had lately had the opportunity of visiting the architectural schools of Germany, and gave some details in attestation of their efficiency. Yet, a German gentleman visiting this country had expressed his surprise that, in spite of the complete education they possessed in Germany, he did not think that they could produce such drawings as he constantly observed in the English professional journals.

Mr. R. PHENÉ SPIERS, on the question of how a student managed to live during the many years he passed at the School of the Fine Arts, said that French students earned an income, slender compared to what similar men expected in England, by assisting architects during a portion of each day, and that the architects permitted their assistants to absent themselves for the purpose of working at the School.

On the motion of Professor KERR, seconded by Colonel PRENDERGAST, the discussion was adjourned. The vote of thanks having been carried by acclamation, the author of the paper acknowledged it, and the proceedings terminated.

**The Private View** of the Nineteenth Century Art Society will be held at the Conduit Street galleries next Friday.

## PETERBOROUGH CATHEDRAL.

A YEAR having elapsed since the first steps were taken for the restoration of Peterborough Cathedral, Dean Perowne has given the following account of what has been done during that time :—

It will be remembered that towards the close of the year 1882 very considerable alarm was occasioned by the state of the great central tower. Indications of danger were evident. A rapid movement was going on in the upper portion of the lantern ; the gaping and unseemly cracks by which it had long been torn and disfigured were widening and fresh rents were visible ; and Mr. Pearson, R.A., the cathedral architect, when summoned to examine and report upon it, recommended that the upper portion should immediately be taken down and that the whole of the central tower and the two eastern piers should be reconstructed.

The restoration committee at their first meeting on January 24, 1883, adopted the report of the architect, and a contract was entered into for the reconstruction of the tower as recommended in the report at an estimated cost of 13,073*l*. Preparations having been made by the removal of the screen and organ, and the nave having been fitted up temporarily for divine service, the actual work of taking down the tower commenced on April 5, 1883.

As the work proceeded it became evident that no expedients for patching up and trying to preserve the tower in its existing state would have been of any use. Lantern and piers alike were of the most wretched construction. The walls of the lantern, dating from the fourteenth century, were mainly composed of rubble and "pit mortar," with a very thin facing of Barnack stone. Two attempts had been made, it was evident, within thirty or forty years to rebuild this lantern. Very considerable fragments of the old Norman tower had been employed in its construction, and, being embedded in the rubble, their mouldings are as fresh as if they had been cut yesterday. Indeed, so much of this old Norman work has been recovered that it may be possible entirely to reconstruct from it the Norman arcading above the arches inside the lantern.

When the piers were reached, which had been crushed and peeled off by the too great pressure of the heavy Norman tower (and one of which, that at the north-east corner of the crux, had been partially rebuilt, probably by the fourteenth-century builders), it was found that they were of no better masonry than the lantern above them. In fact, it would seem as if the fourteenth-century builders had copied but too faithfully the manner of their predecessors.

The core of these great Norman piers was nothing but dust. The pressure on the face of the south-eastern pier had at one time forced out a considerable quantity of this dust, and then the device had been resorted to of turning the mouldings of the pier with their faces inward, so as to fill up the cavity, and the whole was finally strapped together with flat pieces of timber secured in the place of the original mouldings with strong iron hoops. These piers, massive as they were, and designed to carry a heavy weight above them, rested, strange to say, on the shallowest and poorest foundations. Small stones laid on loose gravel were all they had to rest upon, though if the builders had gone some 3 feet lower they would have touched the solid rock. The wretched construction of these piers and of the walls above the arches led to a careful examination of the two western piers, when it was ascertained that, though they had not been crushed and peeled like the others, they were in other respects little better than their eastern companions, as the following extract from Mr. Pearson's report thereon will show :—

"The openings I have had made into the piers by removing some of the facing stones show very conclusively that the construction of them is like that of the two others which have been taken down, and which consisted of a thin facing of stone for the outside facing without any bond, and within the casing the whole of these piers was filled in with small rubble stones and sandy earth. There was scarcely a stone in them larger than a man's hand, and mortar seemed not to have been used, except where some alterations had been made at a later date. It is quite impossible to conceive a worse piece of construction, and it is equally impossible to understand how it is that these piers have stood so long ; nothing but the power of the Barnack ragstone, out of which the thin outside casing is formed, to sustain the enormous weight, saved them from destruction. There are abundant evidences to show that these two western piers, like those taken down, have barely strength in them to keep up. I have, therefore, with much regret, come to the conclusion that on no account must any attempt be made to rebuild the tower on these piers."

The excavations which were made at the bases of these piers in order to test the state of their foundations led to a very interesting discovery. At the foot of the south-eastern pier were found the remains of a Saxon building, doubtless the church of the ancient monastery. First of all, there was laid open to the north of this pier in the nave a wall, or rather two walls, with a narrow space between them, running east and west. Beyond these to the north was evidently open ground, a short wall at right angles to the others coming there to an abrupt termination ;

whereas on the south side at a depth of some 6 feet below the level of the present cathedral, were traces of the plaster floor of the ancient building. This was again reached in the south aisle, and extends probably to a considerable distance west and south. In the south transept the floor can be followed eastward to a plaster seat placed at the extremity of the building against the external eastern wall. Here it is plain that the limit of the Saxon building eastward has been reached, because in the open surface beyond a large stone coffin is standing, obviously of much later date. How far the remains of this Saxon building extend, and whether the lines of walling indicate the existence of one or more than one building, it is at present impossible to determine. This can only be done when the pier standing upon it and the immense shoring and scaffolding necessary for its demolition have been removed.

No Saxon ornamental stonework has yet come to light in the western piers, but in the foundation or interior of the eastern pier a few fragments of Saxon moulded work were found, such as perforated slabs of windows, door-jambs, and lintels, and one very interesting and richly-carved fragment of a capital almost unquestionably Roman. This may have been brought from Castor ; but it is curious that no other fragment of Roman work has been discovered.

The estimated cost of the additional work rendered necessary by Mr. Pearson's last report recommending the taking down and reconstruction of the two western piers was 5,779*l*., and, in accordance with a resolution of the restoration committee made at their last meeting, on November 7, 1883, the contract has been altered so as to provide for this work.

## TRURO CATHEDRAL.

AN account of the progress of the work at Truro Cathedral has been given by Lord Mount Edgcumbe the chairman of the Building Committee, with the object of obtaining aid to save the necessity of having to place a temporary roof upon unfinished walls. His lordship says :—

The first division of the work undertaken by the committee, consisting of the choir (112 feet long and 70 feet high internally), with its side aisles and eastern transepts, the restored south aisle of the old church, and the narrow aisle which unites the new building to the old, is rapidly approaching completion. The timbers of the main roof are being fixed, and the money for the whole has been received or promised, amounting to about 54,000*l*., including nearly 12,000*l*. which had to be expended in the purchase of adjacent buildings.

It was originally thought that only this division could be erected in our time, but, for constructional reasons, it was found desirable to lay the foundations of the great transept and of the western piers of the central tower ; and when the present Archbishop of Canterbury quitted the diocese an earnest desire was manifested throughout the county to erect a further portion of the cathedral, in which he had taken such a deep interest, as a memorial of his episcopate. The sum of 6,700*l*. has been subscribed for this purpose, a sum sufficient to complete the south transept. This is being actively proceeded with, as well as the south porch and adjoining baptistery, both provided for by special funds ; one being the gift of Canon Philpotts, the other the memorial to Henry Martyn.

Few persons outside the diocese are probably aware of the energy with which the work, so far, has been carried on, or of the architectural beauty of the work itself. But it must be evident that the erection of the south transept, without the completion of at least the piers and arches of the central tower, would be of little advantage, and the committee are now most anxious to complete the north transept, and, if possible, the lantern of the main tower up to the ridge of the choir roof and the small clock tower, before closing the work of the present generation. For this and for internal fittings of the simplest kind a further sum of nearly 15,000*l*. is required. The young diocese has shown its deep interest in the work. It is not sparing itself and asking others to bear its burdens. But it will be remembered that it has had to look to voluntary gifts alone for everything connected with its establishment—for the endowment of the bishopric itself (with the exception of 800*l*. a year), and the provision of a residence for the bishop, as well as for the erection of the cathedral. All this has been to a great extent accomplished during a period of extreme industrial depression, and a large annual outlay will be ultimately required to provide for the permanent conduct of the services of the cathedral, which are at present kindly undertaken by the rector of St. Mary's with the help of the honorary cathedral officers.

The First Half-yearly Issue of the "Railway Companies' Directory," edited by Mr. Percy Lindley, giving the capital authorised, received, and expended, the revenue, dividends, mileage, with classified lists of the directors and officials of the railways of the United Kingdom, will be published next week.

## NOTES AND COMMENTS.

AN invitation has been sent from the Council of the Institute of Architects to all the members who have gained the PUGIN Studentship. It is proposed to bestow a medal in connection with the studentship, and it has been considered that the most fitting designer would be one of the successful competitors in a past time. So far the proposal is deserving of commendation. But if there be a medal, it should be of gold rather than of silver. The Institute funds are large enough to provide for the use of the more precious metal. It is also, we consider, bad policy to offer a prize of ten pounds for the best design. Many of the PUGIN students have attained position as Fellows in the profession, and they are more likely to compete for the love of the thing than for so paltry a sum. If the circular had requested a design from each of the PUGIN students, and if the selection of the one best adapted for reproduction had been assigned to the students themselves, instead of to the Council of the Institute, there would have been a heartier response than the prospect of receiving a cheque for ten pounds will ever invoke.

THE late Mr. JOHN HENRY PARKER was one of the most remarkable of English archaeologists. He was trained as a bookseller, but in his investigation of buildings he acted as if he were a mason. It was characteristic of his temperament when he set about investigating the masonry in the foundations of Roman walls and conduits—a class of work which men who were acquainted with building had neglected. Mr. PARKER was not much of a draughtsman, and he was more at his ease in treating of rough masonry than of delicate tracery and ornamentation. But his "Glossary" will be ever an invaluable work, if it were only for its illustrations of the best details of English Gothic. If Mr. PARKER had been trained as an architect his thoughts about building would have gained a coherence and unity which they did not possess. He could not write at much length on construction without losing the thread of the disquisition, and his books on Roman archaeology are a heap of facts in inextricable confusion. He was more competent for a work consisting of short articles like the "Glossary." Mr. PARKER was an enthusiast, and he did yeoman service to archaeology, but his career should be a warning to amateurs who attempt the treatment of practical subjects without practical knowledge.

IF Mr. WATTS, R.A., is able to have his group cast in bronze by May, the next exhibition of the Royal Academy will possess at least one great work in sculpture. The artist has already shown his skill in modelling a horse. In his new group Mr. WATTS represents one of the first trainers of a horse, and the rider is apparently delighted with his new powers. With one hand the man shades his eyes and looks into the distance as if he had found a means to overcome space and time; with the other hand he grasps the animal's mane. A man is never more manly than when he has mastered a horse, and Mr. WATTS has expressed the idea not only by the position of the rider but by the largeness of the style of treatment, which recalls the massiveness of ALCAMENES. The new group is a noble work of English art, and it is too important to be allowed to form part of a private collection.

MR. BOEHM's fine statue of Sir FRANCIS DRAKE on Plymouth Hoe is to be unveiled, with much naval and military display, on St. Valentine's day by Lady DRAKE, of Nutwell Court, and the historic town, of which Sir FRANCIS was mayor, will worthily celebrate the event. There is to be a banquet in the Guildhall, and an exhibition there of relics of the great circumnavigator, including his swords, cups, jewels, his chair (from Oxford) made from the ship in which he made his first voyage round the world, and one or two original portraits. A commanding site has been chosen for the statue, overlooking the green where the famous game of bowls was played when the Armada was announced to be in sight, and the Sound beyond. The statue is placed on a bold and handsome pedestal of granite, designed by MESSRS. HINE & ODGERS. The shaft is one large block of Peterhead red granite, and the steps, plinth, and cornice are of local grey granite. In excavating for a foundation some old Portuguese copper coins were found.

DAMAGE on a small scale was done to the cathedral at Carlisle during the late gales. Some ordinary glass windows were partially wrecked, lead was torn off the roof, and finials were broken off, besides the large cross over the entrance being carried away. Lovers of these old monuments of bygone art will not be sorry to learn that the wind further made short work of some stove-pipes of nineteenth-century work.

THE Municipal Casino at Nice was formally opened on Saturday last. It was commenced three years ago, and has, it is understood, cost 240,000*l*. The building is constructed on a long and solid bridge over the river Paillon, the dry and unwholesome bed of which will, when the whole scheme is completed, be almost hidden from view. A fine open space in front of the Casino, by which the Place Masséna is doubled in size, is not the least of the advantages conferred by the work on the town; and when the bridging process is still further continued by a garden which is to cover the Paillon along the length of the Quai Masséna, the already striking features of this central point of Nice will be greatly enhanced.

THE action for libel between Mr. GASTON L. FEUARDENT and General DI CESNOLA, referred to in these columns last week, has terminated in what is considered to be a victory for the General. The case, it will be remembered, arose out of a dispute as to the genuineness of General CESNOLA's Cypriote antiquities, which had been purchased by the Metropolitan Museum, New York, and the trial, which has just concluded in that city, has resulted in a verdict for the General upon two counts, and the disagreement of the jury on a third, which involved commercial matters in London, and constituted a technical issue altogether subsidiary to the main question.

AN interesting Art Exhibition is to be opened in Cardiff on the 14th inst. Unlike the majority of those which are held throughout the country, it will be independent of South Kensington. The aim of the promoters is to have an exhibition of local art, including portraits of celebrities and pictures from Welsh houses. The artists of Wales have responded to the invitation of the committee, and there will be an excellent collection of works in oils and water-colours, illustrative of Welsh scenery and Welsh life. The pictures are proof that there is a local school, and, in the course of a few years, we may expect to see Welsh art holding its own against Scottish art, especially in landscape painting. There will be a great many interesting works belonging to a past time. The Marquis of BUTE will lend several family portraits, and the committee could have had all the treasures belonging to Earl CAWDOR instead of a selection from them. But the desire of the committee has been to make modern art paramount, and antiquities like Hirle's Horn—which was a gift from HENRY VII.—or such things as the examples of Swansea and Nantgarw china are merely subsidiary to that end. The Cardiff architects, and especially Mr. SEWARD, have been working hard to secure success for the exhibition.

ACCORDING to the late Lord LYTTON, "the pen is mightier than the sword," and the opponents of the projected extension of the Skipton and North-Eastern Junction Railway would appear to consider it mightier than engineers, parliamentary agents, and counsel, when we see them going all the way to Florence to invoke the aid of "OUIDA's" pen against the line to Aysgarth Force. The place has been immortalised by TURNER; it is one of the wildest spots left in England, and the dalesmen of the neighbourhood would preserve it from the embankments and bridges of the modern contractor. "OUIDA" is as inimical to the railway engineer as Mr. RUSKIN himself, and according to the novelist every engineering work is accompanied by "havoc, dirt, smoke, and general ruin of grass and trees, of streams and atmosphere." There is some truth in the allegation, for railway engineers are not given to scruples about the inconvenience of their work to other people, although, according to Sir FREDK. BRAMWELL, the great failing of the profession is excessive modesty. Already railways have done irretrievable damage to English scenery, and, knowing this, would it not be well if henceforth all railway Bills were scrutinised by a special committee, whose office would be to preserve as much as possible of the picturesque in England?

## CONTINENTAL SKETCHES.

BY T. BUTLER WILSON

## ILLUSTRATIONS.

ST. PETER'S CHURCH, VERE STREET, OXFORD STREET.

THIS church, which was erected somewhere about the year 1730, was the work of JAMES GIBBS, the architect of St. Martin's-in-the-Fields and the Radcliffe Library at Oxford. Internally it is divided into nave and aisles by Corinthian columns and arches, with a recessed east end, very much after the manner of St. Martin's Church, although much smaller. Externally it is a very plain and somewhat dingy brick structure. It was filled with common deal high pews, with upright backs of a most uncomfortable description, when the present incumbent, the Rev. WILLIAM PAGE ROBERTS, M.A., came to the living. He determined that as soon as funds could be provided he would clear away the old fittings, which were quite unworthy of the church, and substitute open oak seating, with pulpit, &c., of a character in accordance with the architecture. This has now been carried out under the superintendence of Mr. JAMES KELLAWAY COLLING, F.R.I.B.A., and the result has been eminently successful.

As evidence of this, we now give a view of the new pulpit, lectern, and choir seats, which is a facsimile of Mr. COLLING's own drawing. The pulpit, which is hexagonal, is composed of niches, flanked by carved pilasters, supported on a pilastered pedestal. The carving is designed from natural foliage conventionalised. The niches are filled with figures of Our Lord, St. PETER, St. JOHN, St. PAUL, and St. MATTHEW, after those by THORWALDSEN in the church of Notre Dame at Copenhagen, these examples having been followed by the special wish of the incumbent.

The lectern, which is a very elegant and richly-carved work, was the gift of the Lady CAROLINE KERRISON. It consists of a triple arrangement of one round and two square columns, elaborately carved, from which springs a beautiful double scroll supporting the front of the book-board.

The choir seating has bench ends with bold open-carved scrolls of elegant design. The type of work adopted in the carving has been very much after the manner of the oak carvings of GRINLING GIBBONS, when carved out of the solid, and not afterwards applied, as was the case with so much of GIBBONS's work. In designing the carving Mr. COLLING has freely resorted to nature, which he has for so many years closely studied, but it has been rendered very skilfully with that conventional delicacy which is so characteristic of the best period of the Italian Renaissance.

The whole has been most faithfully executed, from full-size drawings made by the architect, by Messrs. CORNISH & GAYMER, of North Walsham, Norfolk, builders and architectural carvers, with the exception of the figures occupying the niches of the pulpit, which were the work of Mr. JAMES FORSYTH, sculptor.

The interior of the church was also decorated by Messrs. J. & J. KING, decorators, of Norwich, under the architect's superintendence. The east window, the gift of Lady DE BLAQUIERE, erected in memory of her husband, was executed by Messrs. MORRIS & Co., from the designs of Mr. BURNE JONES. This gentleman has also executed a painting of the *Entombment*, which fills the centre panel of the reredos. The flank windows of the church, which are filled with ornamental leaded and tinted glass, were executed by Messrs. PEPPER & Co., of the Euston Road, and the sunlights by Messrs. STRODE & Co. The organ was removed from the west gallery and re-erected at the east end, with considerable additions, by Messrs. HILL & SON, the organ builders.

ST. MARY'S CHURCH, HOPE-UNDER-DINMORE.

THIS church, which was altogether a modern building erected about fifty years ago, has lately been partly rebuilt, from the designs of Mr. F. R. KEMPSON, F.R.I.B.A., 7A Whitehall Yard, London, and Hereford. The nave, north porch, and transept are already finished. The tower will be cased with new stonework, and surmounted by a shingle spire. The chancel will be entirely rebuilt. The church consists of nave, 66 feet by 18 feet 6 inches; chancel, 28 feet by 16 feet; chancel aisle, 28 feet by 9 feet; transept, 19 feet by 18 feet. The contractor for the portion of the work already done was Mr. HENRY WELSH, of Hereford. The living is a rectory under the patronage of Mr. G. H. ARKWRIGHT, of Hampton Court, Leominster.

RESIDENCE AT SALE.

WE publish this week a view of a house at Sale, Cheshire, erected for Mr. JAMES H. LYNDE. The house stands well back from the road, and contains three entertaining-rooms and a study, seven bedrooms, &c. The entrance-hall is about 15 feet square; out of it runs the principal staircase. The whole house is cellared. Internally, stained pitch pine is used throughout; externally, the bands, sills, jambs, &c., are in terra-cotta. The roofs are tiled. There is stabling at the back for three horses. Messrs. WILSON, TOFT & HUNTLEY, builders, carried out the works, from the designs and under the superintendence of Mr. CHARLES HEATHCOTE, architect, Manchester.

ST. PETER'S CHURCH, PRESBYTERY AND SCHOOLS, SOUTH BANK, MIDDLESBROUGH, YORKS.

THE buildings, shown in our illustration, have recently been erected on the Middlesbrough Road, South Bank, a populous rising town near Middlesbrough, Yorkshire, for the Very Rev. Canon HOLLAND. The church consists of nave and sanctuary (already built), with south aisle and tower (not built). Extreme length 102 feet, width 38 feet, giving 544 sittings. Adjoining the church is the presbytery and sacristy, built of local red bricks and stone dressings. There is also a quantity of terra-cotta ornaments, manufactured by Mr. JABEZ THOMPSON, of Northwich, Cheshire; the stained glass over transom lights was supplied by Mr. KNOWLES, of York. The external walls are built hollow, 17 inches thick; and the floors are carried on fitch girders; the hall and passages are laid with MINTON tiles, and staircase landings with oak parquetry. The presbytery contains seventeen rooms and small conservatory.

On the opposite side of Middlesbrough Road are the schools, a plain substantial two-storey building for 350 children, the only attempt at ornament being a carved stone niche, with figure of *Madonna and Child*.

MESSRS. CRAGGS & BENSON, of Stockton-on-Tees, were the contractors; Mr. BULMER, of South Bank, acted as clerk of the works; and Mr. MARTIN CARR, of Middlesbrough, was the architect.

CONTINENTAL SKETCHES.

THESE sketches, with the exception of the Tower of St.-Gangolph, Trèves, are all taken from the old Flemish cities. The dormers are given as examples of that wealth of charming brickwork which lines and breaks up the façades of canal and street alike. The Early Renaissance dormer from Ypres is of stone. The Beffroi de Courtrai, which is in the Groote Markt, or Grande Place, opposite which the Town Hall rises, is of red brick mellowed with time, and forming a nice grouping amongst the surrounding buildings.

## THE ARCHITECTURAL ASSOCIATION.

THE sixth ordinary meeting of the Association was held on Friday evening, the 1st inst., Mr. Cole A. Adams, President, in the chair. A visit, it was announced, would take place on Saturday, the 9th inst. (to-day), to Harrington Gardens, new houses designed by Messrs. Ernest George & Peto. The death of Mr. John Henry Parker was announced.

Mr. JOHN D. CRACE then read a paper as follows:—

## On Colour Decoration.

In laying down rules for practical decoration, the subject must be divided under various heads. There are certainly rules which are generally applicable, but there are also those which must be applied under conditions of limitation. Among the latter must be classed those which concern the purpose of the room or building, the style of architecture employed, and the manner of lighting both by day and night.

Let us take first the rules of general application. Under this head may be ranked those which affect the expression of proportion and of form, and those which concern harmony of colouring.

That the proportions of any interior may be very largely affected by the scheme of decoration is, of course, very well known to you, as are also, no doubt, a few of the broader rules bearing on this axiom. It may also not have escaped your observation that they are constantly disregarded, even by architects, when they dabble in colours, who seem too often to be carried away by a love of some particular arrangement of wall surface; sometimes a wide frieze, at others a high dado being indispensable to their content,

whatever the height or size or style of the room. Now, I shall ask you to make it your fixed rule to begin by considering the size, proportion, and other conditions of your room, and then to determine whether it is desirable to express or add to its apparent height or its apparent width and size. You can, if necessary, considerably increase either, but not both. It will generally be found that, speaking broadly, what you add to one you take from the other. When this point has been decided you will find it a much easier matter to deal consistently with the arrangement or division of the surfaces presented to you. Observe, I by no means insist that a room must be made to look higher, but I do insist that you should know whether you intend it to look higher or not, and that your distribution of surface decoration should not be entirely regardless of proportion.

It is a very common fallacy that to colour a ceiling is to lower it. Still more often is this result expected if projecting ribs or mouldings be added to divide the blank surface. Yet it may easily be shown in argument, as it is constantly exemplified in practice, that the opposite effect is quite as often produced, colour being the determining agent. Let us assume the walls of a small private library, 12 feet high, to be hung with one of the embossed leather papers now in frequent use, the pattern brown and gold on perhaps a warm green ground; the bookcases below, of oak or walnut wood, with their contents, maintaining a quiet similarity of general tone. The cornice is, say, 9 inches deep. If you leave it a light tint and the ceiling plain, the room will appear quite 9 inches lower than it would were the cornice brown like the bookcases. And if this brown is continued on to the ceiling by means of wooden ribs, the room will gain at least another 6 inches in apparent height.

The fact is, that the point at which the attention is arrested by a marked contrast is that by which the eye assesses the height; and, since the mouldings of the cornice project inwards to the room, even more apparent height is gained (than is marked in vertical distance) when the contrast is placed high, since advantage is taken of an apparent perspective.

On the other hand, if it be desired for other reasons to retain the wooden ribs and cornice, yet not to add to the apparent height, a corrective is readily applied in colour, either in the form of a narrow frieze, of sufficiently emphatic contrast, below the cornice, or by contrasted relief of colour at the same point as the cornice itself. Even a line of gilding may suffice.

In the same way the influence of a wide frieze or a dado on the proportions of a room is largely controlled by the colouring. A wide frieze may be used of the same colouring, or even of the same depth of tone, as the wall below, without materially affecting the apparent height; but a very small amount of contrast in tone will be sure to tell in the case of a large plane surface. Hence, if a frieze with some contrast be used where height cannot be sacrificed, it is essential to place its brightest contrasts as high up and as near the cornice as possible, lest the eye be arrested at the bottom, and the frieze itself, together with the cornice, be relegated to the ceiling. Some rooms are high enough to bear this sacrifice of wall, in which case they largely gain in apparent width and space.

So much for the horizontal lines, which are the most important; but the vertical lines and the manner of dealing with them must not be forgotten. Perhaps, during the last few years, they have been rather unreasonably ignored. Of course "pilasters" are not always essential or desirable—in many rooms they are absolutely out of place—but your modern "art decorator" seems to have forgotten that such a feature is available anywhere; and your modern "lady of taste" hears you utter the word "pilaster" with the same suppressed emotion which she would exhibit if she heard a sailor swear—she only excuses it as "language belonging to the profession." My advice to you is by no means to discard so useful a means of expressing height or symmetrical arrangement. It is especially useful where you want the dignity of architectural expression in a limited space. In the case of a long unbroken wall pilasters are a useful means of preventing that apparent sagging of the cornice line which is apt to trouble the eye, and which the Greeks were so well aware of as to substitute a gentle curve for the weak horizontal line.

I must be understood, when speaking of "pilasters," to use the word in the decorative sense, not in the architectural. I do not necessarily mean a feature having capital and base. A narrow vertical panel, distinguished from the larger wall-spaces which it divides, is equally a "pilaster" to the decorator. If ornamented, its ornament must have a vertical direction.

There are in most rooms certain features which may be made to aid in the expression of proportion. Such are doors, windows, and chimney-breasts. In nine houses out of ten the dimensions of the door have no relation to those of the room. There are many ready methods of getting over this difficulty, such as the addition of door-head or frieze, with capping moulding; or, in some cases, continuing the framing of the door so as to enclose a panel above it, to be treated distinctly from the other wall-surface. Then, again, the windows may, by the arrangement and colouring of the draperies, be made to distinctly influence the proportion. And so with the chimney-breast, a marked feature in most ordinary dwelling rooms. A sense of size and importance may often be

given by treating the whole breast as a part of the fireplace arrangement, or, at any rate, as a distinct feature. Examples of the effect of such treatment will occur to you in several of the old public buildings of France or Flanders. You remember the magnificent one at Bruges; and this arrangement in various forms occurs constantly in the French palaces and châteaux from the Mediæval periods down to the expiration of the monarchy. In the elegant decorations of the Louis XVI. period, the full height of the wall above the chimney-piece is constantly associated with it in one group, and our own Elizabethan examples are so numerous as hardly to need mention.

I have dwelt thus on the question of proportion as influenced by the colouring and decorative features, because I see it so constantly disregarded, and it appears to me that it should be the decorator's first problem.

After all, it is the ceiling which is in most cases the decorator's great opportunity. Where it is already divided into panels or ornamented in relief his first consideration will be how to do it most justice—to express it in the best way, and to emphasise the right points. Apart from the actual harmony of colouring, the good management of light and dark tones is of the first importance; to give point without producing patches of colour, and obtain a sufficient uniformity of effect without tameness or monotony. It is astonishing how a ceiling may be lifted out of mere flatness by the judicious disposition of its leading lines. If these are rightly expressed, much may be forgiven in minor defects of ornament or colours. The ceilings of the great majority of our rooms are flat, owing to the exigencies of space, no less than to those of cost. Let us, therefore, consider what variety of effect is attainable with ceilings of flat construction.

In the first place, where a perfectly flat plane of plaster is presented, there are the alternatives of treating it with colours alone, or of previously subdividing it by mouldings or relief ornament. The latter treatment is the one which obviously recommends itself where there is not too close a limit of cost, and especially if the area of ceiling be large. It is, indeed, most difficult to treat satisfactorily, with colour alone, a large area of plain flat ceiling, and such treatment should really be limited to ceilings of small dimensions. I will return to this point. The methods of division are numerous enough, and the decorator will be guided by several considerations in deciding on which to adopt. The amount of relief must be determined, firstly, by the height and size of the room, especially by the height, but also by the depth and richness of the colouring intended for the walls. Here, again, comes in the question of the ultimate use of the room; for a light and gay colouring is not compatible with the use of heavy mouldings or deeply-recessed panels in the ceiling. This is one reason why the relief ornament of the ceiling should either be designed by the decorator or in co-operation with him. To be successful it must form a part of the colour scheme. The light and shade of the relief ornament and mouldings are a most important factor in any scheme of colouring.

Like the walls, a ceiling may be so divided and subdivided as to materially affect its apparent length and breadth, and upon the same general principles. This, whether with or without any relief of mouldings, but preferably by their aid. It has already been explained that height is to be given by attracting attention to some feature high up in the cornice; but you may go further, and place your decisive contrast in the margin of the ceiling itself. From this point you may, if the area of the ceiling be square or nearly so, either maintain a flat or horizontal effect, or you may impart to it an appearance of rising from wall to centre.

Where the intention is to maintain the effect of a horizontal ceiling, the principal lines, if firmly expressed, must be distributed with even impartiality over the surface in a design consisting of a repetition of geometric form, or of forms having the appearance of repetition, or monotonous in their degree of relief. Or, again, very marked straight lines, taken from cornice to cornice across the ceiling, will emphasise the horizontal sufficiently. Examples of these are among the illustrations on the wall.

When, on the contrary, it is wished to raise your ceiling in the centre, it will be necessary to take care that your main lines are clearly marked by vigour of relief or of colour contrast, and that their arrangement expresses a growth from sides to centre. Your colouring must be so adjusted as to keep, firstly, the sharpest contrasts to aid in expressing their growth; secondly, the weight of colour gravitating towards the angles. In like manner the ornamentation, whether in colour or relief, should be made to assist in the effect of growth towards the centre—in fact, to flow with the same motive or tendency as it should have were the ceiling actually concave.

It may be useful here to lay down an axiom in reference to moulded ceilings. It is this:—"For light tints of colour, and with bright, gay tones, the relief of moulded surface should be very moderate. Strong relief of moulded surface is compatible with the use of powerful colour in masses, and with dark low tones." It may, moreover, be taken as a general rule for any situation that "strong shadows are incompatible with the use of light tints."

What I have already said as to moulded ceilings applies almost entirely to the distribution and character of the dividing main lines. The ornamentation of the intervening spaces may be left

almost untrammelled by rules, if it but retain a subordinate position, except only where special accentuation of the general design is required.

Now, providing that the surfaces be not too large, precisely the same general rules will apply to the decoration in colour only of plane flat ceilings, without the aid of relief. Lines of expression must be used of colour so firm as to lead the eye with decision, and to take the place of the mouldings whose direction we have been considering. The emphasis yielded by light and light and shade being lost, the whole treatment must be lighter and simpler. A subdivision into monotonous repetitions of form is rarely pleasing in colour only. A greater freedom is, for the most part, desirable. Once the spectator is aware that it is by the brush alone that the surface has been treated, he expects, to some extent, the freedom of hand that the brush suggests. You find this admirably exemplified in the Greek work of Pompeii, and no less in many of the best works of the Renaissance. This freedom applies perhaps more to the treatment of ceilings than of walls; but in a less degree it applies to walls also, if other conditions do not impose some severity of treatment.

It will, as a rule, be found that where a flat ceiling has to be treated in colour only, without any aid of mouldings, it is desirable to maintain white as the ground, or, at any rate, to retain a great deal of white, for without white it is difficult to indicate with sufficient clearness the main lines as distinct from those which have no more serious purpose than ornamentation, that is to say, to distinguish the lines which affect proportion from those which are a part of the detail. This rule does not apply with the same force on curved surfaces, where less artificial suggestion of form is demanded, and where, moreover, gold can be used much more freely should the circumstances admit of it.

(To be continued.)

## THE SANITATION AND RECONSTRUCTION OF LONDON.

AT the meeting of the Society of Arts on Wednesday evening, Sir F. Abel in the chair, Mr. William Westgarth gave a lecture on the "Sanitation and Reconstruction of Central London," with suggestions on the rehousing of the poor. The chairman spoke of the great interest which had been taken in the subject, and the amount of consideration and study which it had received from Mr. Westgarth, who had offered prizes to the amount of 1,200*l.* for essays. Mr. Westgarth began by referring to the attention which had of late been directed to the insanitary condition of the dwellings of the poorer classes of London, remarking that a larger, and a not less pressing, question was the sanitation, the street re-alignment, and the reconstruction of central London, for much larger interests were at stake in it. The rapid growth of London, which was the feature of the century, was much more in the later than in the earlier section of the century. The law of modern progress, exemplified by London, at least, appeared to be geometrical, and not merely arithmetical. The advance of the last ten years seemed to be always greater, actually and relatively, than that of any previous like interval. The difficulty of dealing with the evils of packed central London had, the lecturer remarked, lain in the question of the best kind of agency for grappling with them, but he maintained that it could be undertaken in an ordinary business way, and so as to prove self-remunerative, while the expropriations and other social or business disturbances of such a vast undertaking could be minimised to a great extent. He referred to the irregularity of the plan of central London, and said there was no difficulty in guessing how old London had come down to the present population so oddly parcelled out. There was first a devious pathway through the fields, which broadened into a road, with dwellings and gardens on either side. Then it became a thoroughfare or main street, and eventually it was surrounded by modern streets and squares. As to the insanitary condition of the houses which had thus arisen, Mr. Westgarth remarked that only a few who had given an intelligent attention to the subject could fully realise the terrible condition of London in this respect; to all others it was an unknown and incredible quantity. In speaking upon London as it ought to be he suggested two chief centres, the lesser of the two, comprising the site of St. Paul's, he would distinguish as the art centre; the greater being that great centre of the world's commerce and finance, which was now indicated as the fertile site of the Royal Exchange and Stock Exchange, of Lloyd's, of the Bank of England, other chief banks, and "Lombard Street," of the Mansion House, and of the City branch of the General Post Office. From these centres, but especially from the latter, should radiate all the chief thoroughfares of great London. After detailing the arrangement which might be made for the conduct of business and the centralisation of public offices, he said that as they indulged in the reconstruction in ideas of unprecedented width of streets, they might recompense the sacrifice of accommodation in one direction by seizing upon more of them in another—by giving

greater height to the new buildings. There was plenty of room both "towards heaven above and in the earth beneath," and he thought, in the first instance, they should eject all the old poisoned soil, and, in so doing, institute a new level of construction. An ample subterranean area would give at once business storage and the due facility for availing of all the progress of art and science in the future, in lighting, watering, sewerage, and the application of energy or power in all ways without the heretofore incessant breaking up, over and over again, of the streets. Next they would have a lofty ground floor—so lofty as to allow, without serious reduction of light to that floor, a terrace or upper promenade, with bridged connections for foot passengers, so as to put an end to those countless street dangers and accidents which already cost to London and its suburbs the yearly sacrifice of 270 lives. This level, as well as that of the ground, would have its shops and traffic to swell out a remunerative rent-roll. Continuing in the ascent through successive floors of offices or dwellings, until the public lift land, without fatigue, upon the roof. This was something entirely new to London experience, and possibly to any other as yet, but entirely attainable under a systematic reconstruction. In short, the roofage of the chief streets would be a public promenade, a continuous park or garden.

## LYCIAN ART.

IN the fifth lecture on Lycian art delivered at University College, Professor Newton first described the great tomb in the Lycian Room of the British Museum, which is commonly known as the Chimæra Tomb, because on both sides of the roof is a relief representing Bellerophon slaying the Chimæra. The myth of Bellerophon was a favourite subject in ancient art, and we have many representations of it on vases, sculptures, and coins. A good list of these is to be found in a memoir by Engelmann in the *Annali* of the Roman Institute for 1874. Bellerophon was a descendant of the Corinthian Sisyphos, and fled from Corinth to Argos on account of an unintentional homicide. Proitos, king of Argos, received the fugitive, but afterwards, through unfounded jealousy on account of his wife Anteia, sent him to his kinsman Iobates, king of Lycia, with secret instructions to put him to death. Iobates, instead of carrying out this instruction, sent Bellerophon on three dangerous missions, first to slay the Chimæra; then to subdue the Solymi, a people of Semitic race dwelling in the mountains on the eastern frontier of Lycia; and lastly, to attack the Amazons. Bellerophon coming back victorious from these dangers married the daughter of Iobates, and succeeded him on the throne of Lycia. He was in after times pre-eminently the national hero of Lycia, and we find on Lycian tombs two other representations of his slaying the Chimæra. That fabulous monster was composed of a lion, out of whose back grew a goat's head, with a serpent as a tail; flame issued from its mouth. According to ancient authors under this strange form was typified a mountain east of the Solymi, out of which issued a perpetual flame. The spot where this phenomenon existed is accurately marked by the geographer Scylax, who says that it was on a mountain overlooking the port Sideros on the eastern coast of the Lycian peninsula. A temple of Hephaistos stood here. Following the indications given by Scylax, Sir F. Beaufort, who surveyed the Lycian coast at the beginning of this century, had no difficulty in discovering this perpetual fire at a place called Yanar by the Turks. In his "Coramania" Beaufort describes this fire as a stream of gas issuing from a cleft in the rock, which produces very little smoke, and of which the heat has little effect on the vegetation around. The Turks use the soot from it as a remedy for diseases of the eyes. This spot was afterwards visited by Spratt and Forbes and also by Mr. Albert Berg, a German artist, who was sent by the King of Prussia in 1854 to explore Lycia, and who has contributed a short memoir on the Yanar, with a sketch of the rock from which the gas issued, in the *Zeitschrift für allgemeine Erdkunde*, Berlin, 1854. Forbes states that at the place where the gas issues forth limestone and plutonian serpentine are in close contact. The lecturer then described the sculptures of tombs in several other Lycian cities, casts of which were taken in the course of Sir C. Fellows's expedition. At Myra is a tomb of which the front is an imitation of the kind of wooden structure which Fellows compared to the square-headed windows of Elizabethan architecture. The interior is composed of an inner chamber in which the interment took place, and a portico or ante-chamber, on the sides of which and on the rock outside were figures, male and female, larger than life. These were all originally coloured, as may be seen by reference to the plates in Fellows's "Lycia." They are also engraved in Texier's "Asie Mineure." The lecturer then noticed the sculptures on tombs at Tlos, Pinara, and Cadyanda. The reliefs on all these tombs contained a combination of battle scenes with domestic and peaceful scenes. On a tomb at Cadyanda was sculptured a family group; the composition, as drawn by Mr. G. Scharf, as the frontispiece of Fellows's "Lycia," was of singular beauty, but the cast of this group in the Lycian Room at the Museum does not convey the same impression of refined sculpture.

## DRAWINGS OF THE TWEED.

THE Royal Association for the Promotion of the Fine Arts in Scotland, which since 1833 has expended 200,000*l.* in furtherance of the objects it has in view, has resolved to celebrate the fiftieth anniversary of its foundation by the publication of a subscription work of more than common importance—a series of engravings of “The Tweed, from Source to Sea,” after drawings by Mr. G. Reid, R.S.A. During the past summer this artist has visited the locality on two separate occasions. Residing at the various little country inns which border at intervals this historic stream, he has executed an extensive series of large pencil sketches, each taken on the spot which it depicts. Sixteen of the most striking of these subjects have been selected as the illustrations of the forthcoming volume, and the renderings of Mr. Reid’s pen-drawings are to be reproduced direct by M. Amand Durand, of Paris. Three of the plates have already been engraved. In the first are seen the small beginnings of the stream amid the loneliness of the hills at Tweed’s Well; in another is the Bridge of Kelso mirrored in the calm of the river; while the third shows a terraced foreground which overlooks the venerable Gothic pile of Melrose. The other subjects are to include, among the rest, Tweedsmuir with its church, the Vale of Tweed-Boughton, Neidpath Castle, Ashestiel, Smailholm, Norham, and, finally, a view of the river’s ending as it seeks the sea beneath the walls of Berwick. The letterpress of the volume has been entrusted to Professor Veitch, of Glasgow, and each illustration is to be inscribed with a few lines, marking the associations of the place, from the old songs and ballads by which the nameless minstrels of the district have linked the scenes to memories of human deeds and human sorrows.

## THE SIMPLON TUNNEL.

THE following details of the proposed Simplon Railway are taken from a description furnished by a correspondent at Geneva. It is one of two schemes involving a sub-Alpine tunnel, the rival scheme being one for piercing Mont Blanc. Railway lines both on the north and south sides of the Simplon are already completed. The tunnel which it is proposed to pierce through the Simplon will be not far short of eighteen miles in length, and consequently the longest tunnel in the world.

The first practical steps towards the commencement of the work may be said to have been taken during the winter of 1876–77, when experiments were carried out with a view of determining, both on the Swiss and Italian side, the amount of hydraulic force that would be available for the boring-machines as well as for purposes of ventilation. On the Swiss side this force will be derived from the waters of the Rhone, and on the Italian side from the Diveria. These experiments, which were continued in 1882, tended to prove that even in the depth of winter, when the motive power is at its lowest, the engineers will have at their disposal at each end of the works hydraulic forces equal to about 6,000 effective horse-power. It is calculated that this force will not only enable them to pierce rapidly, but that an efficient system of ventilation can be maintained. On account of the great length of the tunnel this question of ventilation is one of importance.

At 6,500 metres from the north head of the tunnel a shaft will be sunk about 1,000 metres in depth, and sloped at an incline of about 45 degrees. At 5,300 metres from the south end a similar shaft will be sunk, having a depth of 680 metres. The bottoms of these two shafts will be connected by a vaulted gallery several metres above the line of advancement of the tunnel. As the work of boring proceeds an opening will be effected between the tunnel and the gallery, and consequently there will be a direct communication with the outer air. As the workmen cut their way further into the earth, a new opening into the gallery will be made over them, and the one behind will be closed. The men will thus always have over their heads a shaft through which the foul and poisonous gases will escape. As it frequently happens, however, especially in the high Alps, that under certain atmospheric conditions, the upper air becomes so dense that the gases from the earth do not rise quickly, it will be necessary to have at the head of each shaft a mechanical arrangement which may be described as a series of gigantic suckers. These suckers will be constantly at work drawing up the foul air, while from the openings at each end of the tunnel hydraulic power will ceaselessly pump in fresh air. By this system it is expected that the temperature will be kept down to a fixed point, and a comparative state of atmospheric purity maintained. Should it be found on application that the arrangement described is insufficient to obtain the desired object, the temperature will be lowered by running streams of iced water, and large quantities of quicklime will be introduced into the tunnel to absorb the humidity of the air. It is also decided that the electric light shall not only be used for all purposes of illumination, but that the locomotives necessary for drawing the waggon loads of *débris* shall derive their motive power either from compressed air or electricity.

To obtain the easiest declivities on the Italian side, where

there is a great fall, the south end of the tunnel will debouch at the lowest altitude possible. Consequently there will be a very steep incline from the centre of the tunnel towards the south. The north end will debouch in the alluvial plain formed by the deposits of the Rhone, exactly opposite the little village of Masseggen, and at an altitude of 689 metres above the sea. This end will be about an eighth of a mile from the present station of Brigue. Subject to variations in the plans which further study and surveys may suggest as being advisable, the following is a description of the line as planned by M. Meyer, chief engineer of the company. Leaving Brigue, it will pass through a short tunnel and rise to the entrance of the great tunnel, which, as already stated, will be opposite the village of Masseggen. At 6,000 metres from the entrance it will pass under the valley of the Gauthier, near Berisal, the pleasant little village so well known to summer tourists who cross the Simplon. This same valley of the Gauthier bears a very evil reputation for avalanches. The train, however, will have nothing to fear from avalanches, as it will, at this point, be 700 metres, not far short of half a mile, below the surface of the earth. Near the culminating rise in the tunnel, and when some distance to the north-east of the position of the Hospice, the frontier between Italy and Switzerland will be crossed. And here the traveller will have above his head the mighty mass of Monte Leone, 11,696 feet, with its glaciers, one of which is pierced by a gallery at the present day, to allow the road to pass. From the culmination there will be a long run, all down hill, to the south opening, above the village of Iselle. From the south end of the tunnel to where the line will join the Italian railways, there will be thirty-five tunnels, having a total length of 9,667 metres, or a little over 30 per cent. of the entire length of the line. The shortest of these tunnels will be 40 metres, and the longest 2 kilometres 40 metres. Several of them will be simply galleries cut through projecting rocks. There will be twenty-three viaducts measuring in the aggregate 1,423 metres, or nearly 5 per cent. of the total length of the line. The length of these viaducts vary from 23 metres to 136 metres. There will be twenty-four signalling stations placed at intervals of about 1,300 metres, and numerous passenger stations at short intervals. From Domo d’Ossola the line will run due south as far as Piedimulera. It will then turn east to Pallanza, on the north-west elbow of Lake Maggiore. Thence it will skirt the lake to Arona, where it will connect with the Italian lines.

## BRISTOL JUNIOR ARCHITECTS’ SOCIETY.

THE annual dinner of the Bristol Junior Architects’ Society was held on Tuesday evening. Mr. J. C. Moncrieff, vice-president, presided in the absence of Mr. C. F. Hansom, and among those present were Messrs. F. B. Bond, R. C. Sconce, W. G. Hill, J. M. Froud, E. C. Howell, G. G. Macpherson, R. Cridland, G. E. Ford (hon. sec.), &c. The usual loyal toasts having been proposed, Mr. Macpherson gave “The health of the President of the Society, Mr. Hansom,” which was responded to by Mr. Ford. Mr. Hill, submitting the toast of “The Junior Architects’ Society,” expressed a hope that the society, which was established in 1881, would continue to prosper in its career of usefulness. Mr. Froud responded. Mr. Ford proposed “The Vice-Presidents,” coupling with the toast the name of Mr. Moncrieff. In replying to that toast Mr. Moncrieff expressed a hope that jealousy would be lost sight of in connection with the society, and that their association would join the junior members together, so that they would all work harmoniously. In their society they had draughtsmen whose work could not be surpassed in any London office, and papers had been written by their members, which had been most favourably criticised by the architectural journals. Referring to the Omnibus Bill of the Bristol Corporation, the speaker said one clause in it would prove extremely useful if adopted—that which bore upon the class of material used in the erection of buildings.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this society was held on Wednesday evening, Mr. John McLachlan, past President, in the chair. Mr. Thomas Hume, of Messrs. Morrison & Hume, Edinburgh and Lasswade, read a paper entitled “Practical Plumbing,” in the course of which he pointed out that the plumber’s trade had undergone great changes during the last thirty years. Lead, which was the material almost exclusively used by the plumber at that time, has been largely supplanted by zinc, iron, and copper, and the diverse natures of these metals has tended to produce deterioration in the quality of the workmanship. It was shown that there are many scientific questions involved in the execution of plumber-work, and this great fact renders it specially essential that the plumber, to be an intelligent workman, should have a technical education, and this, fortunately, may easily be obtained. The limited time at the disposal of the lecturer permitted of his merely

touching in a cursory manner a few of the more salient points connected with the trade, such as on those forces which tend to produce decay, as also on those things likely to secure the most perfect work. The lecture was divided into three heads, viz.:—I. Roof or outside plumber-work; II. Inside plumber-work for storage and supply of pure water; III. Plumber-work for conveyance and removal of sewage and foul water. Models and diagrams were produced illustrating the different kinds of work, and more particularly the principle and arrangement of hot-water apparatus, the efficiency and ventilation of soil-pipes and waste-pipes, and the best forms of water-closets, flushing apparatus, and other fittings. At the conclusion a cordial vote of thanks was accorded Mr. Hume.

### FEMALE SCHOOL OF ART, BLOOMSBURY.

THE medals and prizes were distributed to the pupils of this school, on Wednesday evening, by the Countess Granville. The report, read by the honorary secretary, Mr. Francis Bennoch, stated that a pupil of the school had again won a national gold medal, and that others of them had gained two national silver medals, five national bronze medals, and seven national Queen's prizes. These honours had been won in competition with 164 schools of art, from which 926 works were accepted for the national competition. These 15 awards were obtained by 14 students, as compared with 11 awards gained under similar conditions by 10 students last year. The records of successes for the 18 years 1866-83 showed that the national awards to this school included seven gold medals, 25 silver medals, 43 bronze medals, and 66 Queen's prizes. During the past year 192 students had received instruction in the school, and on April 9 2,022 drawings, paintings, and three models were forwarded to South Kensington. These were the work of 129 students—an average of ten works for each. With regard to former students, the committee were able to give an excellent report of those who had joined the chromolithographic studio, which was successfully started in connection with this school in February last by Sir Philip Cunliffe-Owen. The director, M. Faustin, reported that these students excelled in truthfulness of drawing and delicacy of treatment of natural flowers, foliage, and landscape; that they had shown special aptitude for the work, and in three months had overcome technical difficulties which ordinary apprentices would take two or three years to master. Before the proceedings terminated a resolution was passed to take steps to purchase the adjoining premises, for the extension of the school, which had become necessary.

### THE NATIONAL ASSOCIATION OF MASTER BUILDERS.

ON Wednesday, January 30, at the Alexandra Hotel, Bradford, there was held the first meeting in that town of the National Association of Master Builders of Great Britain. After the report and accounts had been passed, a discussion arose with regard to forms of contract and tenders, and the mode of making out quantities; and it was decided to appoint a sub-committee to confer with the committee of the Royal Institute of British Architects upon the point. Mr. Stanley Bird, of London, was re-elected president of the association for the forthcoming year; Mr. Cowlin, of Bristol, and Mr. Neill were re-elected vice-presidents; and Mr. J. C. White, of Liverpool, treasurer.

In the evening the Bradford Master Builders' Association entertained the delegates to dinner at the Alexandra Hotel, more than eighty persons being present, and Mr. John Beanland, of Bradford, presiding.

After dinner the customary loyal toasts were drunk, and the chairman proposed the "National Association of Master Builders." He said that the association began its existence at Birmingham, and had gradually increased in importance. He hoped that the representatives of the association, which met in Bradford for the first time under its present name, would go away satisfied with the Bradford builders, and that the local association would be convinced that there were advantages to be derived from joining the general one which could not be gained in any other way.

Mr. Stanley Bird responded on behalf of the association, and said that it was principally through the efforts of Mr. Beanland that the National Association had its birth. He also referred to the advantages to be derived from the connection of a local organisation with the National Association, and pointed out that after its formation, and in his opinion to a great extent as a result of that, there had been no serious and general strikes in the trade. They were now frequently able to talk over grievances with the men, and, by reason of their combination, to settle differences in an amicable way. That was very much better than the protracted strikes which they had had in the past, and which brought nothing but misery and ruin to all concerned. After commenting upon the change in the attitude of the architects towards builders, he

concluded by advising them to be always ready by means of thorough organisation, so that if the necessity came they could meet either the men or the architects.

Mr. Colls, of London, proposed "The Town and Trade of Bradford."

Mr. Wm. Moulson, alderman, responded. He said he thought there was not another town in England which had seen so great a transformation as Bradford had in the course of the last twenty years. He remembered when there was a foundry with all its smoke right in the midst of the town. To the National Association was owing the increased respect with which builders in Bradford and elsewhere were treated by the general public and also by architects. They did not, he said, want to press the workmen; they should be pleased if trade were to become so good as to warrant the employers in granting an advance of wages, and at this time he must say there was every prospect of a better building trade. It had been bad enough for the last six or seven years, as they could all bear testimony to; but matters were looking brighter in Bradford for both employers and employed. In conclusion, he urged the necessity for the union which would be brought about by the local societies joining the National Association.

### SOCIETY OF ENGINEERS.

THE first ordinary meeting for the present year of the members of the Society of Engineers was held on Monday last, at the Town Hall, Westminster.

The statement of accounts for 1883 was read, after which the President for the past year, Mr. Jabez Church, M.Inst. C.E., F.G.S., &c., presented the premiums of books awarded for papers read during that year. These were to Mr. George Bower, for his paper on "The Bower-Barff Process of Preserving and Ornamenting Iron and Steel Surfaces"; to Mr. Chris. Anderson, for his paper on "The Feasibility and Construction of Deep-sea Lighthouses"; and to Mr. Hamilton W. Pendred, for his paper on "Designs, Specifications, and Inspection of Ironwork."

Mr. Church announced that Lady Siemens had kindly presented to the Society seventy volumes on engineering subjects from the library of her late husband, Sir William Siemens, in remembrance of his long connection with the Society of Engineers. Mr. Arthur Rigg, the new President for 1884, then delivered his inaugural address.

After referring to the work of the past session, and stating that the short educational courses of lectures commenced during the last President's term of office showed the interest taken by the Society in the education of engineers, the speaker referred to the extended cosmopolitan characteristics of engineering at the present time, showing that it now embraced subjects very widely separated, and then went on to trace the progress of engineering education in England from the great movement in Lancashire in 1839, which resulted in the establishment at Chester (under the late Rev. Arthur Rigg) of what developed into the first engineering school in England. He also showed that the superior technical training of Continental schools had influenced the English system, and that now the City Guilds were as concerned to make trade secrets generally known as their predecessors were concerned to keep them in the knowledge of few.

### PEABODY MODEL DWELLINGS.

THE annual report of the Peabody trustees states that the net gain of the year, from rents and interest, has been 25,252*l.* 16*s.* 2*d.* The sum given and bequeathed by Mr. Peabody was, in 1862, 150,000*l.*; in 1866, 100,000*l.*; in 1868, 100,000*l.*; and in 1873, 150,000*l.*; making a total of 500,000*l.*; to which has been added money received for rent and interest, 329,863*l.* 15*s.* 8*d.*, making the total fund at the end of last year 829,863*l.* 15*s.* 8*d.* In addition to this the capital account has been increased by 390,000*l.* borrowed from the Public Works Loan Commissioners and others, of which sum there remains unpaid 361,333*l.* 6*s.* 8*d.*, thus bringing up the total capital to 1,191,197*l.* 2*s.* 4*d.* Since their last report the trustees have expended on land and buildings 119,382*l.* 18*s.* 5*d.*, making the total expenditure 1,089,883*l.* 12*s.* 6*d.* During the past year the trustees have opened thirty-three blocks of buildings at Whitecross Street, St. Luke's, containing 1,878 rooms, all of which are occupied. Eleven blocks, to contain 514 rooms, are in course of erection at Pear Tree Court, Clerkenwell—the last of the six sites bought of the Metropolitan Board of Works. The trustees will commence at an early date the erection of eight blocks of buildings in Little Coram Street to contain 420 rooms. They will also, during the present year, build three blocks at Great Peter Street, Westminster, and begin four blocks on a plot recently purchased adjoining their buildings at Islington. At the end of last year they had provided 9,693 rooms, exclusive of bath-rooms, laundries, and wash-houses. These rooms comprise 4,359 separate dwellings, occupied by 18,009 persons. The average weekly earn-

ings of the head of each family in residence at the close of the year was 1*l.* 3*s.* 8*d.* The average rent of each dwelling was 4*s.* 8½*d.*, and of each room 2*s.* 1½*d.*, the rent in all cases including the free use of water, laundries, sculleries, and bath-rooms.

### THE FALL OF A CHIMNEY.

**D**URING one of the late gales the chimney of the Elton Vale Bleachworks, Bury, fell and caused the death of three of the employés. The inquest was adjourned to allow a professional inspection of the works. During the gale a violent gust of wind came, struck the chimney, and caused it to rock. Immediately afterwards a second gust caught it, and broke off about fifteen yards of the top of the chimney. This portion fell on to the room where the deceased were, and wrecked the building. It is stated that about twelve years ago the chimney was raised about ten yards until it was thirty-five yards high, and twelve months since was straightened by a man named Williams, who took out a course of bricks on one side, and then strengthened the chimney by placing iron bands at intervals round the structure. Mr. James Maxwell, architect, of Bury and Manchester, after making his inspection, has reported that a contract had been entered into for a new chimney, and that the work was to have been commenced on the day of the accident. The base of the chimney was defective, not only in area, but in the construction and strength of the walls, the size of the base being utterly inadequate for the height of the superstructure. The adding to the top was the primary cause of the accident, but the fact that it had stood for twelve years proved that it had had greater stability than he could have expected. From his inspection of the *débris* he came to the conclusion that the walls had not been constructed in a workmanlike manner, but that in ordinary weather the chimney might have stood for some time.

### Pugin's Gateway at Oxford.

SIR,—I see in your paper of January 26, under the title of "Oxford, by a Correspondent," it is stated that it is proposed to remove the "present handsome archway" built by Pugin in 1844. I have seen the gateway myself several times, and have shown it to my friends who admire English Mediæval work, and they, with many others, look upon it as a splendid revival and beautifully in keeping with that noble college which Pugin so much admired.

If this gateway is touched it will be a lasting disgrace to those that are the cause of it. It also states that it is going to be re-erected in an unmeaning place—that is, a gateway that leads to nowhere—the principle of which Pugin so much abominated; and to think of removing any such work in 1884, especially the work of that great architect, will be a piece of the greatest vandalism that was ever known.

We cannot for a moment suppose that Messrs. Bodley & Garner, whose taste is evidently so similar to that of Pugin, are responsible for the proposed demolition.

Perhaps your correspondent can give us some information as to the reason, if there be any, for such wanton destruction; for whoever may be the cause, he must hold the memory of the respected Pugin but lightly.

I am, yours respectfully,  
EDWARD SUTTON.

Nottingham: January 31, 1884.

### Traffic Facilities in the City.

SIR,—The question of providing increased traffic facilities in the centre of the City of London is now under consideration by the Commissioners of Sewers, and a decision is to be made between the claims of the completion of the widening the neck of Fenchurch Street and making an opening from Thames Street to the Monument, and it is important that the public should clearly understand the merits of the case.

On January 17, 1878, Colonel Fraser, C.B., reported to the Corporation on "Vehicular Traffic," "the still existing necessity for increasing the width of portions of Great Tower Street, Lower Thames Street, and more particularly the western end of Fenchurch Street as far as Lime Street." The *Times* caps this seven days later with:—"Pavements are crowded to such an excess all through the busy period of the day that foot passengers are jostled, delayed, and worried in their attempts to move at a reasonable pace."

The commerce of Mincing Lane and Mark Lane has increased.

The foot traffic alone between the corn, wine, tea, sugar, tobacco, and general produce markets, and the banks and money markets, is much greater, and the obstruction proportionably worse.

The interchange between goods and cash is not in the least relieved by Eastcheap. The conduct of this commerce will not travel round the whole length of King William Street, nor will the road traffic with the East India Docks and the north bank of the Thames ascend and descend the Minories to Tower Hill.

The urgent necessity of opening the central thoroughfare on the north bank has been long admitted by the Corporation, and six times have they put patches upon the width, making the pressure upon the point named by Colonel Fraser worse. About 120 feet frontages, on one side only, require to be set back to render effective the bits of widening began some forty years ago at Aldgate Pump.

At the end of seven years since the representations quoted were made, and a memorial from these markets was presented to the Corporation; this crying need is threatened to be again indefinitely postponed for priority to a cart-stand for Billingsgate. Who is to receive the 326,000*l.* for 150 feet of back slums behind the Monument, and whose remaining property is to be enormously increased in value, does not at present appear, although three things are pretty plain.

It is not proposed that those who pocket and profit should pay anything.

If this—for which the amount is not yet definitely voted—takes precedence, it inevitably follows that no money will be found at present for Fenchurch Street.

If schemes involving powerful pecuniary interests are preferred to the most necessary improvement of a great thoroughfare, Mr. J. B. Firth, LL.B., M.P., has made no such serious reflection upon the Corporation as these would fix upon their proceedings.

I remain, sir, your obedient servant,  
39 Mincing Lane: R. M. HOLBORN.  
Feb. 4.

### The Warming of Fulham Infirmary.

SIR,—I read your notice in *The Architect* of the 26th ult. on the warming and ventilating of Fulham Infirmary. The notice being misleading, I write to deny the assertion that the best stove that could be found is supplied for the warming and ventilating the buildings referred to.

The Manchester stove was objected to because the down draught smoke-pipe was not concealed. The Galton stove has not more than one-half the warm air generating power that the Manchester stove has, but it was preferred.

It was notorious with the Galton grate at the Smoke Abatement Exhibition, 1881-82, that when fire was put into it it filled the corridor, where it was fitted up for inspection, with smoke to such an extent that its use was discontinued; and there it stood, a dummy, without any fire in it for about six weeks to my knowledge, and yet this stove or grate, in the report of the Smoke Abatement Exhibition, is spoken of as being the one that should have been tested in the testing room, and set up as a standard of excellence for all other grates to be measured by. Now, sir, are the stoves fitted up at the Fulham Infirmary of the same excellence as the grate shown at the International Smoke Abatement Exhibition? I believe they are. I feel sure that you will grant me the privilege of allowing this to appear in your next issue, and am, sir,

Yours faithfully,  
G. S. SHORLAND,  
Patentee of the Manchester Stove.  
Wilmington Terrace, Brook's Bar, Manchester.  
February 1, 1884.

P.S.—The smoke-pipe in the Manchester stove is now concealed or otherwise as desired.

### ART WORKMANSHIP.

**Stained Glass for Canada.**—We understand that Kingston Cathedral, Canada, containing upwards of one hundred lancet windows, is to be entirely filled with English stained glass during the present year. The designs of Messrs. Wailes & Strang, of Newcastle-on-Tyne, have received the approval of the authorities, and they have been commissioned to execute the whole of the work. The same firm have also in progress an "Acts of Mercy" window to commemorate the philanthropist, Thomas Moore, in his native place, Bolton, Cumberland; and they have just erected a handsome window and memorial brass, at Naples, to the late Charles Ernest Barff, son of the British chaplain, who lost his life by the earthquake at Ischia.

**Hothorpe Hall, Rugby,** the seat of Sir Humphrey de Trafford, Bart., has been supplied by Messrs. Jones & Willis, of Birmingham, with handsome entrance gates and railing of wrought iron. The work has been executed under the superintendence of the architect. Mr. J. Bowden, Manchester.

## WORKS IN PROGRESS.

**Messrs. Hawes & Co.**, of Bloomsbury Court, Holborn, have recently laid their tile pavements to the whole of the chancel, aisles, and lobby floors at St. George's Church, Tufnell Park, N.

**Messrs. Malkin, Edge & Co.**, of Burslem, are supplying the encaustic flooring and glazed tiles required for the new Plymouth Pier and toll-houses thereto.

**Messrs. Diespeker & Co.**, 40 Holborn Viaduct, E.C., have just completed, from their own designs, the mosaic floors in the corridors and hall of the Herkomer School of Arts, Bushey, where their work has met with general approval.

**Craven, Dunnill & Co., Limited**, of the Jackfield Encaustic, Mosaic, and Art Tile Works, near Ironbridge, Shropshire, have received orders for the tiling at the following works, which they are now carrying out:—Corporation new swimming baths, Blackburn; Conservative Club, Blackburn; George Holt, Esq., residence, Sudley; St. Mary's Church, Drogheda; Houses of Parliament, Cape Town.

**Messrs. J. & T. Birks**, of the Hartshill Brick and Tile Works, Stoke-upon-Trent, have supplied the new workhouse buildings erected for the Bath Board of Guardians—now approaching completion—with the whole of the roof tiles, ridges, and finials, braided roof tiles and blue ridges and finials, which have a nice effect as they appear on the roof. Architects, Messrs. Lynam & Rickman, Stoke-upon-Trent; builder, Mr. Gallimore, Newcastle-under-Lyme.

**Phillips' Patent "Lock Jaw" Roofing Tiles**, which the patentee claims to be wind, rain, and snow-proof and ornamental, a combination of qualities very desirable in the formation of roofs for public and other large buildings, were recently specified for, and are being used for the following, amongst other important works:—The new School of Art in Birmingham, the tile in this case being chosen in public competition with other roofing materials; the Rainhill Asylum, near Liverpool, situated in an extremely exposed spot; the recently-completed House of Mercy, built upon the highest point in Penarth, near Cardiff. In this instance, owing to the late heavy gales, the tiles have been subjected to the keenest test, inasmuch as Penarth is a town on a lofty headland jutting out into the Bristol Channel, and exposed to the winds from all parts of the compass, and in addition to this it may be stated that the large number of 12,000 tiles were used on the roof, and fixed on the principle of locking and interlocking without any means of securing them to the rafters in the shape of nailing or otherwise. Thus the tile makes a complete and effectual roof, which has been proved by the fact that notwithstanding the recent storms not one tile has been removed out of place.

**Messrs. Samuel Trickett & Sons**, Victoria Stone Wharf, Millwall, E., are supplying their celebrated red Corsehill stone for the new offices now being erected in Ingram Court, Fenchurch Street, E.C.

**Messrs. Stone Brothers**, of Bath, supplied the whole of the Bath stone, nearly 100,000 cubic feet, used in the erection of the Rothschild mansion, at Halton, near Aylesbury, which has just been completed by Messrs. William Cubitt & Co. Stoke ground was the stone chosen. The same stone is in consequence now being employed in the restoration of the neighbouring church of Marsworth.

**White's "Hygeian Rock" Building Composition** has been specified to be used in Exeter New Asylum, Preston Free Library, Swansea Workhouse, Bedwelty Union, Blanca Board-school, Penarth Public Baths, Congregational Schools, Caterham, a mansion at Criccieth, new Malting Stores at Faversham, and at a new Baptist chapel, Putney.

**The Ventilation** of the new Prince's Theatre, carried out by the *Æolus Waterspray Company*, Holborn, is effected as follows:—A heating-stove is attached to the inlet ventilator, which delivers a volume of fresh warm air through a grating set in the main wall of the building. This stream of air is subjected to the action of the spray, where it is purified; thence it is forced over the surface of the heating-stove, and a continuous current is distributed through the whole structure with rapidity and economy. The exhaust service for withdrawing the vitiated air is equally effective, and the whole arrangement has been carried out in a thoroughly efficient manner. Air is delivered with delightful freshness, and, although it has passed through the spray and over the heating-stove, there are no symptoms of excessive moisture or of harsh dryness, the action of the one apparently neutralising the other.

**Mr. E. Adams**, 7 Great Dover Street, Boro', S.E., has just completed a large contract for his patent fanlight openers and louver apparatus at the new wing of St. Mary's Hospital, Paddington, for which Mr. Steven Salter was the architect. The sashes can be opened one above the other, with ease, perfect silence, and safety, this being so different to the cumbrous and noisy arrangement they had previously. The architect has in this case so arranged the fanlight and frames that no direct draught can be felt by the patients, this requiring special modification of Mr. Adams's patent apparatus.

**Messrs. Larmuth & Sidebotham**, of Salford, have supplied, from the designs of the architect, Mr. Wm. Owen, A.R.I.B.A., the whole of the fittings for the new School of Art at Warrington; these embrace many new features of great utility, and render the general equipment of the building very perfect. The same firm have just completed an extensive contract for furniture, including wooden bedsteads, wardrobes, bookcases, tables, and miscellaneous fittings for the annexe to the County Lunatic Asylum at Prestwich, erected from the designs of Mr. Hy. Littler, for the accommodation of about 1,200 patients.

**The American Elevator Company**, 38 Old Jewry, E.C., have received several important orders lately for first-class passenger lifts. Among them, one for the Turner Memorial Home, at Liverpool; one for the Criterion, Piccadilly; and one for the Hotel Schweizerhof, at Lucerne.

**The Hopton-Wood Stone Company, Limited**, of Wirksworth, Derbyshire, have just completed the balustrade at the new Municipal Buildings, Leeds; and the same firm are about completing an extensive contract for staircase at the Victoria Hotel, Manchester.

**Messrs. Le Grand & Sutcliffe**, 110 Bunhill Row, E.C., are engaged upon some important artesian wells, one at Messrs. R. White & Son's Mineral Waterworks, Walworth, the depth of which will probably be about 200 feet. A second boring is in progress in the new red sandstone formation at the Lichfield Brewery, near Burton-on-Trent.

**Birmingham**.—An extensive and handsome range of buildings has just been completed in Albion Street, Newhall Hill, for Messrs. Bishton & Fletcher, the eminent diamond workers, goldsmiths, and manufacturing jewellers. The façade is Italian, executed in red bricks, with greensill stone strings, sills, and main cornice. The internal arrangements of the various floors have been carefully planned to meet the peculiar requirements of the various branches of the firm's business. The heating of the premises is effected by the hot-water system of Mr. R. Renton Gibbs, of Liverpool. The whole of the works have been carried out by Mr. Thomas Hughes, builder, of Hockley, under the supervision of the architect, Mr. W. Tadman Foulkes, of 100 Colmore Row, Birmingham.

## ARCHÆOLOGY.

**Roman Chester**.—The antiquarians of Manchester, Liverpool, and Chester are co-operating in a search which is now being made in what is called the Dean's Field, Chester, for Roman and other remains. An excavation was first made some 10 or 12 feet in depth, close against the city wall. Two or three feet below the surface the wall was found to rest on made ground, and no trace of a Roman character was there discovered. A trench was then commenced in a diagonal direction from the wall towards the cathedral, which is some 200 yards distant. The men had only carried the trench some three or four yards from the wall when they came upon the foundation-stones of an ancient building. The angle of the building was discovered. The stones exposed are sandstone, rough hewn, apparently with axes, and as one of the walls runs east and west it is conjectured to have been an ecclesiastical structure of the Norman period. The cathedral was formerly the Abbey of St. Werburgh, and the dean's residence, hard by, is built on the site of another religious house. The ground excavated is within the cathedral precincts, and further discoveries are confidently anticipated. The belief has long been current in Chester that portions of the present city wall date back to the time of the Roman occupation, when a wall was constructed about the city by the men of the 20th (or Victrix) Legion. There have been no less than five Centurian stones discovered in various parts of Chester, recording that so many paces of the wall were built by the men under such-and-such a Centurion on a direction shown by a sort of index arrow, but none of these stones have been found in or about the city wall, and thus doubts have arisen whether any portion of the present city wall is in reality Roman work.

## LEGAL.

Queen's Bench Division.—Feb. 1.

(Before Mr. JUSTICE LOPES.)

MARQUIS OF SALISBURY AND ANOTHER v. HURTER AND ANOTHER.

LIGHT AND AIR CASE.

The Marquis of Salisbury, as the proprietor, and F. Weiss, as the lessee, of the house No. 2 Durham Street, Strand, sought to obtain an injunction against the defendants, proprietors of the Adelphi or Tivoli Restaurant, to compel them to remove an obstruction to light and air, and abate a nuisance arising from works connected with electric lighting at the defendants' premises. The defendants did not admit that the works were an obstruction to light and air, or a nuisance.

Mr. Petheram, Q.C., and Mr. Farwell appeared as counsel for the plaintiffs, while Mr. Reid, Q.C., and Mr. Grosvenor Woods were for the defendants.

Mr. Petheram said that the works in question consisted of an engine and boiler with a tall shaft or flue, and that, besides the obstruction to light and air arising from the shaft, the operations were attended with great vibration, noise, and offensive smells, all of which interfered seriously with the comfort of the tenants of the house, and also, in some cases, with their business, while at the same time deteriorating the premises in value. The works were in a narrow yard, and the shaft was within two or three feet of some of the windows, the tenants complaining of the heat from it as part of the nuisance.

Evidence was given in support of the plaintiffs' case, and Mr. Reid cross-examined the witnesses, but eventually admitted that he could not maintain his defence.

Mr. Justice Lopes said there could be no doubt that the case for the plaintiffs was a very strong one, and that it was a very great interference indeed with any man's rights to erect such a shaft as that in dispute. The result was that his lordship gave judgment for the plaintiff, with costs, granting the injunction prayed for.

### NOTES ON NOVELTIES.

We illustrate an improved form of water-waste preventer or flushing cistern, lately patented by Mr. E. Howard, and introduced by Messrs. Hayward, Tyler & Co., of 84 Whitecross Street, London, E.C. Howard's patent cistern is a single box cistern, and therefore of moderate size and weight, but is free from the disadvantages attending almost all other single box cisterns, inasmuch as there is no interference with the action of the ball valve lever, and yet the water is perfectly cut off from entering the cistern before it begins to escape. This is effected by the patent admission

valve, which has a self-closing cut-off between the supply and the ball valve. When the cistern is at rest this valve is held open by an arm of the lever, so that the cistern is filled by the ball-valve, but as soon as the lever begins to be raised, the cut-off closes, and the water is shut off from the ball valve. The further motion of the lever in the case of a syphon cistern starts the action of the syphon, and in an ordinary double-valve cistern opens the outlet valve. These water-waste preventers have been specially approved by the authorities of the New River Company as conforming with their recent regulations. They are suited for all classes of closets, lavatories, &c., and every cistern is tested thoroughly before leaving the works.

### CHURCH BUILDING AND RESTORATION.

**Wortley.**—The new Wortley Wesleyan church was reopened last week, after the erection of organ built by Mr. Calvert, and new choir gallery, &c., by Messrs. J. Tomlinson & Sons, at a total cost of about 500*l.*, from designs by Mr. James Wilson, architect, East Parade, Leeds.

**Munster Square.**—The new north aisle of St. Mary Magdalene, Munster Square, has been opened. It is erected in memory of the founder, the late Rev. E. Stuart, its first incumbent, who in 1849–52 erected the nave, chancel, and south aisle from the plans of the late R. C. Carpenter. The plans for the aisle have been carried out with a crypt under its whole length, used as work and caretakers' rooms and for a mortuary, under the direction of Mr. R. Herbert Carpenter and Mr. B. Ingelow.

**At the Meeting of the London School Board** last week an estimate of expenditure for repairs and maintenance of schools for the year ending March 1885 was submitted, showing that the sum required would be 950,804*l.* This sum included—Maintenance of schools provided by the Board, 495,741*l.* 6*s.*, against 452,576*l.* 5*s.* last year, showing an increase of 43,165*l.* 1*s.*; school buildings, alterations, &c., not chargeable to capital account, 27,500*l.*, against 20,000*l.*, an increase of 7,500*l.* Authorisation was also given to the Committee to obtain plans for the extension of the Board offices, at a cost not to exceed 15,000*l.* for the fabric.

### GENERAL.

**Mr. J. P. Seddon** will deliver an address on "The Ventilation of Theatres" at the Parkes' Museum of Hygiene, on Tuesday, the 12th inst.

**Mr. Penrose**, architect to St. Paul's Cathedral, has made an inspection of Riddings parish church, in connection with the proposed building of a chancel and general repairs to the building.

**At a Meeting** of the Scottish Society of Water-Colour Painters, in Glasgow, the following were elected associates:—Mr. James Paterson, Mr. David Farquharson, A.R.S.A., Mr. Thomas Scott, Mr. C. J. Lauder, Mr. A. Black, and Mr. W. B. Hole, A.R.S.A.

**There is now on View**, at Mr. McLean's Gallery, 7 Haymarket, Mr. Pownoll Williams's sketches and drawings on the Riviera and the Lake of Como.

**A Conversazione** was held in the Fine Art Galleries, Sauchiehall Street, Glasgow, on Monday evening on occasion of the opening of the twenty-third annual exhibition of modern art promoted by the institute.

**The Three English Artists** who have been invited to contribute to the forthcoming Exposition Internationale at the Arts Décoratifs in Paris are Mr. Orchardson, R.A., Mr. E. J. Gregory, A.R.A., and Mr. R. W. Macbeth, A.R.A. Mr. Burne Jones was originally included in the invitation, but was unable to accept it this season. Mr. Orchardson will be represented by *A Social Eddy*, and by *Napoleon on the "Bellerophon."*

**The Free Schools** for instruction in water-colour art, which have been organised by the Royal Institute of Painters in Water-Colours, were opened on Monday in the studios attached to the Working Men's College in Great Ormond Street. There are at present about thirty students.

**It is reported** that the Duke of Wellington's statue at Hyde Park Corner is to be removed to a site overlooking the North Camp at Aldershot. The road by which the statue will be conveyed will be somewhat circuitous in order to avoid weak bridges, but the removal has been reported to be practicable. It is understood that another statue of the Duke will be erected on the site of the old one.

**In the description** which accompanied the illustration of Eastcheap Buildings in our issue of last Saturday, the passenger-lift was mentioned. The lift is one of Messrs. Waygood & Co.'s patent hydraulic balanced lifts, without balance-weights or chains, or any overhead gearing. As many as twelve persons have been raised by it into the fourth floor, a distance of 50 feet, in fifteen seconds.

**The Linerusta-Walton** has been awarded the gold medal and the highest class certificate at the Calcutta International Exhibition.

**Glasgow Architectural Association.**—The usual monthly meeting was held on Tuesday night, the President, Mr. P. M. Chalmers, in the chair, when a paper on "Electric Lighting" was read by Mr. J. R. C. Honeyman.

**Contracts for Building the South Cliff Hotel**, Scarborough, are to be obtained, and the work is to be carried out with as little delay as possible.

**Two Ventilators** on the District Railway, at Westminster, near the Houses of Parliament, have lately been removed and the roadway reinstated in its original condition.

**The Indian Government** has published reports of preliminary surveys of some new and important railway lines. The first of these, intended to connect Assam with the sea, will run from Chittagong through Cachar to Dibröogurh with a branch to Gowhaty. The total length—736 miles—is estimated to cost 6,46,73,000 rs. A line is also projected from Mogul Seria, near Benares, through Chota Nagpore and Orissa to Pooree, with a branch to Gya. The length will be about 652 miles, and the cost about 6,82,00,000 rs. The latter line will pass through extensive coal-fields, and will afford a short route for pilgrim traffic between the North-West and Pooree.

**It is intended** to erect a new school and class-rooms, with dormitory, adjoining the present Choir School House of All Saints, Clifton. Mr. E. Henry Edwards, of 5 Clare Street, Bristol, is the architect.

**The Manchester Literary Club** on Monday decided that, in accordance with the suggestion made at the last meeting, to issue a hand-list of the deceased and living artists of Lancashire and Cheshire, with a view to the compilation of a biographical dictionary, giving particulars of the deceased artists, and the names at least of the living men.

**The Students of the Institution of Civil Engineers** have just been notified of the resumption of the meetings for the reading and discussion of original communications by members of their class. The first of this series of meetings took place on Friday evening, when a paper was read by Mr. W. R. Moreland, on "Constructional Ironwork for Buildings," Mr. J. Wolfe Barry, Member of Council, presiding. The meetings will be continued on Fridays, the 5th and 22nd inst., under the respective presidencies of Mr. B. Baker and Mr. T. R. Crampton. The Council desire that students who have promised papers for subsequent meetings will forward them to the Institution without delay, so that no break may occur in the continuity of the meetings.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 9, 1884.

### TENDERS, ETC

\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### COMPETITIONS OPEN.

ABERDEEN.—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

BLOEMFONTEIN.—Mar. 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

KNIGHTON.—Feb. 21.—Plans are required for a Stone-built Workhouse for 120 Inmates. Mr. E. H. Deacon, Clerk to the Guardians, Knighton, Radnorshire.

LEICESTER.—March 1.—Designs are invited for a Block of Buildings proposed to be erected on the South Side of New Entrance to the Market Place. Premiums of £25 and £15. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

LONDON.—March 1.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

NEWCASTLE-ON-TYNE.—March 29.—Designs are invited for Baths and Washhouses, to be built on three sites within the City. The City Engineer, Town Hall, Newcastle-on-Tyne.

WIDNES.—Mar. 20.—Designs are invited for Public Offices and Town Hall. Mr. J. T. Allen, Public Offices, Widnes.

### CONTRACTS OPEN.

BACUP.—Feb. 14.—For Building Chapel and School at Troughgate, Britannia. Messrs. Maxwell, Tuke & Hurst, Architects, 175 Lord Street, Southport.

BARNESLEY.—Feb. 16.—For Building House and Shop. Messrs. Dixon & Moxon, Architects, 5 Eastgate, Barnesley.

BIRKENHEAD.—Feb. 15.—For Supply and Erection of Ironwork in the Retort-house at the Gasworks, Thomas Street. Mr. T. O. Paterson, Engineer, Gasworks, Birkenhead.

BANGOR.—Feb. 11.—For Building Houses, Craig-y-Don Estate. Mr. Richard Davies, Architect, Bangor.

BROCKERMET.—Feb. 11.—For Building Dwelling-house and Stables. Messrs. T. L. Banks & Townsend, Whitehaven.

BOURNEMOUTH.—March 1.—For Building Dwelling-house, West Hill Road. Mr. Herbert W. Dibden, Solicitor, Wimborne.

BRADFORD.—Feb. 22.—For Building School Chapel, Four Lanes End. Mr. W. Rycroft, Architect, 85 Chapel Lane, Bradford.

BRIGHTON.—For Building Wesleyan Chapel, Preston Road. Messrs. C. O. Ellison & Son, Architects, 62 Dale Street, Liverpool.

BRUMBY.—Feb. 20.—For Building Cemetery Chapel, Lodge, Walls, and Entrance-gates. Messrs. Bellamy & Hardy, Architects, Broadgate, Lincoln.

CHELTHAM.—Feb. 18.—For Building Boarding-house, Bayshill. Mr. J. Middleton, Architect, 1 Bedford Buildings, Cheltenham.

DENTON HOLME.—Feb. 12.—For Building Block of Cottages, Cow Byre, and Slaughter-house. Mr. George D. Oliver, Architect, Carlisle.

DUBLIN.—Feb. 13.—For Alterations and Additions to House and Premises, 106 Capel Street. Mr. J. Freeman, City Architect, Town Hall, Dublin.

DUNFERMLINE.—Feb. 14.—For Construction of Galleries, Carnegie Baths. Messrs. Campbell, Douglas & Sellars, Architects, 268 St. Vincent Street, Glasgow.

EBREW VALE.—Feb. 16.—For Erection of Hotel and Stable Buildings. Mr. E. A. Johnson, Architect, Abergavenny.

ECCLESFIELD.—Feb. 9.—For Building Board School at Burncross. Messrs. Wilson & Masters, Architects, Hartshead Chambers, Sheffield.

FINTRAY.—Feb. 16.—For Building Dwelling-house at Posnett. Mr. Warrack, Newmill, Fintrey.

GATESHEAD.—Feb. 9.—For Building Church of the Venerable Bede. Messrs. Oliver & Leeson, Architects, Bank Chambers, Mosley Street, Newcastle-on-Tyne.

GLANADDA.—Feb. 12.—For Building Houses and Shops. Mr. Richard Davies, Architect, Bangor.

combined, comparatively equal to new.—Apply to ROBEY & CO.,  
Globe Works, Lincoln.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS

### FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper, under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring-boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For Coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use. A horizontal boiler, 17 ft. 6 in. long, 15 H.P. gave the following results: Temperature on plates, 180 deg. ditto on cover, 94 deg.; 1 ton of coal was saved per week, and although the fire was raked out every evening, 20 lb. of steam were in the boiler next morning. The following Testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 23, 1883.  
Dear Sir,—It may interest you to know that we have exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

## BELL'S ASBESTOS SASH-LINE CORD

Is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire-escapes.

## BELL'S ASBESTOS FUEL.

For gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

## BELL'S ASBESTOS PAINT.

For coating woodwork. This paint is absolutely fireproof. The following Testimonial refers to this Paint:—

"Glasgow Herald and Engineering Times" Office, Glasgow.  
14th Nov., 1883.  
Mr. JOHN BELL.  
SIR,—As one of the means that helped to save the buildings extending from Buchanan Street to Mitchell Street from the recent great fire I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the "Engineering Times" case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of your Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood thrice coated with Irish Lime at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

To avoid spurious imitations, and to secure the receipt of genuine goods, all orders should be sent direct to the undermentioned addresses, and not through agents or factors.

# The Architect.

## BUILDING FOR IMMORTALITY.

NE of our favourite cathedrals is just now a sad example of the vanity of human ambition. "The best laid schemes," says BURNS, "of mice and men, gang aft agley;" they go oftentimes, that is to say, very much awry; and, amongst the most favourable varieties of this world's enterprise, it is to be feared that architecture for one has furnished its full share of illustrations for the maxim. Simultaneously with the intelligence that reaches the public respecting the ruinous state of things at Peterborough, we find some one

in a contemporary advocating with an appearance of earnestness the construction of the proposed new Admiralty and War Offices, in such a material—granite to wit—as shall endure for ever. The contrast between these two cases is suggestive of reflection in many ways. Possibly there may be only a shrewd northern stone merchant at the bottom of the one, while some exceptional misadventure of old time may explain the other; but it is not worth while to deny that the passion for immortality of building is a human impulse not yet extinct, which has produced in the past, and will produce in the future, many genuine successes and many conspicuous failures.

It is a long way from the Pyramid of CHEOPS to a block of London offices, as everyone will be willing to admit; but it would seem as if it were an equally long way to a great Mediæval church, a proposition which few of us have hitherto supposed to be the fact. There are some who do not forget, of course, what took place at another English cathedral some two-and-twenty years ago; but this only emphasises the lesson taught in both cases—for they are very much alike—to all those in the architectural world with whom a truly high standard of building is but a matter of theory, if even so much. The fact is that architecture of the highest order of construction is now almost, if not quite, unknown. Science, so to speak, has driven it out of the world—the science of administrative economy. The first axiom of this science is that material and labour must not be wasted; that excess of substance or of care is a discredit to the designer; that something like a mathematical balance in all things is essential to duty. We are so accustomed to square accounts in the ordinary affairs of life, that we cannot discern the difference between a correct balance-sheet in pounds, shillings, and pence, without a farthing to spare, and a statical balance of this and that structural strain, which waits only for the inevitable unforeseen to overturn its equilibrium, with nothing to save it. Without going too far in the direction of building with the hope of immortality, why might we not try to do a little more in the way of building for at least a liberal interpretation of the masculine idea of permanency?

Perhaps it is only monumental architecture that is worthy in any case of the highest order of construction; but even the term monumental has to be taken here with a qualification. So little work in any sense monumental do we undertake in England, that critics are obliged to encourage the ambition of architects by applying the term to such examples as a provincial town-hall, a suburban church, even a market for meat or an exchange for corn. But in truth all of these, except occasionally the church, are mere shelters that perish with the using. We except the church because the temple of divinity, in whatever form and for whatever faith, if a temple at all, has always offered itself as a fit subject for monumental dignity and for monumental immortality. The temples of antiquity have no doubt succumbed to the violence of religious fanaticism much more than to the legitimate influence of time; but whenever they have fallen through age, the noblest and the humblest alike, and those of the most refined cultus no more or less than those of the most barbarous, they may be said to have yielded only to the hand of heaven in spite of all that earthly ambition could do.

After the revelations that have been brought to light with regard to the building construction of Peterborough Cathedral—and the self-same discovery was made in another case, as we

have said, not long ago (at Chichester)—there are many of us who may begin to suspect the stability of the great edifices of the Middle Ages generally. The extreme lightness of their construction has long been remarked upon as a triumph of skill. The test known by the name of "the ratio of the points of support" is often quoted for our admiration. That is to say, whereas in St. Peter's at Rome the area of walling upon the plan is in the aggregate one-fourth of the space of ground covered by the roof, and in St. Paul's at London one-sixth, in the Mediæval cathedrals it is less than one-seventh, including the solid masses of western towers, whilst, excluding these, it is in some cases almost startling in the insignificance of its proportion, looking more like such a thing as timber or ironwork than stone masonry of any practicable kind. What shall we say, then, when we are told that an edifice of this class, in which one ought certainly never to expect to find anything but scrupulously uncompromised solidity as the first condition of a universal scheme of slender arcuation, has for the interior substance of its walls and piers a mere concrete of pebbles and the dust of what once was clay-mortar, depending for the very retention of the form of wall or pier upon a thin casing of surface stone, itself without bond and dislocated and wasted by time? "Lantern and piers alike," says the Dean of PETERBOROUGH, "were of the most wretched construction. The walls of the lantern, dating from the fourteenth century, were mainly composed of rubble and pit mortar" (Mr. PEARSON calls it "sandy earth"), "with a very thin facing of Barnack stone. . . . When the piers were reached, which had been crushed and peeled off by the too great pressure of the heavy Norman tower, . . . it was found that they were of no better masonry. . . . The core of these great Norman piers was nothing but dust." And all this had for foundation only "small stones laid on loose gravel; . . . although, if the builders had gone some 3 feet lower, they would have touched the solid rock!" What a satire upon building for eternity? If anywhere a grand monumental edifice is to be found, it ought to be such a one as this cathedral, and yet it is built of rubbish. But, what is a stranger fact, it has stood erect for centuries; a fact, again, which is almost less astonishing than another, namely, that on the very spot where a first cathedral had gone to pieces through such construction, the builders of a second had built not a whit more wisely. We may certainly congratulate ourselves upon being well assured that, whatever may be the faults of our modern restorers and reconstructors of churches, they cannot be charged with work quite so bad as this. But still, is their work immortal?

The question is not easily answered if we ask what kind of edifices ought in England to be built in monumental strength so as to last for ever. Churches would seem to have the first claim upon such dignity, no doubt; in other words, there is a large majority of the English people in whose minds, apart from all the many differences of religious creed and discipline, the establishment of a temple for Christian worship is an act of everlasting homage to the claims of virtue. Save a few small and unimportant sects, all denominations alike are found to cherish the sentiments which make a church a monument. And accordingly we may say without further phrase that the churches of England, taken in the aggregate, are clearly recognised as the monumental architecture of the land. At the same time we cannot allege that they are truly of this character so often as they might be. In a word, the genius of economical adjustment pushes its way to the front in almost every case. A few examples are conspicuous to the eye of the connoisseur here and there, in which not only has commonplace parsimony been repudiated, but the liberality of an exalted ideal has been accepted in its stead. But even in such rare instances it can scarcely be affirmed that liberality has reached the truly monumental standard of immortal building. Perhaps the whole principle of Mediæval lightness of construction, so much admired, is in its modern interpretation especially misleading. Massiveness, even exaggerated, may certainly be much more wisely advocated as an essential element in building for posterity; and if this is a massiveness almost exclusively identified with primitive times or primitive manners, perhaps we only need to suppose that the primitive intellect must have possessed a nobler idea of the act of "longing after immortality." The time has come when even bridges across great rivers and lighthouses in stormy seas are built of slender ironwork instead of mighty stone, when an Albert Memorial has its iron ribs as a Crystal Palace has its cage of wire; we talk complacently of "iron and

plaster, the materials of the future," iron that dissolves into rust and plaster that crumbles into powder; sufficient for the day is the work of the day, and to-morrow must provide for itself.

### GENUINE WORKS OF ART.

THE high esteem in which famous works of art are held is not an altogether unmixed tribute to their artistic merits. We prize a TITIAN or a TENIERS not only for the beauty of the colour in the one, or the homely force of the other, but because we have in the pictures the undoubted handiwork of an illustrious artist. Part of the value put upon such a work of art resembles the price paid for an autograph or a relic; or we may compare it with the value attaching to some unusual gem, of which the beauty and the rarity are both esteemed precious.

It is no secret that if two equally powerful pictures were brought to the hammer, one of which was undoubtedly the work of a master whose pictures are sought after, while the other could not be attributed to any known master, the anonymous picture would not, however great its merits, find a purchaser at a price approaching that of the other. And though this criterion may be objected to as a coarse one, the same result would be arrived at by other tests. The critics are in this respect more exacting than the general public. The crowd may perhaps admire a picture that is striking, or a statue that is noble, without caring to ask who made it; but the select few will inquire first if the work be authentic, and only in the second place if it be excellent.

Should the work of art be one of great antiquity, so that its authorship cannot be attributed to any individual, its authenticity may consist in its being an undoubted specimen of the age to which it is attributed; and under such circumstances almost, if not quite, as much value will attach to it on this ground as though it were possible to attribute it to some individual master. This sort of authenticity it is which was lately disputed in the case of part of the collection of antiquities from Cyprus made by General DI CESNOLA. The General, it may be recollected, spent many years in Cyprus, and there formed a splendid museum of works of ancient art, which the American Government purchased from him. We regret that, as stated in *The Architect*, a long and costly litigation has risen in consequence of its being alleged that the General had done or permitted some kind of restoration or alteration which had destroyed the genuineness of some of these objects. The result of the appeal to law was in General CESNOLA'S favour; but the occurrence suggests the subject as one to which attention may very well be directed.

The result of reflection will be to convince us that any kind of addition to or alteration of an authentic, and especially an ancient, work of art is *primâ facie* undesirable and dangerous, but that there are some circumstances under which it is unavoidable. It is idle to say that in no case should anything which possesses artistic value be touched at all—as idle as to maintain, on the other hand, that we are free to deal with the works of our forerunners in the arts exactly as we like, and to alter them just as we think best. It will also be felt that some classes of objects are from their nature or their use more unfit for the restorer's hand than others which cannot well be left untouched; and it will even be seen that the case is not quite the same in reference to works of sculpture, of painting, and of architecture. Taking works of sculpture first, the British Museum will afford an easy means of contrasting works that are wholly untouched with others that are not so. If we visit the Græco-Roman collection, consisting for the most part of replicas of very celebrated Greek statues copied for Roman patrons by clever Greek sculptors, we find hardly a specimen free from some additions, or, as the catalogue terms them, restorations. Here an arm, there a leg, very often a nose, has been supplied, no doubt for the most part by fairly clever sculptors. The result is, that the statues look much better to the eye of the ordinary observer than if they were without their restorations, and that as the learned have been used to them, they are tolerated, if not liked. The proposal to take away from these works every portion not ancient would be probably rejected as, if not barbarous, at any rate hypercritical by ninety-nine out of a hundred. We have only, however, to pass through an open doorway, and in the Elgin room we find ourselves in the presence of the finest sculptures of

antiquity. The ruined, battered fragments of statues from the pediment of the Parthenon, and the mutilated groups from the metopes and the frieze, have not been restored. Were such a proceeding even suggested, the outcry which would justly rise would be of the most clamorous and indignant kind, and this not only, perhaps not chiefly, because the works have never been touched, but because they are too precious to touch. We may, however, go further, and say that if any fresh collections of antique work of fairly moderate excellence were now acquired, and came to this country untouched, the public feeling of the present day would probably be decidedly against any attempt to supply missing ears, or hands, or feet, or broken noses or knees, in the manner in which such repairs were formerly done by the Italians who collected the statues already referred to.

Thus far, then, we seem to gather that there is more to be said against the restoration of ancient works of sculpture than in its favour, and that the finer the sculpture the more distasteful will any tampering with it be. The handling of a second-rate man may perhaps be matched by another on the same level, but the touch of a truly great master is too subtle to be approached by ordinary skill, and too precious for even a fragment of it to be disturbed.

Old pictures are admitted to be more liable to require, or at least to provoke or suggest, the operations of the restorer than any other works of art. Dirt accumulates and must be cleaned off. Accidents damage the surface, and to paint in a patch seems so easy. Colours fade or fly, and a little glaze deftly applied seems likely to restore the harmony of tinting which the original work possessed, and so forth. The picture-restorers' craft has existed for centuries, and the idea of touching up a picture somehow seems hardly to be so utterly repugnant to the mind of the connoisseur in the art of painting as might have been expected. Still there is no doubt a strong feeling against the practice, and this dislike is probably a growing one. The exhibition now open of works by Sir JOSHUA REYNOLDS may be taken as affording good examples of the accidents which the picture-restorer is tempted to repair, and many specimens of touched and some of untouched pictures. The carnations have faded from many a sweet face in this gallery once bright with the glow of health; and no doubt it would be in many cases quite possible to bring back to the picture a close approximation to the colours which it must have presented when first painted; and this has in some instances been attempted. Most admirers of REYNOLDS, however, would prefer to retain untouched what time has spared of the actual work of the great master of portraiture, and will look with suspicion upon such restorations as have been carried far, and even regard the pictures on which such work has been done as deprived of no small part of their authenticity.

The question of restoration in architecture is not one to be disposed of in a paragraph or two, unless we content ourselves with borrowing the oracular words of Sir ROGER DE COVERLEY that "there is a great deal to be said on both sides." We may, however, point out that a building, however noble, is not only a work of art, but a great fabric, exposed to all the destructive accidents and influences due to decay, weather, neglect, war, fire, and violence, and that it is, generally speaking, a structure with some purpose to serve or employed in some way for the objects of life. It is obvious that repair is needed by a building to an extent that no other work of art will require, and also that, with the exception of sculpture, there is nothing in it which takes the shape of the manuscript work of the artist. The ideas of the original architect were rendered in stone by the handiwork of artificers; and if the skill of the masons of our day be equal to that of their forefathers, and the intention of the architect be still clearly traceable, notwithstanding decay or damage, then a perfect restoration seems at once more easy and more defensible than in the case of any other work of art. It is from the neglect of these conditions, or the impossibility of securing them, that mischief has arisen. Either the original mouldings or treatment cannot now be made out, or have not been followed, or modern masons and those who direct them are not skilled enough to reproduce them, or perhaps decayed carving has had to be replaced by the work of modern carvers, and, of course, in these cases damage has been done. It would, however, be simply impossible to leave such a structure as Peterborough tower to stand till it fell, or to abandon Chichester to ruin because the steeple had fallen. Repair in such cases is unavoidable, and the object of every true architect charged with such repair is to make it as conservative as possible.

Probably the true wisdom in the case of works of sculpture, and possibly of painting, is to be content with simply taking care of them, to admit no restoration or even repair, so that if an antique statue be headless or without an arm we should leave it as it is found—to let it remain a fragment, thoroughly authentic if incomplete; if a picture be fading let it be protected from light when possible, but not touched up and brought back to its original brightness. These rules cannot possibly extend to architecture, whatever Mr. MORRIS may urge to the contrary; but they may serve to draw attention to the undesirableness of anything like obviously new work, unless it be in the shape of additions or substitution of new for what is hopelessly decayed or injured. Such a restoration as, for example, that of the chapter-house at Westminster, where the original architect's design has been recovered in every particular and once more placed before us in its perfect completeness, is a distinct rescue of a perishing work of art from absolute ruin, and has enriched Westminster by giving a new lease of life, so to speak, to a great monument. Such a work may be safely appealed to as a sufficient vindication of the practice of restoration as applied to architecture.

### MESSRS. GOUPIL'S GALLERY.

THROUGH the handsome galleries of Messrs. GOUPIL in New Bond Street pass from time to time pictures that have been conspicuous within Continental exhibitions, and without exaggeration may be called eventful when shown in London. Such a picture is just now on view, the *Psyché* of JULES LEFÈVRE, which both at the Salon and at the Exposition Nationale of 1883 added distinction to the artist's reputation.

The Puritanic misconceptions of art which until recently, and even yet, hamper the study of the nude, and frown upon the admission of the undraped figure to the walls of our public galleries here in England, play no such part in Paris. There, on the contrary, the pure freedom of art has in this matter degenerated into license, and the annual exhibitions, whether at the Salon or elsewhere, testify to an audacity of meretricious taste—to use no harder term—which has passed the bounds of decency and rebelled against the ordered dignity of true art. But M. LEFÈVRE stands apart from such lawless extravagance, and, while assuming to the full the right of the painter to represent the most beautiful thing in creation, the nude female form, he shows a fine reticence, and lifts his subject in the grasp of an elevated style. Yet we must allow that the *Psyché* is quite modern; it is, that is to say, neither Greek nor pseudo-Classic; it differs from INGRES as much as from PHEIDIAS. The forms are neither combined by selection into an ideal type, nor sought by elimination of the sensuous from a model of alluring contours. This *Psyché* of M. LEFÈVRE has the purity of undeveloped womanhood. She is a young girl; the long supple lines of her figure, the extremities a little large though delicate, the firm yet tender curves, all show a frame that will flower into large luxuriance, but is as yet in the exquisite beauty of the half-opened blossom. Herein the feeling is modern; we have the particular rather than the general, the individual rather than the ideal. The head, too, carries out the same treatment. The profile is sensitive, with features regular, but softly rather than sharply cut; the nostril is shallow, the upper lip a little long, the eyes set high in a brow not highly developed, and the simplicity of the type is aided by the long drift of reddish flaxen hair parted low on the forehead, caught together at the back of the throat, and hiding in its fall the line of the girl's back.

So much for the style in which M. LEFÈVRE has treated the *PSYCHE* of the classic myth as to form and type. We have to add that the same principle dictates the colouring. This artist has a reputation for flesh-painting; his technique is undeniable. Here he steers with consummate skill between the chill negation of INGRES and the palpitating realism of the modern sensationist, between the waxen prettiness of the sentimental school and the brutal coarseness of the advocates of the ugly. The pearliness and tenderness of the flesh-painting here remind one of PYGMALION's statue when the gods have granted the warm pulse of mortal woman, but as yet the living image stands on her sculptured pedestal. It is no wonder that the painter of *Psyché* serves as exemplar to young students; his brush-work shows the expert in method as his outline confesses to a master of drawing. That in colour this picture

is wholly satisfactory we are not prepared to admit, although the scheme is deliberately chosen to emphasise the character of the design. The girl is seated in profile upon the edge of a bare cliff tinted in brown greys; a pale lilac scarf, spread beneath her, falls over the rock; beneath stretch in green wavelets up to the horizon the waters of Acheron; the background of Stygian gloom, across which flit the pale ghosts of the dead, darkens above and around the figure of *PSYCHE*, as she waits for the ferryman *CHARON*, holding her precious casket with both hands above her knees. The effect is cameo-like in relief, and the broad and somewhat negative plan of colour, while it gives contrast, brings no charm in itself to distract the sense from the power of the design. Decorative, as opposed to actual and realistic, this picture is, but decorative as a marble frieze or a vase painting. As we have said, the *Psyché* is only in passage through London to its destination in Philadelphia, the owner being an American lady, who must be congratulated on her enterprise and taste; but a line engraving is promised on moderate scale.

The *Psyché* is not the only picture of mark at Messrs. GOUPIL'S. Three notable English canvases are for the moment on view—ROSSETTI'S *Day Dream*, MILLAIS'S early *Isabella*, and a composition in HERKOMER'S Tyrolean vein, of peasants descending a mountain path, shown at the Academy some years ago; all three pictures one is glad to see again. On another wall hangs the large, life scale, single figure, by JOZEF ISRAËLS, which was at the Amsterdam exhibition—an old fisherman standing in the waves, dragging for mussels. Very broad, bold work it is and full of vigorous life, but hardly so satisfactory as the painter's smaller subject pictures; his technical mode becomes, on the large scale, coarse without corresponding mastery. A small picture of incident, by E. DANTAN, is admirable for artistic management and quiet completeness of narrative skill, but the way in which the story of the boy's maimed hand, now in process of being bound up by a young surgeon, is told by aid of the basin of blood and other ghastly accessories, savours too much of the taste for horrible detail. A piquant head, by JACQUET; a fresh and delightful study of a girl's head and partly uncovered bust, by the Belgian C. HERMANS, are again among the attractions of the gallery. In landscape there are still some of the clever and artistic coast and sea studies—*en grisaille*, one might say, so studious of greys is the painter—by Mr. BLOGGS, the American pupil of M. GÉRÔME. One or two luminous bits by the Alsatian, M. ZUBER, are well worth looking at; a little crude in the impasto, as is the fashion with young France, but brilliant and keenly accented. A sylvan scene by COROT, of the best kind, and a number of capital bits by an old favourite who still enjoys the favour of the knowing, M. DIAZ, are also among the baits for happy collectors. MM. GOUPIL'S print room always abounds in good things of reproductive art. The version of Mr. WATTS'S portrait of *Cardinal Manning* is among the happiest specimens of the *photogravure* which, as in this case, translates the best qualities of a painter's work.

### THE INCIDENCE OF BUILDING RISKS.

[BY A CORRESPONDENT.]

(Continued from page 87.)

RISK (6) in Mr. RICKMAN'S schedule is "the use of materials from the estate." This sometimes is a removal of risk rather than an addition to it. The building owner agrees with the builder to supply him with (say) bricks at 25s. per 1,000 fit for use in the work. The risk as to the quality and price of bricks is removed from the builder, and the value of brickwork (so far as bricks are concerned) becomes a simple arithmetical calculation. Trouble (and trouble in building works means always some cost) does often occur in the use of materials from the estate—from local causes or agents' caprices; but usually a builder does not run much risk under this head.

Risk (7) should be divided into two parts—(A) the state of the adjoining premises as affected by the proposed works, and (B) the condition and value of the old materials which may have to be raised. As to the first portion (A), it may be said to be one of the debatable risks as to whether it should remain with the building owner or be transferred (for a consideration) to the builder. Every case should be governed by its special circumstances.

In all cases in town work where adjacent buildings have to be interfered with, especially where party walls have to be pulled down and rebuilt, there must be exceptional risk, and the architect and builder must settle between them who shall take the risk. The cost of reinstating the adjoining premises may be so indefinite, not at the discretion of the architect or builder of the new building, but depending on the requirements of the adjoining owner, and probably his architect, that the risk should remain with the building owner, the builder doing what he is ordered under the immediate direction and superintendence of the architect and his clerk of works. But there are many cases in which, by care and judicious management of the builder's foreman, the adjoining building may be protected from serious injury; and in such cases the builder can well afford to take the risk on receiving a fair equivalent for it, thereby earning a good profit for himself and benefiting the building owner by giving him the benefit of the builder's skill and experience in dealing with difficult works. But in all cases of doubtful risk, the element of fair play as between builder and building owner should predominate, the builder taking such risks as are intelligible, and carrying out the works to the hidden risks at a fair profit to himself, but at the least possible expense to the building owner. As to the division (B), "the condition and value of the old materials which may have to be used," there can be little doubt that, as a rule, the best course for the building owner is to sell all the old materials as they stand, and have them carted off the premises. Old materials in a new building are usually a nuisance, and cause more trouble than they are worth. Where, however, it is decided to use old materials, the builder must exercise his judgment as to what they are worth after all expenses have been incurred upon them, and it will be generally found that neither the building owner nor the builder benefit by their re-use.

Risk (8) is stated as "risk of irregularity of payments and the failure of the employer." This is purely a commercial risk. Before undertaking the contract the builder should satisfy himself as to the capability of the building owner to pay for the building; and if he has any reason to doubt this capability he had better decline the work than run the risk of irregular payments and ultimate failure, to protect himself against which he cannot introduce any equivalent.

Risk (9) is "penalty as to time of completion." Notice of a "penalty" or "liquidated damages" is usually found in a contract. It is very seldom enforced. So many circumstances are against its enforcement that it is of little use in contracts where fairness has prevailed; but it is necessary, perhaps, that these "penalty" clauses should remain in ordinary contracts, as they do afford some security against very unscrupulous men. Before undertaking a contract to execute a building in a given time, the builder should consider if the work can be done in the time named without extra expense to himself. If it can, the "penalty" may be disregarded; but hurried work is expensive work. Overtime is very expensive to the builder: more money paid and less work done per hour is the result. Working before or after daylight in new buildings causes increased expense to the builder. Crowding more men upon the building than can work with comfort adds greatly to the cost. That work is the most satisfactory and most remunerative to a builder which is done in the shortest time without incurring additional expense. If a building owner wishes to have a building done in an unreasonable time (and many do), the builder must protect himself by adding such increased price as will compensate him for increased cost and trouble. A penalty is not a terror, scarcely a risk, where fair time is allowed for doing the work and there is a fair intention to do it; but when the time is not reasonable, and there is a penalty clause, it is expedient to add the amount of the "penalty" for the difference between fair and unfair time to the original "fair" amount of the estimate. By what means the architect or building owner determines the amount to be named as "penalty" is not material to the builder. It is the amount which is of importance to him. If excessive, he should refuse to be liable; if reasonable in amount, but unreasonable in time, the builder should take care that he does not lose for the benefit of the building owner.

Risk 10, "risk of accident to the public and to workmen employed." This real risk is too little thought of by builders in making estimates. Accidents will happen, and should be insured against. Some works are more liable to accidents than others, and in a dangerous work an increased allowance should

be made to cover the risk. Accidents to the public can usually be guarded against—the cost of precautions is almost sufficient insurance against that; but accidents to workmen are frequently happening, too often from their own recklessness or carelessness, and the Employers' Liability Act has so greatly increased the risks of builders that they should provide against them, as far as possible, by direct insurance with the companies formed for the purpose, and by special insurance in each contract, according to its special circumstances.

Risk 12 is stated by Mr. RICKMAN as "the unexpected views of the intentions of the Legislature by the administrators of Acts of Parliament." This may be a risk, and it is possibly clear to Mr. RICKMAN how it affects the builder; but until it is defined by illustration or otherwise it may be passed as too remote for consideration.

Risk 14, and the last in the schedule considered to attach to builders, is "the danger of inaccuracies in the estimates." This risk may be divided into two classes, (A) inaccuracies of quantities, and (B) inaccuracies of calculations. As to (A) inaccuracy of quantities, builders ought to be relieved from any risk as to the accuracy of quantities. In tendering by competition for the benefit of the building owner, that he may get his work done at the lowest market price, the cost of making estimates is surely a sufficient burden to throw on the builders. This expense is a large one, as builders well know, and as each builder tendering in competitions must fail to obtain the majority of the work for which he tenders, the cost of the whole (forming part of the establishment charges) must be carried by the profit of the works for which he is lowest. It is the duty of the building owner to supply to the builders tendering bills of quantities, of which the accuracy is guaranteed either by himself or by responsible surveyors who are employed on his behalf to prepare the bills of quantities. For the purpose of this paper we may leave out of consideration the cases mentioned by Mr. CATES in the discussions at the Surveyors' Institution, where architects take out their own quantities and stipulate that they are not responsible for them. If builders are found foolish enough to tender for works from quantities clogged with such a proviso, their blood must be on their own heads. But in the case of builders tendering from quantities supplied by Her Majesty's Office of Works, it is desirable to make some remarks. The terms issued in the advertisements of Her Majesty's Office are—"The Commissioners do not hold themselves responsible for the accuracy of the bills of quantities, which must be verified by the persons desirous of tendering." The Commissioners are building owners. Their architects are of their own staff. They have the choice of the most qualified men to act as their surveyors. Their contracts ought to be the embodiment of all that is fair, upright, and business-like. If Her Majesty's Commissioners may take the liberty of imposing risks upon builders for which they get no consideration, to what lengths may committees for public or charitable institutions go? Or a private individual who is a building owner, why should not he say, "Her Majesty's Commissioners do not hold themselves or their surveyors responsible for the accuracy of bills of quantities supplied by them for their works, and builders take them as readily as if they had the fullest guarantee; why should I or my surveyor burden ourselves with any responsibility? Let the builders take the risk; who cares for them." It has been one object of this paper to show that no builder should take a risk or responsibility on himself without receiving an equivalent fully equal to the extent of any risk he may run. This is not a question of admitting "elasticity into contracts." The contracts with Her Majesty's Commissioners should be to execute defined works according to drawings and specifications for a defined sum. If Her Majesty's Commissioners would leave the question of quantities alone altogether, they would attain this. The competent surveyors whom they employ would willingly take the responsibility of the accuracy of bills of quantities supplied by them, which, as professional men of good standing, they are bound to do. It is not to be supposed that Her Majesty's Commissioners obtain the services of the surveyors employed by them at a lower rate than the proper professional charge because they relieve the surveyors, as well as themselves, from responsibility for accuracy. If they did so, it would take very strong language to properly characterise their conduct. Who, then, benefits by this repudiation of responsibility? Surely not Her Majesty's Commissioners, or the public whom they represent; for, other things being equal, builders would certainly tender at a lower rate under proper

and unfettered conditions than where the building owner deliberately repudiates the liability which should fall on him. It deprives Her Majesty's Commissioners of the benefit of any tenders from the very best class of builders, for, very properly, some few firms of the highest standing will not tender for any work where the conditions are unfair as these are. Certainly the builders are not benefited. A man carrying on his business in a proper way should say I will not take this additional risk without its equivalent, and if I am to "verify" these quantities I must include such sum in my estimate as will repay me for the cost I am to incur. Give me a bill of quantities fairly guaranteed and I will tender from them at the lowest market price to which I can see my way, but impose other risks on me I must be recouped in some way for taking them. Is it then the surveyors who prepare the quantities who are benefited? In the name of a worthy profession in which I have toiled some thirty-five years, I protest against any such benefit being given to the surveyors. No surveyor of respectability would shield himself behind Her Majesty's Commissioners or anyone else in disclaiming professional liability for professional work done by him. As to the person tendering verifying the bills of quantities, this is simply "a mockery, a delusion, and a snare." Have Her Majesty's Commissioners any idea what is meant by verifying bills of quantities? Items appear in bills of quantities, say 500 rods of brickwork, and 10,000 feet of stone. Do Her Majesty's Commissioners suppose that those simple items are obtained *en bloc*? Do they know that these items are the results of some hundreds of items of calculations, each of which must be gone through before the total is obtained? Given then that the intention of the advertisement is not fraudulent, it is foolish and defeats its own ends. And the sooner other counsels prevail with Her Majesty's Commissioners the better it will be for the public, the builders tendering, the surveyors, and for common honesty. Mr. CATES suggested that the Surveyors' Institution should make a representation that an advertisement of the kind was not creditable to the department. Certainly a very proper suggestion, and one which it is to be hoped the committee of the Institution will bear in mind and carry out. With the object of eliminating risk as to the accuracy of bills of quantities both from the building owner and the builder, it is often suggested that the bills of quantities should form part of the contract. If the parties interested agree on this course who shall object? The owner pays for the work actually found to be done, and the builder gets paid at his own price. What can be fairer? And the surveyor, he gets paid for taking out the quantities and for measuring the work. Very nice for the surveyor, but perhaps the building owner is not as well pleased as the surveyor. But there are often real objections to this course. It introduces an element of uncertainty into the amount to be paid and received at the end of the work which is undesirable. There are many cases in which it is essential that the building owner should know the *extent* of his liability at the outset. This cannot be done when the amount to be paid is only definitely ascertained after the works are completed. If, after knowing the extent of his liability at the commencement of the work, the building owner, by himself or his architect, varies the works during their progress, he must bear the consequences of having unsettled the defined sum. From a surveyor's point of view, the making the bills of quantities part of the contract is objectionable, from its tendency to lower the standard of accurate bills of quantities. When it was known that the works were to be measured up when the building was completed, quantities would too often be taken out in a very perfunctory way, and the principal reason for employing an intelligent surveyor would disappear. Indeed, the very *raison d'être* for the employment of a surveyor who can prepare accurate bills of quantities from drawings, more or less complete, would be gone. When the bills of quantities are made part of the contract the detailed prices should remain wholly unknown to the architect until the work is completed. Unconscious bias will have its effect, and the builder may find himself doing unprofitable substituted work without the architect reflecting that he is doing the builder a wrong.

But to turn to the consideration of risk (14) part B, "inaccuracies of calculations," a much more serious risk than the outer world imagines. Who that has had to deal with priced detailed bills of quantities but has been startled by finding errors of large amount in moneying out the prices, in the casts of the columns, in the carrying forward the amounts

from one page to another? Rods of brickwork priced at pounds, moneyed out as shillings. "Tons" moneyed out as "hundredweights" *ad infinitum*. A gross blunder is perhaps detected after the tenders are opened, the fact of being so low leading to an examination. Then the builder has either to eat "humble pie," and ask to be relieved from the consequences of his error, or to take the work with certain loss staring him in the face. It may be said that these errors of calculation are the result of carelessness. Sometimes they are. Too often they arise from the great hurry in which estimates are often prepared; but many are the result of those accidents which will happen. Other inaccuracies arise from being misled as to local prices—specially the cost of carriage and haulage. These risks, however, the builder must take. Let him exercise all the care he can by himself and by his staff, he must sometimes suffer; but the more carefully the prices are affixed by the estimating clerk, and the more carefully the whole are moneyed out and efficiently checked, the less probability there will be of error and consequent loss or humiliation.

The list of risks attaching to builders might be extended beyond that given by Mr. RICKMAN; among which risk of "bad weather" would probably be the most important, for litigation when it arises is usually from some of the causes already enumerated, and is indeed rather an effect than a cause. It is much to be lamented, however, that there are so few competent arbitrators to be found among architects and surveyors. The result is to send many references to barristers, who from their training often make better arbitrators than architects and surveyors, who have a knowledge of the technical points in dispute, but lack sense to apply this knowledge to the general issues.

Let us now give some consideration to the risks of employers—"building owners" as they have been termed throughout this paper—and we will treat these risks *en masse*.

(To be continued.)

## PARIS NOTES.

THE Minister of Fine Arts has given orders for cleaning the fine mural paintings by Hippolyte Flandrin in the church of St.-Germain-des-Prés.

An exhibition and sale of works of art, to be contributed by artists of Brussels and Paris, is being organised for the benefit of the Belgian painter Gustave de Jonghe, who has been suddenly struck down by an incurable attack of paralysis, and has a wife with several young children unprovided for.

The exhibition of eighteenth-century art, lately held at the Georges Petit gallery in the Rue de Sèze, realised 60,000 frs., and this large sum has been handed over to the association known as the Œuvre des Amis de l'Enfance (Infants' Aid Society), for the benefit of which the exhibition was held.

The engineers of the department of the Seine have drawn up plans for the construction of a bridge across the Seine between Charenton and Ivry, just outside the city boundaries. The bridge will have a total length of 24 mètres, and will immediately connect the important Rue de Seine, on the left or Ivry bank, with the Avenue des Dames on the opposite side. The cost of the bridge, without taking into account the attendant road-making, is estimated at 1,050,000 frs. Its construction will prove a great boon to the Communes of Charenton and Ivry, for at present much of the traffic between these important suburbs has to be effected by the Pont National, which lies within the fortifications, and thus occasions endless octroi formalities in the case of all exciseable goods passing over it, and, unfortunately, this category includes nearly everything that can be imagined.

An association has been recently founded in Paris under the title of the *Société des Arts Parisiens*. The object of the society is the preservation of all monuments, either of historical or artistic value, within the city boundaries. Among the organising committee are to be found the names of MM. Cabanel, Guillaume, Bailly, Ballu, Delisle, Yvon, J. Claretie, Lenoir, Ch. Normand, &c. At the first meeting of the body just held at the Cercle St.-Simon in the Boulevard St.-Germain, the last named gentleman, who is

one of the Government architects, read a paper setting forth the character and programme of the Association, and appealing to the editors of the chief Parisian papers as well as to the senators, deputies and municipal councillors for their aid in the task of preserving the numerous artistic and archæological treasures of the French capital.

The erection of the plaster model of the great porch of Bordeaux Cathedral, at the Trocadéro Museum of Comparative Sculpture, is nearly finished. In the same room will shortly be arranged the library, plans, and collection bequeathed to the city of Paris by the late Viollet-le-Duc, which are stored for the present at the Cluny Museum. The equestrian statue of *Louis de Brézé*, whose tomb already forms part of the Trocadéro collection, will also be placed in the same gallery directly the casting, now in progress, is finished.

The Musée du Louvre has lately acquired some curious drawings by Etienne Liotard, a pupil of Massé, about the year 1725; and the Versailles Galleries have received additions in the following busts by contemporary sculptors:—Claude Bernard, by M. Iselin; Berryer, by M. Barre; Décamps, by M. Noël; Leverrier, by M. Leduc; Barnave, by M. Irroy; General Decaen, by M. Dumilâtre; Ponsard, by M. Salomon; David d'Angers, by his son; Duc, by M. Ch. Lenoir; Sainte-Beuve, by M. Mousnier; Houdon, by M. Iguel; Troyon, by M. Michel; Corot, by M. Vasselot; Barye, by M. Boucher; Daubigny, by M. Durand; Diaz, by M. Fourquet; Lemaire, by M. Hébert; Littré, by Mdle. Foivart; Latour-Dumoulin, by M. Salomon; Théophile Gautier, by M. Thomas; Valentin, by M. Bailly; Dufaure, by M. Barrias.

Mdlle. Rosa Bonheur is now, we are happy to learn, completely restored to health, and has returned to the Château de By. Everyone will, moreover, be delighted to know that the artist has expressed her intention of making up for lost time, and finishing off, as quickly as may be, the many paintings and studies of animal life that were already commenced when attacked by her late severe illness.

An important question of artistic copyright is now pending before the Paris Civil Court. A Paris tailor, named Godchau, is proprietor of a small publication, half newspaper and half advertisement sheet, called the *Chronique Parisienne*, in which items of town gossip figure side by side with trade puffs. For the engravings with which his paper is illustrated, M. Godchau recently took advantage of a sale of old blocks by the *Petit Journal* to purchase those of two well-known pictures by the military painter De Neuville, *The Reconnaissance* and *The Battle of Le Bourget*, which were obtained for the modest sum of 140frs. The engravings subsequently appeared in the *Chronique Parisienne* in company with portraits of gentlemen wearing the elegant coats or walking suits supplied by the Maison Godchau. M. Goupil, the art publisher, however, who possesses the exclusive privilege of reproducing De Neuville's works, looked on this publication as an infringement of his copyright, and has brought an action to obtain the suppression of the incriminated number of the *Chronique Parisienne*, and payment of damages. M. Godchau called into the action the proprietors of the *Petit Journal*, and the latter, on their side, brought in MM. Tolmer, the printers from whom they had purchased the engravings. Both parties argue that in selling the blocks they had only disposed of the material objects, and that it was for the purchaser to obtain from the holders of the copyright the authorisation to use them. The Court has deferred judgment for a fortnight.

Good prices were obtained at the Marquis d'Osmond sale on Saturday last. A Boule cabinet, that formed part of the furniture of the royal chamber at Versailles, and which was presented by the king to the Prince de Condé, was bought for the Duke of Northumberland for 45,000 frs. Two Louis XV. vases, with paintings and decoration after Boucher, brought 86,100 frs. from M. de Aylon, who also took a Louis XIV. jardinière for 59,100 frs. A pair of Louis XVI. vases, of cylindrical form, dark blue, painted by Boucher, were taken by M. Sichel for 65,000 frs.; while a single vase, of celadon green, only 18 inches high, was run up to 51,100 frs., at which price it was sold to M. Du Sartel. The day's sale produced 17,000.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE visiting season was opened on Saturday last by an excursion to the Canongate, in which about 70 members took part, under the guidance of Mr. John McLachlan, president. The excursionists were received in the hall of the Canongate, Tolbooth, by Mr. Skinner, town clerk, and by Mr. Robert Morham, city superintendent. The latter gentleman read a few notes, in which he explained that the building was one of the best examples of the pure Scottish Baronial style, and was erected during the reign of James VI., in 1591, as a species of town house or seat for the local Government of the Burgh of Canongate. The various alterations which the structure had undergone were detailed, and its present uses as a register office and police-station were explained. After a close inspection of the interior and exterior, Professor Baldwin Brown proposed a vote of thanks to Mr. Morham for his paper. The party thereafter proceeded to Moray House, where Mr. Maurice Paterson, the rector, met them, and exhibited prints of the house and grounds as originally executed and laid out. Mr. Andrew Kerr, late of Her Majesty's Office of Works, made a few remarks, in which he drew attention to the striking contrast between this building, erected in 1628 by Mary, Countess of Home, and the one just left. Seeing that the one building was erected as a prison and the other as a first-class residence, he made no comparison, but drew attention to the harmonious blending of Baronial Gothic and Italian, the entire absence of defensive arrangements, and the dissimilarity between it and other buildings erected in Edinburgh about the same period, which he explained by the fact of its founder being an Englishwoman in possession of considerable wealth, which enabled her to provide a comfortable residence in accordance with the ideas of the south. The interior is plain, except in the two principal rooms, where the ceilings are domed and panelled, the latter of which are filled in with beautifully designed plaster ornament, significant of much artistic power judiciously employed. It appears that the grounds as originally laid out were terraced, and contained a pleasure-house in which, it is said, the Treaty of Union was commenced to be signed. After detailing the illustrious tenants of the house, the speaker concluded by pointing out that in more modern times the building was used as the hall of the British Linen Banking Company, later as its counting-house, still later as a private residence, and now as a training school of the Free Church of Scotland. Mr. T. Croall having proposed a vote of thanks, a departure was made for Milton House, which was erected in the eighteenth century, and which, in one of its rooms, contains a wall decoration the work of a French artist named La Com. A visit was then paid to Queensberry House, regarding which Mr. John McLachlan read some notes, in which he enumerated the various occupants of the pile, and explained the several alterations which had been made in the building. He also noted that the rooms originally were decorated in a very ornate manner, and contained several richly carved marble chimney-pieces, which, on the dismantling of the house, were purchased by the Earl of Wemyss. After examining a few of the surrounding closes in a cursory manner, the proceedings terminated by an inspection of the curious house or lodge situated at the west corner of Holyrood Palace, known as Queen Mary's Bath, the history of which was explained by Mr. Kerr.

## CATHERINGTON CHURCH.

AT the meeting of the Society of Antiquaries, on February 7 (Mr. Franks, V.P., F.S.A., in the chair), a paper was read by Mr. B. Edmund Ferrey, F.S.A., entitled "Notes on the Parish Church of St. Catherine, Catherington, Hants." The lecturer commenced by describing the situation of the village on the chalk downs north of Havant, and how the tower of the church was a landmark to mariners on the Solent, so that in times of danger blue lights used to be burned at its summit. He proceeded to describe the plan of the Transition Norman church, with its nave and chancel of same width, with no chancel arch (but evidences of a rood-screen), its lean-to aisle roofs covered by a prolongation of the nave roof, and instanced the building as of a type not at all uncommon in the southern counties. Mr. Ferrey remarked on the situation of the tower at the south-west angle of the nave, with one arch opening into the nave, the other into the aisle, and spoke of the Hyde Chapel, which was a north aisle to the chancel. In the north wall of this chapel was a good thirteenth-century rear arch, nook-shafts and string. He described the nave arcade with its bold and beautiful mouldings, and explained that the south one was earlier than the north, and how the capitals of a foliated cushion-shape were much diversified. Chalk, he said, was the material used for dressings and quoins, the general material of the walls being flint. Catherington Church, which Mr. Ferrey said has just been extensively repaired and added to, had been in a very dilapidated condition, and it was during these works that some remarkable discoveries were made. Among them was mentioned the head, stem, and part of the base of the old Purbeck stone churchyard cross, of Transition Norman character. The head

was a canopied one, having the representation of the Crucifixion on one side, and the traces of a figure on the other. He drew attention to the rarity of such examples, as most of them had been destroyed. Two sepulchral slabs of late twelfth-century character with floriated crosses rudely incised were also found; also fragments of bases of piers, arch mouldings, &c., of good section, of the late Decorated or early Perpendicular period. On the north wall of the nave a tempera painting was discovered, which Mr. Ferrey considered dated from about the middle of the thirteenth century, but which Mr. Micklethwaite and Mr. Keyser—in the discussion which followed the reading of the paper—thought was early fourteenth-century work. The subject was St. Michael weighing Souls. Mr. Ferrey said the tall figure of the archangel was full of vigour. He wielded in his right hand an uplifted sword, typifying Justice. Instead of wearing armour, as usual in paintings of a later period, St. Michael was robed in a tunic (the sleeves of which were diapered) and was barefooted. A girdle was worn round the waist through which the yard of the scales was passed. The Blessed Virgin as a crowned figure, typifying Mercy, held the scales containing the saved souls, the other scales being filled with the lost ones. Mr. Ferrey described another painting which was on the east wall of the Hyde Chapel, evidently being a Trinita. It was enclosed in a pointed aureole. The Eternal Father, in the semblance of a bearded man and with nimbus, holds in his bosom the Crucified Son. The representation of the Holy Spirit is not now decipherable. On either side were figures of great beauty, of censuring angels kneeling, the surface of the wall behind being powdered. Beneath the Trinita were some elegant foliated enrichments. Above were formerly two figures of angels, one only of which now remains, bearing a harp; a musical instrument, probably a cithara, still existing on the other side. Around the splay of the circular window in the east gable of this chapel was some beautiful foliated ornamentation. Both the paintings were in a fair state of preservation, and of great value owing to their design. Mr. Ferrey went on to mention a monument of great interest in the Hyde Chapel, raised in 1631. It contained the recumbent effigies of Lord Chief Justice Hyde and his lady, the sculptured figures of their sons and daughters being represented kneeling in front of the tomb. Above was a lofty architectural composition. Mr. Ferrey proceeded to show that Lawrence Hyde, of the illustrious family of the Hydes of Hinton Daubnay, in this parish, was common ancestor of the Earls of Clarendon, Queen Mary, and Queen Anne. He said that the immediate vicinity of the church was associated with one of the later adventures of Charles II. before the Restoration, when he was so frequently a fugitive, and gave a summary from a curious and little-known MS. by Colonel Gounter, of Racton, which described it in quaint language. The king was concealed in a house near Catherington, and slept there the night before he managed to escape from Brighton by a boat to Normandy. The lecture was illustrated by drawings, most of which had been made on the spot for Mr. Ferrey by the kindness of the clerk of works, Mr. F. W. Mansel.

### A RARE COLLECTION OF GREEK ANTIQUITIES.

THE National Museum of Antiquities in the Royal Institution Edinburgh, has just received from Lady Ruthven a very important donation of an extensive and valuable collection of Grecian antiquities which has long been preserved at Winton Castle, and is well known to all the visitors of that interesting and hospitable mansion. The collection consists chiefly of Greek vases, terra-cottas, lamps, bronzes, and coins. The coins form in themselves a collection of great importance and interest, amounting to nearly 3,000 in number. They range from the earliest date B.C. to the time of the Roman Empire, and include most of the principal types of the coinage of the chief cities of Greece, Asia Minor, and the Mediterranean Isles. The bronzes include a number of mirrors of early Greek types, and a considerable variety of small statuettes and figures of animals from Greece and Italy, with portions of several specimens of large sepulchral vases of bronze of archaic character. The terra-cottas are for the most part archaic in type, including a number of painted figures of horses and other animals, presenting a suggestive resemblance to some of those recovered from the excavations at Mycenæ and the ruins in the Troad by Dr. Schliemann. The vases, which form the largest and most showy portion of the collection, are about 500 in number, some being of large size, and many of extreme beauty and rarity. They are mostly from early Greek tombs, and have, therefore, a peculiar interest in an anthropological sense, as well as a special value in connection with the illustration of the early history of art and culture in Eastern Europe. One vase of large size and globular form, ornamented with a painted border of laurel leaves, contained the burned bones of the occupant of the tomb, while others of smaller size, and many different varieties of shape and purpose, were deposited around the burial. Some of these are alabaster bottles of peculiarly graceful form, sometimes as much as 16 inches in length, intended for perfumed ointments.

But the great majority are vases of clay, finely made and beautifully decorated with painted patterns, figures of animals, or groups of figures representing mythological or heroic and legendary scenes and incidents. Their shapes are always extremely graceful, and though they present a wonderful variety of form, the principal types are readily distinguishable by their distinctive peculiarities of shape and outline. There is the *amphora*, or double-handled vase, with narrow neck and globular body tapering to the base; the *hydria*, or water-jar, of similar form, but with a flat roof and single-side handle; the *crater*, a large double-handled cup, with a spheroidal body and bell-shaped brim, used for mixing the wine and water for the banquet or for ceremonial libation; the *enochoe*, or wine-decanter, a jug-shaped vessel of extreme elegance, with trefoil-shaped mouth and handle rising gracefully above the brim; the *cylix*, a wide, shallow drinking-cup with a foot, and gracefully curved horizontal handles; the *cantharos*, a deep cup, also with a foot stalk, but with vertical handles; the *stamnos*, a broad jar shaped vessel, with a flat base and two vertical handles, usually furnished with a lid or cover; and the *lecythus*, of tall, cylindrical form, with a long narrow neck and single side handle attached. These sepulchral vases are found in the tombs of Greece proper and the Mediterranean Isles, and also in those of the Greek colonies of Magna Græcia, or Southern Italy and Sicily. It was formerly the belief of most writers that all the vases of this description found in Italy were Etruscan; but it is now known that the character of the true Etruscan pottery is totally different from that of these Greco-Italian vessels; and Jacquemart ascribes the introduction of the Greek style into Etruria to Demaratus of Corinth, who settled in Tarquinia about the year 655 B.C. In Greece, the graves in which these vases are found are usually small; but in Italy, the early Greek and Etruscan tombs are often massively constructed chambers, sometimes hewn in the solid rock, and magnificently furnished with articles of use and luxury. The number, size, and quality of the vases deposited with the burial, of course, varied with the circumstances of the individual. The ornamentation of these fragile vessels is the most peculiar feature of their character. The paste of which they are made is light and tender, often giving a body of extreme thinness, the glaze lustrous, and the colours fresh and harmonious. Millingen divides the period of the painted vases into three principal epochs—(1) The ancient style, from about 700 B.C. to 450 B.C.; (2) the fine style, from 450 B.C. to about 230 B.C.; and (3) the late style, from about 230 B.C. to the beginning of the Roman Empire. "Later than this," says Mr. Birch, "they could not have been made, for in the days of Augustus all the towns of Magna Græcia had relapsed into barbarism." It is evident that they had ceased to be made during the later days of the Roman Republic, if we judge from the fact that none are found in the ruins of Herculæum, Pompeii, or Stabiae. Splendid examples of all the styles are found in Lady Ruthven's collection. There is the archaic style, in which the whole vase is covered with chequers, meanders, and plain bars, or decorated in bands with repetitions of the figure of an animal drawn with a brush in a brownish-black on a reddish or reddish-yellow ground. Then there is the transitional style, with figures of men as well as animals, the figures still arranged in bands; the human forms tall, thin, and angular; the beards and noses pointed, the expression grotesque, and the whole figure coloured black. The fine style, representing the best period of the art, is shown by many excellent examples; the forms of the vessels exhibiting that perfect gracefulness of outline and proportion for which the Greek pottery is so famous, and the figures and drapery drawn and coloured with a spirit and skill which is peculiar to this period. Among the rarer varieties there are some vessels of peculiar shapes; and the variety of *lecythus*, which has the body coated with a white ground and the figures outlined with the utmost delicacy in a faint reddish-brown, is represented by a considerable number of beautiful examples. The black Nolan ware and the red lustrous ware, commonly called Samian, exhibit their peculiar varieties of shape and finish in considerable abundance. The number of lamps, on the other hand, is small, the lamp being a comparatively late form introduced in the time of the Roman Empire, and the bulk of the collection dating from times long anterior to the rise of Imperial Rome.

The *Scotsman* says it is understood that this magnificent collection would have been very acceptable to the British Museum, but, with characteristic patriotism, Lady Ruthven determined that it should not leave Scotland. Through her generous gift to the Scottish national collection, it now possesses a typical series of painted vases, second in importance and interest only to that of the British Museum itself. The value and importance of the donation are greatly enhanced by the fact that the collection was made during a lengthened residence in Greece and Italy, at a time when there were but few who took an interest in such pursuits, and ground had scarcely been broken in the prolific field which has since been so diligently worked by collectors of all nations.

Arrangements will be made, in the course of a week or two, for the display of the collection in the museum; but no satisfactory classification or exhibition of these treasures of ancient art can be attained in the present galleries, already crowded far beyond their capacity with other objects of antiquarian and historical interest.

## NOTES AND COMMENTS.

Two pertinent questions have been raised by Mr. RUSKIN in a letter which he wrote on Sunday last. He asks whether schools might not be instituted which should teach the rich and poor alike the arts of painting and music, and whether both these arts might not be occasionally practised by the women of England in modes beneficial to the public, yet not altogether dependent on its patronage? As regards music, it is taught in most cases without a view to patronage or the gaining of a living; but experience shows that where painting is taught, the end sought after is generally the acquisition of money. Why Mr. RUSKIN has not recognised this fact we are unable to understand. The explanation of the difference is very simple. A moderate amount of skill as a musician can always afford pleasure to others, but a corresponding degree of skill in painting or sculpture is of little advantage to anyone but the professor. Both rich and poor have opportunities to study painting, and before many years pass there will be schools for music, but as yet the line which divides rich and poor has not been effaced in the former, and it is likely to remain in the latter. Can Mr. RUSKIN devise a plan for teaching which all classes will be willing to recognise? Schools may be instituted, but who can compel the VERE DE VERES and their servants to sit on the same benches and copy the same models?

MR. RUSKIN'S museum at Walkley is now in the hands of the builders, and for several weeks to come visitors and students will be unable to enjoy the sight of the treasures which it enshrines. It will be remembered that Mr. RUSKIN lately appealed for aid towards the enlargement of the museum, in order that he might display his collection of casts from St. Mark's, Venice, and from some of the Gothic buildings of France. Whether the public have responded we are unable to tell, but a very small gallery, which resembles a conservatory in a third-rate London house, and a wing containing a few small rooms, are in course of erection. The house which was adapted by Mr. RUSKIN to a museum is of a commonplace type, and the additions are made to correspond. The agriculturists of the neighbourhood cannot understand how so plain a building can be called a museum, or be sought after by strangers. It is not to be inferred that the project for the removal of the museum to Sheffield has been abandoned. The funds for a new building in that grimy town have been guaranteed, but years must elapse before it is ready to receive Mr. RUSKIN'S gifts. Meanwhile it is better to allow the copies from Italian pictures and from TURNER'S water-colours, with Mr. RUSKIN'S elaborate studies of rocks and flowers, to be seen than to have them packed in cases as they have been hitherto. The additions are carried out with a rigid economy, and it is proposed to utilise the building hereafter for some educational purpose in connection with the St. George's guild.

MR. MADOX BROWN is daily engaged on his wall-paintings in the Manchester Town Hall, and at present he has in hand one which suggests the simple but efficient way in which the law as to Weights and Measures was put in force in the old days. The paintings which have been completed suggest how well the hall will appear when all the panels are filled in. The scheme of colour that has been employed in each case gives emphasis to the intervening piers, and the great hall will lose none of its effect. The only drawback is the contrast between the crude white in the statues, with which no colours can be assimilated. Mr. MADOX BROWN proposes to reproduce the series on a large scale by the autotype process, and as the paintings will give a poetic view of the history of Manchester from a remote age, the plates are sure to be prized in many Lancashire houses.

A LARGE number of men are daily employed in carrying out the building works at Cardiff Castle, which are under the immediate direction of Mr. FRAME, A.R.I.B.A. The plain wooden fence, dividing the castle grounds from the street, has long been considered an eyesore. It will shortly be removed and a costly boundary wall of original design be substituted. This is to consist of lengths of solid masonry and of open iron railing alternately; the latter allowing of a view of the lower

parts of the tower and other buildings. It is proposed to have figures of animals looking out over every section of the masonry—not heraldic figures, but various animals more or less ferocious, which will be copied from nature. In this way the exterior will be made to suggest the originality of the interior. Great care has been taken to preserve the sculpture and other decorations which were designed by the late Mr. BURGESS, and throughout the winter an heating apparatus with movable coils of piping is kept in every room, in order that the gilding and painting may not be affected by changes of temperature.

In the notice of the competition for the enlargement of Christ Church, Clifton, it was stated last week that Mr. JOHN NORTON had originally designed the church. That gentleman built the tower and spire only, as we stated in these columns December 28, 1878, when an interior and exterior were illustrated of the designs submitted. Mr. CHAS. HANSOM was not requested to undertake the work, but was invited to submit a design in competition, which was selected.

We trust that when the scheme for the new Admiralty and War Offices again comes before Parliament, an effort will be made to secure a worthy approach to St. James's Park from Charing Cross. From the Parliamentary papers on the subject it appears that Mr. MITFORD, the Secretary to the Commissioners of Works, has suggested the continuation of the Mall direct to Charing Cross, a change which would open a magnificent vista and lend itself in every way to imposing architectural effects. Of course additional property would have to be acquired by Government for the purpose. But the eternal want of pence that vexes public men again arises. Even so bold and unconventional a reformer of our city as Mr. LEFEVRE'S articles would show him to be, shrinks from the extra expense which this scheme would entail. So, as if the country were too poor to pay for its few great works, an incomplete and unsatisfactory scheme must be carried out, satisfying no one now, and assuredly irritating our descendants.

MR. WILLIAMS, one of the first-class surveyors in the Office of Works, has retired on a pension, having attained the age of sixty. For many years he was the only architect for Postal buildings throughout the country. His chief work was the new General Post Office West, at St. Martin's-le-Grand. We wish we could congratulate London and Mr. WILLIAMS on the work; but its exterior is condoned, we have been informed, by the interior, which is admirably arranged for its purpose.

THE successor of Mr. WILLIAMS is, we hear, Mr. HENRY TANNER, one of the younger school of architects—a gentleman favourably known already, even whilst a student, for the taste of his designs. Such an opportunity as the new General Post Office can come but seldom to an ambitious man; let us hope, however, that Mr. TANNER'S chance may be provided by the growing needs of the Government service, and, we must add, by the liberality of Parliament. Probably no civilised Government is more grudging than ours in its votes for works of architectural beauty.

THE annual distribution of prizes to the students of the Lincoln School of Art has just taken place, Mr. F. J. CLARKE, the Mayor, presiding. The accommodation for the art students of Lincoln has been for some time under consideration, and there is every likelihood that the necessary buildings will now be soon provided. The Corporation of Lincoln has already granted a site whereon the proposed schools may be built; and in his remarks on this subject the Mayor recounted the various steps that had been taken, adding that he hoped that in the course of a few days a deputation of the committee would visit Derby, Liverpool, and other towns, where schools of art had recently been built, so as to make themselves thoroughly conversant with their requirements, and so that they would be in a position to instruct their architect, and not have to ask their architect to instruct them. We presume that what the Mayor meant was this. That the committee, having by their inspection got to know something of the requirements of a school of art, they would be in a position not to obstruct their architect in his work.

NEW COUNTY CLUB-HOUSE AT BURY ST. EDMUNDS.

THIS building occupies an admirable central site at the corner of Abbeygate Street and Hatter Street, and it was finished and occupied in October of last year. There is an excellent basement in the chalk, formed out of the old cellars of the late premises which were burnt down. On the ground-floor, which is 6 feet above the pavement level, are reading-room, dining-room, staircase, hall, and vestibule, of good proportions and height, with business-room at the back. Kitchen and servants' offices are on the low-level ground-floor at the Hatter Street end. The first floor is devoted to the drawing-room, card-room, billiard-room 33 feet by 24 feet, and spacious landing and lavatories. On a mezzanine floor over the kitchen are some good bedrooms. There is an oak screen between the hall and vestibule, and the ceiling of the latter is arched and panelled in oak. The floor of the hall is in parquetry, laid by Mr. EBNER, and the rooms are fitted up with oak and walnut chimney-pieces designed by the architect, from whose designs also the whole of the joiner's work and other details have been executed. The fronts are in the best

part of the north aisle being of the latter date. Some parts of the south wall are probably old; but there are modern buttresses, windows, and facings, and this wall is considerably out of the perpendicular. The principal additions have taken place at the east end, where a new chancel (shown in the illustration) has been built, 27 feet long by 17 feet wide, and of good height. The roof is of oak, of single hammer-beam construction, elaborately wrought. The ends of the hammer-beams are finished with angels, and the cornice is enriched with angels, pateræ, and tracery. An organ chamber has been built on the south side, with temporary vestry on the north. The jambs of the windows in the sanctuary are carried down, forming sedilia and credence. The chancel arch is new, and richly carved on both sides with emblems of the Death, Passion, and Ascension of our Lord. The north aisle has been lengthened eastwards, and two stone arches and piers forming the commencement of the new arcades inserted. The choir fronts and clergy desks are in oak, enriched with emblematic carvings and tracery. The floor of the chancel and sanctuary are in mosaic, supplied and laid by Messrs. DIESPEKER & Co. The whole of the work has been carried out from the designs and under the superintendence of Mr. E. F. BISSHOPP, architect, of Ipswich.

COUNTY CLUB HOUSE, BURY ST. EDMUNDS.

Woolpit red brick, the rubbed and gauged moulded work being executed in BROWN'S Braintree bricks, executed from the architect's special designs. The accompanying illustration of the interior of the billiard-room was prepared by the architect for a member of the club. It is shown to be finished in oak, with painted walls and plaster ceiling. On the chimney-piece would be carvings characteristic of the four seasons, with busts of the QUEEN, Prince of WALES, and his eldest son; and beneath these an oil-painting representing a meet of the West Suffolk Hunt. Messrs. SAUNDERS & SONS, of Dedham, Essex, were the contractors, and they have executed the work in a highly creditable manner; the architect being Mr. E. F. BISSHOPP, of Ipswich.

ENLARGEMENT OF ST. MARY-LE-ELMS CHURCH, IPSWICH.

THIS church, after being closed for some months for enlargement, has just been reopened for Divine service. The church is of ancient origin, and contains the only piece of Norman work in Ipswich, namely, the arch and jambs to the inner door of the south porch. There are also some remarkably quaint hinges to the door, probably of the date of the fourteenth century. On the exterior of the porch are the remains of three mutilated canopied niches. The church has from time to time been considerably added to, principally in the sixteenth and seventeenth centuries, the brick tower and

Mr. GEORGE KENNEY, of Ipswich, was the general contractor, and he has well and carefully executed the work, with Mr. HARPHAM as mason. Messrs. GROOM & SON executed the wood carvings, and Mr. KINNELL the stone carving.

MAISON DE CAMPAGNE, TOURS.

THIS house is proposed to be erected at Tours for M. LESOURD. The general disposition of the rooms is from dimensions and suggestions supplied by the owner. The principal view is from the grand and *petit salon* overlooking the river. The tradesmen's entrance, kitchen, scullery, butler's pantry, pantry larder, wine and beer cellars, fuel and brushing rooms are in the basement. The ground floor is as shown, the principal rooms opening on to the verandah. The bedroom floor contains six bed and six dressing-rooms, communicating bath-room, &c.

The walls are not proposed to be constructed as shown in perspective, the only stone and brickwork being in the basement below the plinth; ground floor above the ground level to be of timber construction, formed of angle posts 9 inches by 9 inches, boarded on the outside, studded, lathed, and pricked up in the centre, and on the inside lath and plaster, with cavity between each, so as to resist the heat in summer and the cold in winter; the fittings to be of pitch

pine. The architect is Mr. H. STAPLEY, of 51 Wool Exchange, Coleman Street, E.C.

#### NORTH UNITED PRESBYTERIAN CHURCH, PERTH.

THIS church was built about five years ago for the leading United Presbyterian congregation in Perth. Its internal dimensions are 84 feet long by 56 feet wide, and it gives sitting accommodation for over 1,200 persons. The aim in designing it has been to provide a spacious building suited to the wants of the Presbyterian form of worship. From every seat an uninterrupted view of the preacher is obtained, and the acoustics of the building, which were the subject of careful study, are of the most satisfactory character. The central front of the interior, as shown by our illustration, is waggon-vaulted and ribbed in plaster, while the side compartments are covered with flat domes. The cost of the building was within 7,000/. The principal contractors were Messrs. CRAIG & AULD, Motherwell. The carving was by Mr. HARRY HEWS, of Exeter, and the glass by Messrs. ADAM & SMALL, of Glasgow. The architect was Mr. T. L. WATSON, of Glasgow.

#### DEANE CHURCH ROOF.

### ON COLOUR DECORATION.

By J. D. CRACE.

(Continued from page 95.)

PUTTING aside for separate consideration the question of mosaic decoration, it may not be amiss here to consider the treatment of the interior of domes or cupolas, often the culminating point of a grand decorative work. The sectional curves of cupolas, of course, vary infinitely, and the rules which should guide their decorative treatment must, therefore, of necessity be somewhat elastic. Nevertheless, one master-rule may be said to apply invariably. It is that the vertical section or contour must be expressed and explained by the decoration, whether in moulded surface or in colours. This expression may be made to assist or modify the actual curve, but in some form it is essential. Without it an appearance of distortion, or of instability, or of confusion, is almost inevitable.

The methods of explaining the interior contour are numerous, and their several employments may be suggested by the varying conditions of scale, light, proportion, or actual contour. In domes which vertically exceed the hemisphere, a vertical division into "sectors" is by far the most direct and satisfactory means of expressing the curve. The strongly-defined vertical rib or band offers to the eye the readiest means of traversing the surface upwards. The intervening spaces may then be subdivided simply or elaborately, by horizontal lines or by curved lines according to the further explanation or elaboration demanded.

One subordinate axiom as to this vertical division may be noted. It may be taken generally that the higher the curve of the dome, the more numerous should be the vertical lines. Thus a low flat dome may be divided by vertical bands into four parts or sections; but a high dome to receive a full expression needs to be divided into eight, twelve, sixteen, or more sections. The amount of horizontal division is generally far less important. Perhaps the explanation of this is that the eye perceives from the first that the horizontal section is circular, whereas the vertical section must always be unknown and demand explanation.

When the dome is altogether on a large scale, it is essential that the vertical lines be expressed with more strength than any others. They contribute immensely to constructive expression, and to that effect of nobility which is given by height.\* There are, of course, plenty of well-known examples in which no systematic division has been adopted. In some early domes, usually of rather low section, figures are placed vertically on the unbroken curved surface. In such cases it is not easy to forget the distortion of those figures which do not face the spectator. In other instances the surface is simply diapered with scroll or ornament. Of these I will presently say a word. In others, again (very few), figures or ornaments are arranged in horizontal bands or storeys, which may be considered as the least satisfactory of all arrangements; but it is common to all these arrangements that the spectator can

receive no impression of the contour or vertical section which it is in the very essence of the thing should impress him. Without the vertical expression all that noble effect of stability and lightness, of solid structure soaring upwards by its own growth, and with symmetrical perfection, is exchanged for uncertainty, and that curious mental demand for explanation which is a sure sign of defect in the artistic quality of architecture. It may be permitted the spectator of a great iron tubular bridge to "wonder how it is done"; for no sense of beauty is appealed to. But to the architect or his decorator the mere question is a severe criticism, if beauty has been his aim.

I have said that there are samples of domes in which the whole interior surface is merely diapered. It must, however, be noticed that if this diapering be such as, being set out upon geometrical lines, diminishes during its repetition upward, in strict proportion to the diminishing diameter of the dome, it does, in fact, partly answer the same end as the more obvious vertical lines. It is the mode of decoration most frequently adopted in the domes of Arabian architecture, and (if the dome be not very large) undoubtedly possesses a peculiar charm when aided by harmonious colouring—a charm partly due to a certain sense of mystery which pervades so much of Oriental art, and which powerfully affects the imagination. This influence, attained by geometrical forms and pure ornament, aided by colour alone, is very remarkable, and deserves careful investigation.

The staircase is another important feature in every house; and since its decorative treatment often presents difficulties, it seems desirable to consider how they may best be met. I speak now not of such staircases as are to be found in large mansions or in public buildings, where architectural effect has been possible and has been studied, but of those narrow or shapeless spaces which enclose the successive "flights" of the ordinary town house. In these one is confronted by the most irregularly-shaped wall surfaces, which usually succeed each other from ground floor to attic without break or definition. They are literally staircases, having walls "without form and void," overshadowed by a succession of equally shapeless raking soffits, with no expression of support, and unrelieved by so much as a moulding. This is obviously not encouraging ground for the decorator, who usually arranges the dado of despair, tints or papers the unmanageable polygons above it, and retires baffled. If he has been allowed to use a scrolling pattern in dismal greens, he has perhaps the happy consciousness that he has imparted an "art tone" to the house by his treatment of the staircase, up which the visitor gropes his way in a monotony of green fog. But this is "fashion," not "art."

Where it is practicable—and it is so in some of these staircases—it is very desirable to make a broad distinction of colouring between the lower and upper storeys, inserting a sort of string-course at the level of, perhaps, the first floor. This at once gives breadth and stability of appearance, and helps to counteract that effect of perpetual treadmill, which is so unpleasant in mounting an ordinary London staircase. Where it is not possible satisfactorily to effect this marked horizontal division, it is possible, and frequently advantageous, to adopt such a design of decoration or paper-hanging as admits of the repetition of horizontal lines at brief intervals. This was the one good feature of the old marbled papers in blocks, and which still leads people to assert that a staircase looks larger with a marbled paper, the sense of width being in fact due to the horizontal joints, not to the figure of the marble. Designers who have perceived this fact now produce patterns arranged on the same block system, and suitable for narrow staircases.

Where an open well-staircase exists, with stairs to the first or second floors only, and open wall above, much may be done with moderate use of colour in cornice and frieze to give a value to the whole. In such cases there should certainly be a well-defined frieze or string-course at the level at which the stairs cease.

The soffits of the stairs may often be advantageously panelled out with mouldings, but where they are the plain soffits of stone stairs this is not very readily managed, and one must then have recourse to colour. A very simple use of even coloured lines will often be of considerable value. Again, much may be done to relieve the meanness and monotony of a London staircase by making a sort of vestibule or separate feature of one of the principal landings, and concentrating there your richer colouring and ornamentation instead of frittering them away in dribbles over the whole.

The use of stained glass in one form or another has become so frequent for domestic purposes that it is no longer necessary to advocate it. Perhaps it is rather necessary to ask for discrimination in its use. It does not accord well with light tints of pure tones in the decoration; but with low tones, whether light or dark, and with deep rich tones of colour it may usually be adjusted harmoniously. There are, of course, some restrictions connected with style which it is well to observe, because no mind trained in the history of art can altogether shake off those impressions of fitness or incongruity which are the direct result of such training.

It is not my present purpose to go into the subject of colour harmonies, but rather to treat of the general laws and conditions which should influence the use of colour in decoration. It may not be out of place, therefore, to allude briefly to some of the unex-

\* The division of the interior of the dome of St. Peter's, and its expression by colour, may be quoted as an admirable example both for effect and simplicity. The interior dome of the Sorbonne at Paris is very similarly dealt with. That of the "Invalides" is divided into alternate plain and coffered "sectors," the latter each consisting of a single vertical row of diminishing coffers. The Chigi Chapel at Rome has a low cupola divided into wide and narrow panels alternately. The dome of San Francesco at Naples, like that of the Pantheon at Rome, is entirely divided into square "coffers," diminishing upwards; but both these have rather low sections.

pected difficulties which crop up in practical decoration. In the first place, to allow for the very astonishing differences between the colour as it appears on the palette, and when transferred to the surface of ceiling or wall requires a considerable practical apprenticeship. Even a very large experience is insufficient to prepare one for the strange and fantastic tricks of reflected light; and it must be borne in mind that all ceilings are, by day, lighted entirely by reflected light. Hence it makes all the difference in the world to your colours whether there be a pavement, or grass, or a gravel path immediately outside your windows. So does it whether your floor is ultimately to be covered by a dark carpet, or by, perhaps, a yellow matting, especially as you must know how to allow for either, since they cannot be laid down whilst your work is in progress. Your difficulties are, likewise, largely increased by the false shadows and reflections thrown on the ceiling by your scaffold. This is a fertile cause of mistakes in colouring, and I would especially warn you against a scaffolding which has been used by the plasterers, the whitened boards falsifying the light on your work to your ultimate embarrassment. On this account when any critical point in the work is reached for the decision of questions of colour a good large space should be cleared of scaffold-boards. A fall of snow compels a complete pause, so far as adjustment of colours is concerned, the conditions under which the light is reflected being rendered completely abnormal. It is but a few weeks ago that in some very simple work in London I found myself frequently at fault in one front room, and discovered that this difficulty was entirely due to red blinds drawn down in some windows of a house on the other side of the street; though by no means directly opposite they were at such an angle to the room at the hour of my visit as exactly to reflect direct rays of red-tinted light into my room. I have in former lectures spoken at length on the use of gilding in decoration, but cannot altogether pass it by here. Properly used it is most valuable, serving, as it does, several distinct purposes. It is valuable for explaining form, for lighting up surface ornament, for separating colours, and for the mellowing effect it has on all colouring. It gives the decorator a ready means of "emphasis," serving to carry the eye to the right points and along the right lines, even in the shadowed parts of the work, or where the colouring is deep enough to make emphasis of colour alone difficult. It should be borne in mind that gilding, to be successful, must be used boldly and with very defined purpose, because in some lights you will see the gilding when you cannot distinguish colours. Timid gilding, in meagre lines or detached patches, is always to be avoided. It has the same sort of effect as cheap finery, and is destructive of repose.

Gilding, properly used, even where very freely used, never looks tawdry or vulgar; and where you find an interior spoken of as vulgar or tawdry from over-gilding, you may depend upon it that it is less the quantity of gold than its being in the wrong places which has produced the effect.

Reverting, indeed, to the question of "emphasis" in decoration, whether by gilding or otherwise, I may say that nothing is more essential to the success of any decoration. Its absence or insufficiency make any arrangement of colour very much what writing is without punctuation, or what speeches are without aspirates. Just in the same way the use of purposeless and patchy gilding makes of a decoration much what misplaced aspirates make of a speech—an unintelligible and vulgar jargon.

The use of gold ground mosaic for the purposes of decoration is a subject in itself, and I will only briefly allude to it here. A magnificent material for work of a monumental character, it seems to me unfitted to use promiscuously or in small patches, and on the level of the eye. I venture to protest altogether against its use for pictorial purposes in the small panels of a reredos, for instance. It can only be used with really adequate effect on large surfaces free from mouldings. It is worth while to turn to Ruskin's "Stones of Venice," and read his remarks on incrustated decoration ("St. Mark's," pp. 23, 24), which are full of true artistic perception of fitness.

The use of natural products, such as wood or marble, as part of the colour scheme of any interior, is a very excellent thing, and has made great progress of late years, though I have known architects paint handsome oak balustrades white for fashion's sake. The decorator must, however, bear in mind that these natural colours are for the most part very quiet in tone, and that careful modulation of tone is necessary in all the painted ornament that is to harmonise with them. All woods (with rare exceptions) belong, in colour, to the "low tertiary" class; and pale bright tones do not readily harmonise with them, although colours may be so used with them as to appear pure and bright. Marbles are of purer tones than wood, and admit of a somewhat brighter scale. No natural material lends itself more favourably to decoration, the mottled and varied combinations of colour in many marbles being most helpful to the general harmony.

Mr. COLE A. ADAMS, the President, said that Mr. Crace had spoken from the valuable standpoint of experience. He was glad to find stress was laid on ceiling decoration; the more he thought of this form of decoration the more inclined he was to advocate it. Mr. Crace had spoken of certain difficulties from reflected light when working with colour; for instance, during a fall of

snow. He had seen a curious example of this in a billiard-room, the ceiling of which was a deep rich green colour spangled with stars, having the cornice red, picked out with black. When the billiard-table was in use the ceiling was more or less in gloom; but when the white cloth was thrown over the table an effect was produced like that of a transformation scene. The Chairman said that at a previous meeting several speakers had condemned the introduction of swags or festoons on flat surfaces, and he would like to know whether Mr. Crace considered such treatment legitimate. He differed with Mr. Crace as to the use of gilding. Gold might, he believed, be used with effect if sparingly introduced here and there in spots or points among flowers and foliage. The use of mosaic, as seen in reredoses and various other parts of churches, was, in his opinion, disappointing. According to the late Mr. Street, the proper use of mosaic was to employ it on a large scale and on lofty curved surfaces, such as on the interior of a dome.

Mr. H. H. STANNUS proposed a vote of thanks to Mr. Crace for his paper. That gentleman had pointed out that by emphasising the margin, the effect of height in the centre of the ceiling is obtained, and therefore the use of swags was allowable, as also where the effect of a barrel vault or a covered ceiling was to be produced. In fanciful decoration also it was allowable, and it was found in Pompeian and Roman work. He heartily agreed with the rules Mr. Crace had laid down for the treatment of cupolas; but for obvious reasons he would not enlarge on that point. He queried whether it was desirable to decorate a staircase at all, or, at any rate, to any degree that would take a person's attention away from minding his footsteps. Decoration should rather be confined to the landings.

Mr. A. B. PITE said he had always regarded colour as a sort of panacea of the architect's woes. In a utilitarian age when one was asked concerning everything, What is the use of it? colour was the one and only element in nature which had no objection attaching to it. Neither need an architect when using it fear district surveyors or the Metropolitan Board of Works. Colour was not to be studied simply in relation to architecture; they must go to nature for it. When told to study architecture from nature or the past, they required a guardian angel like Ruskin to direct their steps. But for colour they need not go abroad; colour was to be found in London, even in the gorgeous sunsets of late. Colour was regardless of form, so, if the architecture was bad, by all means let them prop it up with colour. Nature gave us colour that we might enjoy it, and enjoy it for its own sake alone, and disregardless of form. Mr. Pite remarked on the gorgeous blaze of colour seen in birds of paradise, parrots, &c., and observed that the stripes of the quagga did not follow the outlines of the animal's form and limbs. Nature had not treated its legs as pilasters.

Mr. J. G. CRACE, sen., said he entirely disagreed with the previous speaker that colour should be used independently of form. Colour could not fail to be incongruous unless in some degree it harmonised with the forms to be emphasised or delineated. Colour, indeed, when rightly used, was a grand thing. What music was to the ear, that colour was to the eye, and in our sooty atmosphere, where everything so soon became besmirched, colour gave a relief that nothing else could. He wished that colour were more commonly seen on ceilings. Houses would then be far and away more cheerful, but the ornament should be suited to the room, not inharmonious, heavy, or gross.

Mr. H. W. PRATT said he believed after what they had heard they would all carry away the idea that they could materially help the decorator by designing work with a view to its being decorated.

Mr. H. D. APPLETON thought it was impossible to lay down hard-and-fast rules for colour. There was a certain freedom about colour, so that individual likes and dislikes would always exercise considerable weight; and it seemed to him quite true of colour that what was one man's meat was another man's poison.

The vote of thanks was then put by the President to the meeting and carried by acclamation.

Mr. CRACE acknowledged the compliment, and, in reply to the observations passed by various speakers, first alluded to the use of festoons or swags on ceilings, and said he considered that, from the point of view taken by Mr. Stannus, that gentleman's answer was correct; but he qualified it to this extent, that in some cases the impression would be that of a slightly curved ceiling. All flat ceilings, as they receded, appeared to have the edge that was furthest removed from the eye lower than the centre, and for this reason the decoration must be designed in a precisely opposite direction to that followed when designing a carpet, and thus the edge of the ceiling furthest removed from one became the lowest edge in the artistic sense. As a rule, it was most disheartening to attempt to decorate the average London staircase, except on the landings. The most that could be done in the attempt was not to leave it worse than it was at starting. Without absolutely ornamenting it, some relief and some appearance of width and support might be given it. He did not read nature as Mr. Pite did, namely, that colour was disregarding of form. To take the example of the quagga and its stripes, the alternations of yellow and black were distributed very systematically, according to the conformation of limbs, length of body, &c. The limbs were not synonymous

with columns or pilasters, for they were moving things, and so colour was not applied to them in geometrical forms. Such forms would be absolutely unsuitable to columns which constantly changed their form. The colour consequently followed irregular outlines, which did not get broken up when the limbs of the animal were in motion. In the case of buildings these conditions were reversed. The colour treatment must be precisely opposite, for the first thing was to give buildings an appearance of immovable stability.

### ART AND ARCHITECTURE IN ENGLAND.

LORD WINDSOR on Friday in last week distributed the prizes to the students of the Bromsgrove School of Art. In addressing the students he reminded them of the importance of art schools, and what benefits there were from an art school in such a town as Bromsgrove. In England, he said, they had been sometimes accused of bad taste in decorative art; but that they were much behind other countries in that respect he doubted. That in foreign countries they found certain things more artistically done than in England was a fact; but he attributed that mainly, if not altogether, to the fact that in Italy, and in most of the other great European countries, they had got that copy which was so much better than we had in England. But copy was not invention, and, as far as inventive taste went, he did not think that England need be ashamed of herself. In England we could boast of some very fine buildings, but he thought the finest were the ancient ecclesiastical monuments, nearly all of the Gothic order. But however much the Gothic style of architecture was adapted to cathedrals and churches—and he thought the Gothic architecture was pre-eminent for that purpose—he did not think that Gothic details and Gothic decoration could be tacked on to the more homely style of decoration that was fitted for use in houses and edifices of smaller dimensions than cathedrals and churches. He then referred to the architectural beauties to be found in Italy, and said he thought that the style adopted in that country was the best for domestic purposes. In allusion to the great value of painting, he expressed his opinion that the study of landscape painting helped one to appreciate materially the beauties and varieties of nature. As to the position England now held in regard to painting, he believed that the English school was certainly better than the school of any other country at the present time.

### ARTISANS' DWELLINGS.

THE half-yearly report of the Improved Industrial Dwellings Company, Limited, has been issued, from which it appears that the company now possess thirty-three estates in various parts of the metropolis, on which 4,314 dwellings have been erected and are in occupation, and 640 are in course of erection, making a total of 4,954 tenements. When these are completed the number of persons residing in the company's dwellings will be about 25,000. The report states that the buildings at the City Road Estate were completed in September, and occupied early in October, the number of applications for the eighty-three dwellings having been 382, these dwellings being the first that have been completed by the company under "The Artisans and Labourers' Dwellings Act, 1875." The buildings in High Street, Islington, were completed in November, and occupied in December. For the eighty dwellings at this estate there were 323 applicants. The drawings and specifications for the Mint Street, Borough, Estate were not returned finally approved until October last, or fifteen months after they were first submitted to the Metropolitan Board of Works, and the directors at once put in hand the necessary preliminary work. When ready to proceed with the superstructure—the foundations, drains, and area walls having been nearly completed—a further and most serious difficulty arose by the Metropolitan Board of Works advertising their intention to apply to Parliament for an extension of time in respect of the new street from St. George's Church to Southwark Bridge Road, thus proposing to further defer the completion of the Board's obligation to the company, the Board having sold with the site a frontage to the new street. Proposals have been made to the Board in the matter; but the directors have in the meantime felt it necessary to stop the works, and are taking steps to protect the interests of the company. The buildings at the new street in Soho are proceeding satisfactorily, and it is hoped that the estate will be completed within the time stipulated in the agreement. The directors have acquired from the Metropolitan Board of Works the site referred to in the concluding paragraph of their last report. This consists of nearly an acre of freehold land in Linton Street between Carlisle Street and Edgware Road, close to the Edgware Road Station of the Metropolitan Railway, and only a few minutes' walk from Oxford Street. Plans have been prepared and provisionally approved for the accommodation of about 700 persons. The site is in the centre of a densely-crowded locality, and is one that was acquired by the Metropolitan Board of Works under the Artisans and Labourers' Dwellings Act, 1875.

### THE CENTRAL INSTITUTION.

THE Central Institution of the City and Guilds of London Institute in the Exhibition Road, South Kensington, is now approaching completion, and the Executive Committee are proceeding to appoint, in the first instance, four professors to the chairs of chemistry, of engineering, of physics, and of mechanics and mathematics respectively. The salary attached to each professorship will be 1,000*l.* per annum, with a prospect of increase depending upon the number of students in attendance. It is expected that the appointments will be made during the next few weeks. The council of the Institute, at the request of the Duke of Buckingham and Chandos, have consented to lend, during the summer months, and pending the preparation of the fittings, a portion of the Central Institution to the Commissioners of the International Health Exhibition for the display of appliances for scientific and technical instruction, and of the work done in technical schools here and abroad.

### MURAL PAINTING.\*

IT has been thought by some that the paintings discovered in the excavations at Pompeii and elsewhere are evidence that the ancients were in possession of a process that would insure the permanence of paintings for some two thousand years at least, and doubt was thrown, therefore, for a time, on the possibility of their being fresco-work. But recent examination, while it has proved their claims to be classed among genuine fresco-paintings, has also explained the seeming mystery of their permanent qualities. In the first place, it must be borne in mind that they have been preserved from the action of air and light, and in some degree at least of damp also, for almost the whole of their existence; and in the next place, their apparently indestructible character has vanished before those simple tests to which fresco-painting has invariably succumbed. All such paintings as have been, since their excavation, exposed to the action of the weather have undergone rapid decay; so much so, indeed, that within the short space of nine years some of them have almost entirely disappeared. Most, if not all, of the modern substitutes for fresco, such as wax colour, casein as employed abroad, do not profess to be capable of resisting the influence of weather when exposed to the open air. Mr. Gambier Parry's process of "spirit fresco" appears to contain merits beyond such methods as are employed abroad, but, like them, it is not intended for exposure to the open air.

The process, which it is my privilege to introduce to your notice this evening, is based on the stereo-chrome process of Schlotthauer and Fuchs, differing however from that in such important particulars as to constitute, practically, an entirely new process of itself. In the year 1818, Professor Schlotthauer, of the Munich Academy, who had for some time been engaged in experiments with a view to discovering some permanent process for mural paintings, turned his attention to the substance known as water-glass (silicate of sodium), the invention of the chemist Fuchs. The result was the adoption of the stereo-chrome process. In this process the surface to be painted on consisted of an ordinary mortar of lime and sand, impregnated with water-glass. Upon this surface the painting was executed in water-colour, and was then fixed by water-glass thrown against the surface in the form of a fine spray, the water-glass in this case forming the fixative for the painting. In practice, it soon became evident that a simple spraying of water-glass, applied to heterogeneous pigments, without reference to their peculiar properties as regards chemical composition, cohesive capability, &c., was not sufficient to insure their permanence. Certain colours in particular, as ultramarine, umber, and black, were observed to be always the first to detach themselves, in the form of powder, or by scaling off from the painting, thus pointing to the fact that their destruction was not owing to any accidental defect in the manner of their application, but to some radical unsuitability arising from the chemical conditions of the process.

In Mr. Keim's process great regard is paid in the first instance to the ground upon which the painting is to be executed. A careful study of the best examples of the fresco paintings of former times convinced him that the painting ground was a feature of supreme importance. I have here some fragments of Pompeian wall-paintings, which will illustrate the extreme care which was bestowed at that time upon the preparation of the wall surface. An examination of them shows that two different qualities of mortar, in distinct layers, were employed in their construction. That which lay underneath is coarser in texture, but very firm, and evenly mixed. Upon this is laid a very thin coating of a much finer composition, spread over the surface with the greatest care and accuracy. Here is a fragment of a Roman fresco, from Bavaria, of a much later date. The different character of the

\* Extracted from a paper read by the Rev. J. A. Rivington, M.A., at the meeting of the Society of Arts, February 13 entitled "A New Process for Producing Permanent Mural Paintings, invented by Adolf Keim, of Munich."

mortar can be seen at a glance. There is only one coating, and that not only far coarser than even the first coating of the Pompeian fresco grounds, but very roughly and carelessly mixed. No trouble appears to have been taken to sift the sand so as to produce evenness of texture, as is evident by the presence of small stones and lumps occurring throughout. The deterioration of character in the later specimen is very marked. In Mr. Keim's process great care is taken that the wall to be treated contains no damp or decaying stones or bricks, and the latter must have been sufficiently baked, otherwise they will develop an efflorescence most injurious to the process. If the wall be already covered with stucco or mortar, this will serve as the first ground, provided it be in a thoroughly sound and dry condition, and it will then be sufficient to clean and level it before applying the second, or painting ground. If not, the stucco must be cleared off, the bricks laid bare, and the mortar between the bricks picked out to a depth of about three-quarters of an inch. This more thorough preparation is always preferable in a work of greater importance, or where special pains are advisable to secure durability, as, for instance, when undertaking the exterior decoration of a building. Upon this surface a thin squirting is cast, composed of the following mortar:—Coarse quartz sand, infusorial earth, and powdered marble, mixed in certain proportions. Of this mixture four parts are taken to one part of quicklime, slaked with distilled water. Upon this squirting-cast, the object of which is to secure adhesion to the surface of the wall, follows mortar of ordinary consistency, composed of the same ingredients, to fill up all inequalities and produce a smooth surface, and upon this again the second or painting ground is applied. The painting ground is composed of the finest white quartz sand, marble sand artificially prepared and free from dust, marble meal, and calcined fossil meal (infusorial earth). The sand composed of these materials, carefully mixed in the proper proportions, is mixed with quicklime slaked with parts of distilled water, in the proportion of eight parts sand to one part slaked lime. This mortar is applied to the wall as thin as possible, not exceeding one-eighth to one-quarter inch in depth.

For work executed on the exterior of buildings, Mr. Keim recommends the employment of pumice sand in addition to the other ingredients of the mortar. When coated with a stucco of this composition the wall presents so hard a surface as to admit of sparks being struck from it with a steel. It is absolutely essential that throughout the work only distilled or filtered rain-water be employed. The reason for this is to obviate any possibility of the water containing lime, as that would affect the solution employed for fixing so as to impair the effect of the painting. The intense power of increased durability which Mr. Keim obtains by these improvements can be best estimated by a regard to the fact that paintings executed by the stereo-chrome process, while they have for the most part lost the coating of paint or their colour, have, save in such cases where the preparation has been carelessly carried out, retained the painting ground up to the present day, after exposure to weather for nearly forty years, in perfect and sound preservation.

When the mortar is perfectly dry, down to the stone or brick of the wall, it is treated to a solution of hydro-fluo-silicic acid, to remove the thin crust of crystalline carbonate of lime which has formed on the surface, and thus to open the pores. It is then soaked with two applications of potash water-glass (silicate of potassium) diluted with distilled water, and when dry the ground will be found hard, but perfectly absorbent, and ready for painting. The surface layer of mortar, or painting ground, can be prepared in various degrees of coarseness of grain to suit the artist's requirements. The more smooth and polished, however, the surface is made, the greater are the difficulties in the subsequent process of fixing, owing to the absorbent qualities of such a ground being necessarily less perfect. The ground can also be prepared in any tint or colour that may be desired, and can be applied to any suitable substance, if needed for a removable decoration. Stone, tile, slate, wire-gauze, glass, and canvas form an efficient substitute for the wall in such cases. If applied to canvas, it can in this form be fixed to wood-panels, mill-board, ceilings, &c., and admits of being rolled with perfect safety. The advantage of this to the artist is sufficiently obvious. If a ceiling, for instance, has to be decorated by this process, it can be painted with the same convenience as an ordinary picture in the studio. After it is fixed, it can be rolled up, taken to its destination, and fastened on to the ceiling, either temporarily or permanently, at the cost of very little expenditure of time or labour. Similarly (unless it were permanently fastened up), the ceiling would admit of being removed for the purpose of being cleaned.

I come now to speak of the colours used in this process. Certain pigments only are admissible, in order to insure permanence, and regard must be had to the purity of these, and to their absolute freedom from adulteration. All the colours found available for the stereo-chrome process can be employed; these are, for the most part, composed of natural earths or metallic oxides, since experience has proved that the most permanent colours are those derived from such sources. In their preparation, due account has been taken of the well-known law in optics, which teaches that colour does not lie in the substances themselves, but in the rays of light, which are divided, reflected, or absorbed by the substances in such a manner as to produce the effect of colour upon the eye.

Substances, therefore, which readily undergo change, whether by reason of their affinity to other substances with which they are brought into contact, or by the action of the light itself, which often causes molecular change, must, whenever such change takes place, lose, or modify their original colour, since, under their altered conditions, they absorb or reflect the rays of light in a different manner. Each pigment should remain chemically unaffected by the substance of the painting ground on which it is laid, and by the substance of any other pigment employed, as well as by that of the material used for fixing them. To meet this end, the colours in this process are treated beforehand with alkaline solutions (of potash or ammonia), to anticipate any change of hue which might result from the use of the alkaline liquids which form the fixative. In addition to this, they are further prepared with certain other substances, such as oxide of zinc, carbonate of baryta, felspar, powdered glass, &c., as required by the peculiar properties of each, in order to obviate any other danger of chemical change taking place.

The colours found available present a very full scale. They are thirty-eight in number, and there are several other colours which could be added if required. They consist, speaking in general terms, of four varieties of white, six of ochre, two of sienna, ten of red, two of brown umber, two of Naples yellow, two of ultramarine, five of green, three of black, and cobalt blue. Cadmium will shortly be added to them. The whites are, perhaps, in unnecessary profusion. Zinc white for its opaque qualities, and baryta white for purposes where great opacity is not desirable, would be probably found quite enough in practice. From the various nature of the properties possessed by some of the pigments, it was found that their capacity for absorbing the alkaline silicate with which they were fixed varied very greatly. There was also a marked difference in the degree of mechanical cohesive capacity which they respectively possessed. To equalise them in these respects, without which the fixing would have been a work of great difficulty and uncertainty, alumina, magnesia, and hydrate of silica were added as required. The result was, that all the colours are equally acted upon by the fixing solution, and all attain an equal degree of durability after fixing, both as regards the mechanical and chemical action of this process upon them. In the year 1878, a large mural painting was executed by this process on the exterior of the parish church at Eichelberg, near Regensburg. Before its completion, and therefore before any of the fixing solution had been applied to it, it was drenched by a heavy storm of rain. Contrary to anticipation, it was found that the painting, so far from being in any degree washed away, had held perfectly firm, and even in some places seemed to be as hard as if already fixed. Mr. Keim's explanation of this unexpected result, which he subsequently confirmed by experiments, was that a chemical cohesion had already taken place by the action of the alkali, set free in the mortar, upon the silicates in the pigments. Again, when it was determined to execute the mural paintings in the Franciscan monastery at Lechfeld, in 1879, it was desired to wash off a painting executed in this process a year previously, which had never been fixed. Neither water nor even a tolerably strong solution of acetic acid had the slightest effect upon it.

If the process appear to be somewhat of a complicated character, the reverse is the case as regards the use of this process from the artist's point of view. For him are no complications or difficulties whatever. So far from approaching in any degree the difficulties or inconveniences possessed to a greater or smaller extent by fresco-painting, or any of its more modern substitutes, this process is even far pleasanter and easier to work in than oils or water-colours. Every variety of treatment is possible, and it adapts itself to any individual style of painting. It presents perfect facility for transparent glazing as a water-colour, and for painting in body colour it even surpasses the capabilities of oil colours in its power of opaque treatment.

Moreover, the most delicate tints, when laid over darker tones, do not in the slightest degree darken over them, as they are apt to do in oils, but keep their full value perfectly. Retouching and correction can be effected with the greatest ease, and to an almost unlimited extent. The system admits also of great economy. To begin with, the pigments are by no means expensive, in spite of the labour expended on their preparation, and a very sparing use of them is sufficient to meet all possible requirements in painting, a far less amount requiring to be expended than in other processes. This is due mainly to their being ground so exceedingly fine, so that they need only be very thinly laid on; in fact, this consideration has always to be borne in mind, that the thinner the coat of painting is the greater the degree of security that can be attained by the fixing. Moreover, there need be no waste of pigment at the end of the day's work, as in oils. The palettes employed for the process, as you see by the one before you, are constructed with small pans to hold the pigments. If any paint remains after the work is finished, it can either be replaced in the bottle, or it can be kept moist in the pan with distilled water for the next day's work. Even if a considerable amount of the pigment should, by inadvertence, have been allowed to become dry, all that need be done is to grind it up again with a little distilled water, a task involving no labour.

The last stage in the process is the work of fixing. In the stereo-chrome process the fixing medium employed was silicate of potash, thoroughly saturated with silica, in combination with sufficient sodic silicate to prevent it from opalescing. The chief defect of this lay in the fact that it was often apt to produce spots upon the painting. Mr. Keim has substituted silicate of potash treated with caustic ammonia and caustic potash. The action of the carbonic acid in the atmosphere and in the water during the process leads to the formation of carbonated alkali, which makes its way to the surface, and would form, when dry, a whitish film over the painting. To obviate this danger, as well as to expedite the process of converting the silicate of potash with the basic oxides existing in the substance of the painting into silicate, the fixing solution is heated further with carbonate of ammonia. The effect of this upon silicate of potash is that silica is precipitated in a fine gelatinous form, and ammonia set free. This latter volatilises, and carbonate of potash is formed, which is easily removed by washing after the completion of the fixing.

The fixing solution is employed hot, with the advantage of obtaining a quicker and more perfect formation of silicate than was possible in the stereo-chrome process, where the solution was applied cold. The effect of the fixative as it sinks into the ground, which has already absorbed the pigments, is to convert the painting into a veritable casting, uniting with colours and ground in one hard homogeneous mass of artificial stone. The finished painting has proved itself impervious to all tests. It will admit of any acid, even in a concentrated form, being poured over it (save, of course, hydrofluoric acid). Caustic potash, also, has no effect upon it, indeed nothing can be employed with greater advantage than this for cleansing the painting when its condition requires that process. In Munich a specimen of the process was subjected to incessant tests, and put to every form of torture without intermission for two years, and I may say, in language which, if not classical, is at least familiar to English ears, it "came up smiling" after each attack, and, at the end, was as fresh and uninjured as at the beginning.

Although this process has been designed to meet the requirements of mural paintings, it is capable of application to other purposes with great advantage. For instance, it would have great merit in its durable qualities, and in the readiness with which it can be cleaned, for scene-painting; in addition to which it possesses the important advantage of being unflammable, owing to the presence of the silicate. For ordinary house-painting, it would last as long as the building itself, only needing to be scrubbed down from time to time. I need scarcely point out that it would, when used for this purpose, be an effectual protection against damp. It can also be employed for tapestry painting. It might, perhaps, be feared that such exceptional qualities could only be taken advantage of at a prohibitive cost, but this is not the case. The expense will bear favourable comparison with that of other systems, without taking into full account the lasting nature of the work executed. It only remains for me to add the testimony of a commission appointed in the spring of 1882 by the Royal Bavarian Academy, at Munich, to examine into and report on this process. The members of the commission consisted of Professors Lindenschmit, Müller, and Max, artists; Albert Schmidt and Fritz Hasselmann, architects; and Dr. Lietzenmayer, chemist. The chemical report says:—"Mineral painting guarantees with certainty that, by means of this process, mural paintings can be executed, which—presupposing a correct and conscientious treatment—are capable of the greatest and most enduring resistance to climate."

The architects conclude as follows:—"The evident hardness and capability of resistance presented by the specimens laid before us, as well as the fact that, amongst others, Professor Lindenschmit has buried one such painting a whole winter under a roof-gutter in the snow without its having received the slightest damage, leave no doubt that Mr. Keim has, through his very able method, succeeded in perfectly solving the problem of producing mural paintings indestructible by weather."

The artists on the commission sum up their report with these remarks:—"According to the foregoing opinions, Mr. Keim has undoubtedly succeeded in providing a method of monumental painting, carefully thought out, even to the smallest detail, grounded on scientific principles, and practically verified by visible facts, which is by far to be preferred to all methods of painting hitherto existent, and which, once recognised for its high value, would bring about a complete revolution in all our monumental and decorative art, and which deserves the widest publication and practical employment."

**The Royal Meteorological Society.**—At its ordinary meeting to be held, by permission of the Council of the Institution of Civil Engineers, at 25 Great George Street, Westminster, on Wednesday next, papers will be read on "The Great Storm of January 26, 1884," by Mr. William Marriott; on "The Height of the Neutral Plane of Pressure, and Depth of Monsoon Currents in India," by Prof. E. D. Archibald; and on "The Sunrises and Sunsets of November and December 1883, and January 1884," by the Hon. F. A. Rollo Russell.

## SANITARY INSPECTION BILL.

A MORE thorough supervision of the sanitary arrangements of buildings is advocated by Mr. Monckton, M.P. In a Bill introduced by him into the House of Commons, he proposes to direct every local authority to appoint sanitary inspectors for this purpose, the appointments being subject to the confirmation of the Local Government Board. To these officers are to be submitted the plans of any new building as regards the position of the drains, traps, closets, refuse receptacles, water cisterns, ventilating openings, and all other sanitary appliances. These plans are to be kept by the local authority for the purpose of future reference—an advantage to be appreciated by numerous householders who at present have no notion of the geography of their drains. In passing these plans the inspector is to be guided by certain rules. For instance, he must see that the foundation is dry and a damp-proof course provided. The drains must be of adequate size, laid with a proper fall and disconnected by a ventilating manhole or trap from the main sewer, and must have their connections properly made. There must be no direct communication of the drains with the interior of the house. The soil-pipe must be efficiently ventilated and brought down outside the building, without any outlet in proximity to any opening into the building. The closets and refuse receptacles must be in proper situations, well ventilated, of proper construction, and adapted to any scavenging arrangements that may be in force in the district. All waste pipes from sinks, &c., must discharge in the open air near, but not directly over gullies outside the house. All water cisterns must be properly constructed and conveniently situate for examination and cleaning. Openings from the external air must be provided into all rooms, and below the joists of the ground-floor for the sake of ventilation. Not only is the officer to inspect the building during its erection, but once every year he is to inspect every building existing in his district, and whatever deficiencies he notices the local authority is charged to require the owner or occupier to supply. From his decision, however, an appeal is allowed as in the Public Health Act. The expenses of the inspectors, as well as the cost of alterations to place buildings in a proper sanitary condition, including those of opening the drains for inspection, are to be paid by the owners of the property; but any damage done by the inspection is to be defrayed by the local authority. The Bill is backed by the Marquis of Stafford, Mr. H. T. Davenport, and Mr. H. H. Fowler.

### French Architectural Organisation.

SIR,—The writer of the article on "French Architectural Organisation," commenting on the paper read by Mr. White at the last meeting of the Institute, and the ensuing discussion thereon, has drawn an imaginary picture of the termination of the life of a *grand prix* architect which is very far from being correct. After noting that in the course of his career he arrives at very great honour, receives academical titles, enrolment in the *Légion d'honneur*, and membership of the Institute itself, he completes the last paragraph but one with the following phrase:—"When he dies—probably in the lonely *appartement* of a bachelor—he has speeches delivered over his grave lauding his merits to the skies of Père-la-Chaise as the designer of a single edifice and the wearer of a dozen decorations. May he rest in peace!"

In the following and last paragraph he asks "whether a prosperous architectural practitioner in England, supporting a large and happy household, will envy all this, and be anxious to surrender what he has for what he has not?"

The picture was drawn from some remarks on the career of a distinguished French architect (now dead) which I made in the discussion. It must not be supposed, however, that it is the fate of all *grand prix* men to die in the lonely *appartement* of a bachelor. I happen to know personally nine *grand prix* architects, all of whom are married men. The writer of the article seems to have forgotten that they "manage these things better in France," and a *grand prix* architect, on his return from Rome, and of the age of thirty to thirty-four, with an immediate appointment as *architecte-en-chef* of some important public building, or, if of a palace, with residence as well, and future honours in store for him, is also a *grand prix* in the matrimonial market, and his relatives undertake at once to arrange a marriage for him with some young lady provided with a suitable dowry. Every prudent French father considers it his duty to provide a dowry for his daughter. *Une belle fille avec 20,000 à 100,000 francs de dot* is not to be altogether despised, and if it doubles or trebles the nominal salary of 10,000 to 20,000 francs of the aspirant to matrimonial life, there is wherewithal to commence *ménage* at once.

With respect to the second quotation, French families, it is well known, are not *large*, though they may be *happy*, households, and the French *grand prix* architect, with one or two children

only, is able to live in a comparatively small *appartement*, and, so long as he educates the one child and provides a dowry for the other, can afford to devote much more time and personal labour to the elevation of one or more great public buildings during his lifetime (with such *temporary* assistance from *inspecteurs* and clerks as is necessary for routine work) than an English architect cares or is willing to give up when he is assisted by a regular staff of clerks and articulated pupils.

I am, yours faithfully,  
R. PHÉNÉ SPIERS.

#### Excavations at Chester.

SIR,—I notice in your issue of February 9, in a paragraph on the excavations now being made at Chester, a statement to the effect that "the antiquarians of Manchester, Liverpool, and Chester are now co-operating" in a search in the Dean's field for Roman remains.

Permit me to state that the excavations are the result of an arrangement made between the Dean and myself in August last, and the cost of the excavations so far has been borne by the Lancashire and Cheshire Antiquarian Society (headquarters Manchester) and their friends. It is much to be wished that the Chester Archaeological Society would co-operate, but so far they have held aloof.

I remain, sir, your obedient servant,  
W. THOMPSON WATKIN.

242 West Derby Road, Liverpool :  
February 12, 1884.

#### Building Risks.

SIR,—No doubt the paper by Mr. Rickman, lately read at the Institute of Surveyors, may be turned to good account by almost every one practically connected with building operations. It is a thoughtful and instructive essay, and may be taken as the outcome of a large and varied experience; and it gives outspoken expression to conscientious convictions based on a veteran's dealing with the subject-matter in hand. Young architects will do well to read it carefully and think about its every sentence, whereby they may profit through a whole lifetime. Older men it may remind of the sources of right-dealing, and at the same time throw light upon disappointments which they may never have fathomed before. Yet it is to be borne in mind that all which has been set forth in the paper is confessedly "from a surveyor's point of view," and it is just within the range of possibility that even surveyors may not be without a tinge of idiosyncrasy. Whether this class of view is absolutely right in respect of all the parties concerned in a building operation each experienced expert must settle for himself. It is to be seriously noted, however, that the foundation, as it would appear, of all Mr. Rickman's conclusions is that a building proprietor cannot relieve himself of all the responsibilities which attach to his position as such. If this be the case, no wonder that so many avoid having anything to do with bricks and mortar, and the old adage, "Fools build and wise men buy," may be fully accredited. But it may be asked—Will it be admitted all round that a building proprietor cannot either morally or legally contract a riddance of all and every risk attached to a site and a building? In the majority of cases, where the circumstances are of an ordinary character, it may be truly said that common experience negatives this proposition. Is it to be understood that an architect cannot under any circumstances assure his client with certainty that he may regard a contract sum as the full extent of his liability? If not, it might be reasonably said that no contract was ever completed within the agreed amount; but the experience of all careful architects—Mr. Rickman included—must be contrary to this. Of course there are exceptional cases where incidents transpire that could not, by any amount of foresight or forethought, be provided against. The writer remembers a contract for the construction of a gas-tank, when, after proceeding with the necessary excavations to a certain depth the workmen found themselves suddenly in the midst of an old coal-mine, and the difficulty and cost of securing a sufficient foundation and a watertight tank were enormous, yet the lawyers on both sides held that the contract was to erect the tank, and that it must be performed, and finally so it was; but, as may be imagined, not without considerable loss to the contractor. Still his legal advisers did not see their way to a maintainable claim for extras. This was an extreme case; but it was within procurable knowledge that mining operations had formerly been carried on at the site, and the question is, Whose duty was it to ascertain the facts? Did this lie with the Gas Company, their engineer, or with the contractor? The "sporting clause" set forth that the contractor was to complete the work not merely according to drawings, but absolutely. The party to the other side of the bargain naturally looked to him to do it. Even in such a case it would seem to be the duty of the engineer to uphold the contract. Mr. Rickman, by his dictum that a building proprietor cannot rid himself of all risks, notwithstanding clauses to the contrary, would mulct the proprietor for contingencies which belong to the expert. The above, as has been said, is an extreme case, but the principle of it applies generally. If it were to be admitted that a building

proprietor cannot, as is suggested, relieve himself of all risks in ordinary cases under contract with experienced experts, no one could be reasonably advised to enter upon building operations.

Yours truly,  
C. L.

#### WORKS IN PROGRESS.

**Ventilation of Public Buildings.**—Messrs. Robert Boyle & Son, of 64 Holborn Viaduct and Glasgow, have recently applied their system of ventilation to the new Prince's Theatre, Coventry Street; Grosvenor Club, Chester; Constitutional Club, Exeter; Her Majesty's Prison, Dartmoor; Her Majesty's Prison, Derby; New Fever Hospital, Birmingham; Christ's Hospital, Hertford; Military Barracks, Bombay; Local Offices, Gateshead; New Audit Offices, North-Eastern Railway, Newcastle-on-Tyne; and Post Office, Newcastle-on-Tyne.

**Stratford-on-Avon.**—The new hospital which is being erected at a cost of between 6,000*l.* and 7,000*l.*, the gift of Mr. and Miss Gibbins, of Ettington, is nearly completed, and the building will be opened early in May. A handsome clock has been fixed in the turret by the well-known firm of Messrs. Gillett & Bland, of Croydon. There are three dials, which are illuminated at night, and each one measures 4 feet in diameter.

**Messrs. Le Grand & Sutcliffe**, 100 Bunhill Row, the proprietors of the "Abyssinian" Tube Wells, will shortly commence an additional artesian tube well at Messrs. Truman, Hanbury & Buxton's Brewery, Burton-on-Trent. The same engineers have already commenced a 300 feet boring for a large brick manufactory at Pitsea, in Essex. The first portion of the work consists in sinking and steining a 100-feet shaft, from the bottom of which the boring will be continued for a further 300 feet if necessary.

**Messrs. C. Isler & Co.**, 88 Southwark Street, S.E., are completing the test borings for foundation levels for the new pier for the London, Chatham, and Dover Railway, on the foreshore at Gravesend; and recently the same firm completed a 2-inch tube well of 71 feet deep on the Saltings at Grays, and obtained at that depth a supply of fresh water.

**Messrs. Godwin & Son**, Lugwardine Works, Hereford, have just supplied tile pavements for St. Peter's Church, De Beauvoir Square, Kingsland, N., and St. Peter's Church, Ruthin; also the Callow Church, near Hereford, and St. Margaret's Church, Mountain Ash, giving in each case great satisfaction. They have also received the order for the tile pavements at the Yorkshire College, Leeds, Mr. A. Waterhouse, A.R.A., architect.

**Birmingham.**—A company has been formed to acquire possession of the Hen and Chickens Hotel property, New Street, Birmingham, and convert it into an arcade from New Street to Worcester Street, with the result of opening up a new and useful thoroughfare; which will relieve the often congested traffic at Worcester Street corner, and of utilising to the utmost the extensive premises extending back from the present hotel frontage. The New Street end of the arcade being near the terminus of several lines of omnibuses, it is expected that the traffic through the projected arcade will be considerable. The secretary is Mr. W. T. Smedley, and the architect is Mr. J. A. Cossins.

**The Proposed New Baths at Pendleton.**—The public baths for the district of Pendleton, for which the Salford Corporation have accepted tenders, are the second instalment of a series of four intended to be built by the Corporation, the first being those in Blackfriars Street, which have been in working operation for some time. The Baths Committee invited three firms of architects to submit designs in competition, and the plans of Mr. Lawrence Booth, Manchester, were selected. The contractors for the construction of the building are Messrs. Robert Neill & Sons, and for the engineering (which includes the provision of washing machinery, drying stove, slipper baths, &c.) Messrs. Thomas Bradford & Co., Crescent Works, Salford. Building operations are to be commenced forthwith, in the expectation of an early completion. The second-class plunge bath is to be 75 feet by 27 feet, and the first class 44 feet by 25 feet. There will be balconies around three sides of the former. There are twenty-five slipper baths for men and twelve for ladies. There are also vapour baths, foot baths, diving stages, dressing rooms, and all the usual conveniences. The building will be so arranged as to allow ladies to use the plunge baths. A commodious residence is to be provided for the superintendent over the ticket office and entrances.

**Stained Glass.**—Messrs. Ward & Hughes, of Frith Street, Soho Square, will shortly place a stained glass window on the north side of Selby Abbey church. Hambleton church, Selby, has recently been beautified by the erection of three stained glass windows, the gift of Mrs. Smith, of Hambleton House, Selby, which have been executed by the same firm.

**The Electric Light in the House of Commons.**—From the Easter recess to the close of the Session last autumn, the libraries and dining-rooms of the House of Commons were lighted by about

270 Edison incandescent lamps. The lighting having been entirely successful, some extension of it was deemed desirable by the First Commissioner of Works, and accordingly additional plant has been recently laid down by the Edison and Swan Company, and the total number of lamps is now increased to about 480. The machinery is located in a portion of the basement of the House adjoining the boiler-room, and consists of two  $3\frac{1}{2}$ -inch by 10-inch Armington & Sims's horizontal high-speed engines, running at about 300 revolutions per minute, the one engine driving two Edison 250-light dynamos, and the other two 150-light dynamos. The electrical arrangements admit of any circuit being operated by any dynamo, and as each pair of dynamos is run in multiple arc (that is, each dynamo of the pair performs half the work done by the two together), it will be seen that ample provision has been made against any failure of the light from accident to the engines or machines. The distribution of the lamps is as follows:—Dining-rooms, libraries, &c., 276; under galleries in the house—pilaster lamps, 32; division lobbies—table lamps 24, pendants 32, staircases 4; south entrance lobby and staircases, 13; north lobby, 8; ministerial rooms, lavatories, &c., 16; retiring-rooms, &c., 40; reporters' rooms, 21; reading-room, 12; total, 478 lamps. The existing gas fixtures have in several instances been utilised for the incandescent lamps by means of ornamental attachments in harmony with the character of the chandeliers. In other cases polished brass pendants, brackets, &c., fitted with opalescent shades have been provided. The electric wires are throughout entirely concealed from view, being either carried behind the panelling or encased in mouldings stained to the colour of the surrounding woodwork. The lamps are arranged on a considerable number of separate circuits, each capable of being lighted or extinguished by its proper switch. In a small apartment immediately under the floor of the House about twenty of these circuits converge on a switch-board, and can be controlled by the attendant who possesses the key to the switches. Each switch is surmounted by a double-pole safety fuse, and each circuit is lettered. In no part of the House will the electric light prove a greater boon than in the rooms set apart for the use of the gallery reporters, which have hitherto, owing to their contracted nature, suffered from a highly vitiated atmosphere. The whole of the work in connection with the installation of the light has been carried out under the superintendence of Mr. T. O. Belshaw, of the Edison and Swan Company, Mr. Prim supervising the arrangements on behalf of the Office of Works.

### CHURCH BUILDING AND RESTORATION.

**Badsey.**—At a meeting on Saturday last of the parishioners of Badsey, three miles from Evesham, the plans of Mr. Graham Jackson, for the complete restoration of the parish church and tower, were adopted, and a subscription list announced amounting to 950*l*. The church, which is much decayed, is partly in Early English and partly sixteenth-century style.

**Maldstone.**—At a meeting of the Dealtry Memorial Committee, plans prepared by Mr. Pearson, R.A., for the restoration of All Saints Church were considered. The scheme will involve the expenditure of a large sum of money, and it was decided that the Memorial Fund should be devoted to the restoration of the nave roof. The Rev. E. F. Dyke announced that, if the whole of the proposed work were undertaken, the Messrs. Hollingworth would contribute 2,000*l*. towards the cost. Immediately it is known what part the Ecclesiastical Commissioners will take in the restoration of the chancel, an effort will be made, entirely apart from the Memorial Fund, to raise the amount required for a suitable and complete restoration of the fabric of the church.

**Habton.**—A new church, dedicated to St. Chad, has been opened at Habton, near Malton. The cost of the new church has, in a great measure, been defrayed by a lady of the district. The building is in the Gothic style, the architect being Mr. Fowler, of Durham.

**Seascale.**—In consequence of the iron church at Seascale having been blown down during the recent storm, a public meeting has been held to determine what course should be pursued with regard to the erection of a new church at this rising watering-place. It was finally determined to procure a site for a permanent church to be built, and a church committee was appointed to collect subscriptions, make the necessary arrangements, and to select from their number a building committee.

**A Report** of the Board of Trade issued on Saturday last states that the total number of bills deposited for the session of 1884 which relate to railways, canals, tramways, and the supply of gas and water amounts to 227, against 221 of the session of 1883; the total amount of money proposed to be raised is 67,280,666*l*., against 94,342,749*l*., or a decrease in that proposed to be raised in the session of 1884, as compared with the bills of the session of 1883, of 27,062,083*l*.. They are made up in this manner:—Railways and canals, 149 bills, and proposed capital 60,968,195*l*.; tramways, 30, proposed capital 3,747,910*l*.; gas, 18, capital 590,411*l*.; water, 30, capital 1,974,150*l*.

### GENERAL.

**A Proposal** has been made to present the Bishop of Worcester with a portrait of himself, to be painted by Mr. Ogless, R.A.

**The Exhibition** of the Royal Scottish Academy at Edinburgh will be opened to the public to-day (Saturday).

**The Royal Scottish Academy**, at a general meeting held on Monday, elected Mr. William Beattie Brown, A.R.S.A., to the rank of Academician.

**An Art School** is to be erected in the town of Redditch in combination with a literary and scientific institute. Over 1,200*l*. of the 2,000*l*. required for the erection was promised at a meeting just held to promote the scheme.

**Mr. Arthur B. Plummer, A.R.I.B.A.**, of Newcastle-on-Tyne, has been appointed the architect for extensive additions which are to be made to the Lunatic Asylum at Coxlodge.

**The Prussian Landtag** have voted an extraordinary grant of 2,000,000 marks for the increase of the collections in the Royal Museums in Berlin.

**Mr. J. Earnshaw** has been commissioned to prepare designs for new parish-room at Christ Church, Bridlington Quay.

**The Marlborough Town Council** have made an order for the payment of 284*l*. to Mr. Ponting, architect, for preparing plans for building a new town hall, a project which has now been abandoned.

**Mr. John O. Scott** has received a commission to design a canopy for a recumbent figure of the late Primate, which it has been finally decided to place in the north-east transept of Canterbury Cathedral.

**Mr. Flavel**, the Mayor of Leamington, has announced his intention of presenting to that town a stained glass window for the Council Chamber of the new municipal buildings. The window will represent the Forest of Arden, with Shakespeare as the central subject.

**An Exhibition of Portraiture** is proposed to be held in Edinburgh during the present year, in accordance with a suggestion made by the donor of 10,000*l*. towards the formation of a national portrait gallery, and with a view of stimulating public interest in the proposed national gallery.

**At the Birmingham Architectural Association** on Tuesday evening, a paper was read by Mr. J. Spencer Swann on "The Influence of Literature on Art."

**The Designs** of Mr. D. Arkell, of Birmingham, have been selected in competition for the proposed Volunteer Drill Hall at Wolverhampton.

**When Planting Trees** last week around the new fort constructed outside the Porta San Lorenzo, Rome, a fine statue of Apollo, 1 metre 80 centimetres in height, was discovered, in a good state of preservation, and perfect with the exception of the right hand and the left forearm.

**Messrs. Thomas Robinson & Son, Limited**, Rochdale, have received a gold medal for their exhibits of wood-working machinery, steam engine, and boiler, at the Calcutta Exhibition.

**The Rumour** which was current last year that Clement's Inn had been sold is now confirmed, and that the quaint old Inn has been disposed of for 50,000*l*. to a private speculator.

**At the Metropolitan Board of Works** meeting on Friday in last week, the deputy-chairman stated that the Board had spent 4,600,000*l*. upon the main drainage of the metropolis, and were constructing relief lines and sewers which would cost an additional sum of 1,500,000*l*.

**The Liverpool Corporation** have authorised the issue of stock to the amount of two millions sterling, to pay debts falling due in the present year, and for the extension of public works—among the latter the purchase of "insanitary property" and the provision of improved dwellings for artisans. The city owes nearly six millions, but the revenues leave a surplus of 70,000*l*. over the annual charge of the debt.

**The Constitutional Club**, which is to be built on the vacant plot of ground adjoining the Grand Hotel, Charing Cross, is now proceeding apace, and when completed next year will be one of the most commodious and handsome club-houses in Europe. In size and splendour it will exceed that of the Carlton, containing as it will 120 bedrooms for the use of its members. The entire cost will not fall far short of 160,000*l*.

**Mr. J. P. Seddon**, in his address at the Parkes Museum of Hygiene on Tuesday, said that Dr. Angus Smith had described the air in some crowded theatres as being more foul than that in the street sewers. Theatres being highly heated acted as pumps to extract the foul gases from the drains below. The proper and only system to adopt was that of ventilation, by which an ample quantity of tempered fresh air could be forced into all parts of the buildings, with secondary provision for the extraction of foul air where it was generated. What was wanted was that managers of theatres should realise the paramount necessity for their proper and thorough ventilation, and that they should instruct their architects to have some efficient and complete system carried out.

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 16, 1884.

### TENDERS, ETC.

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* \* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TO AMERICAN SUBSCRIBERS.

All subscriptions are payable one year in advance, and may commence at any date.

The cost of one year's subscription, mailed free, is 20s. sterling per annum, and Post Office Orders for that amount can be obtained at any Post Office in the United States.

Post Office Orders should be made payable at Lombard Street Post Office, London, but SHOULD BE ADDRESSED TO GILBERT WOOD, 175 Strand, W.C., London, England.

In order to meet the difficulty which constantly arises from subscribers in the United States omitting to advise the Publishing Office at the time they remit a Post Office Order for the amount of their Subscriptions, and also as a reply to frequent inquiries as to the best means of obtaining THE ARCHITECT in America, the Publisher desires to offer the following suggestions:—

To prevent the possibility of delay, and to enable the Post Office Order to be the more readily traced in the event of its miscarriage in transit, it is advisable in all cases to notify per following mail, the number, date, and location of the order.

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

On pages preceding and following matter, special rates.

Public Companies' Advertisements, 12s. 12s. per page; 1s. per line.

Special arrangement may be made for a series of insertions on application at the Office, 175 Strand, London, W.C.

### COMPETITIONS OPEN.

ABERDEEN.—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macquene, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will receive a Premium of £50.

BLOEMFONTEIN.—Mar. 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

# LINDSAY'S

## IMPROVED PATENT REVERSIBLE TREADS & LANDINGS

### FOR EVERY DESCRIPTION OF STAIRCASE.

THIS Patent is an improvement on the well-known wooden block construction, and its speciality is that the wooden blocks in each Tread can be removed and transposed so many times that it is almost indestructible besides being noiseless.

No. 3.—Section of Tread showing Iron Risers.

No. 6.—Sect. of Worn Stone Step nosed with Patent Tread.

No. 8.—Section of Tread reversed, the worn portion underneath, and new face presented for traffic. In this case the original level is maintained by iron grids that fit into the channels on the underside.

In Hospitals, or places where it is desirable to be free from dust, the blocks can be placed close together, not leaving any cracks, so that the treads or landings can be swept or washed quite clean; also, if it be necessary to get light under a Staircase or Landing, rough glass blocks can be fitted in the Iron frames, side by side with the wood, and a subdued light thus obtained.

Each Tread is so constructed that the wooden blocks of which it is composed can be removed by taking off the brass or iron nosing of the tray, so that when the outer edge of the wood is worn, the blocks can be taken from the front and those next the riser (which will be quite intact) substituted. The worn blocks, after being reversed, are slid into the position next the riser. This at once gives the tread the appearance of being quite new, and ready for prolonged wear. When in their turn the nosing blocks again become worn, the same operation can be effected by transposing the unused blocks from the sides of the tread to the front, and so on until all are in turn utilised. Finally, when in the course of years the wood is worn out, the trays can be re-filled at a very small cost; and if they should not require entire re-filling, can be re-nosed with new blocks for a few pence. Skilled labour is not required in removing or transposing the blocks. These advantages are so obvious that remark is superfluous, and the many years the Wooden-block Treads have proved their efficiency, places the durability of this construction beyond doubt. It has already been adopted by some of the leading Architects and Engineers. The Patentee generally uses Oak, Elm, or Teak, in these Treads, but, if an exceptionally durable Staircase is required, employs "Jarrah" (an Australian mahogany of extreme hardness), samples of which will be sent on application.

The Trays which contain the wooden blocks can be made of either wood or cast iron, the latter being, of course, superior. In either case they are in themselves complete, and only require wood or iron stringers to make a finished staircase. If necessary they can be constructed with strong lugs to build into wall, and fix like ordinary stone steps, only being less than one quarter the weight. In this case the balusters are fixed in sockets cast on the outer edge of trays. Particulars to be obtained from the Patentee, at the Works,

# The Architect.

## LONDON GROUND RENTS.

THE subject selected for the Cantor Lectures this year at the Society of Arts is one of perennial importance, and the lecturer is a gentleman who can always secure the attention of a popular audience. Mr. R. W. EDIS, F.S.A., delivered the first discourse of three upon "The Building of London Houses" at the well-known hall in the Adelphi, on Monday evening, and dealt with their "arrangements, aspect, and design." We need scarcely say that there were a good many questions touched upon in which the general public, as distinguished from the building world, might fairly be expected to exhibit an appreciative interest; and this expectation was fully realised.

At an early stage of his lecture, Mr. EDIS, with his accustomed energy, fell foul of an abuse—as most people think it to be, and as his audience unmistakably did—which is worthy of being more thoroughly discussed than it usually has been, namely, the domination of "ground landlords" over their so-called tenants. It is no stretch of language to designate this kind of landlordism, whatever it may be in theory, as in practice a mere survival of the unfittest from the times of mediæval feudalism. Any stick, they say, is good enough to beat a dog with; and any excuse or affectation or shallow pretence is good enough to be made the basis of that personal proprietorial ascendancy which human nature so dearly loves on one side of the hedge, and so bitterly hates on the other. How long it is to last we do not pretend to say, but we live in an age in which, almost within sight of St. Paul's, it is lawful for a squire to let a few acres of pleasant land to an unsuspecting "cockney" whereon he may spend his money freely, and then to "eat him up," as poor CETEWAYO would have said, although not with soldiery with vermin for "sport," as resolutely as if he paid no rent or taxes or tithes, but were a squatter on the waste without leave or license. So also we need not be at all surprised when we find the same squire, or his cousin-german, happening to be the inheritor of some of the soil of London town, half a century ago his ancestor's garden or paddock, so possessed with a sense of his duty to his order that he looks upon the "tenants," who have built their houses upon his "estate," costing him not a penny, but making him rich with their ground rents, as in reality retainers rather than customers, whose duty therefore is, to pay of course, but much more to obey. The leasehold system of tenure, Mr. EDIS very truly says, is carried a great deal too far in London. To bring the case into the form of half a dozen words, he would deal with it upon something like the principle of the Irish Land Act. Every London ground-tenant, he says, ought to have by law the right to redeem his house by paying off the ground landlord at a reasonable price: and it can scarcely be doubted that the equity of the idea will commend itself to every unsophisticated mind.

When it is remembered (although we do not by any means desire to be either before the age or behind it) that the landed property of every man in England, when beyond his own power of protection, is protected for his enjoyment by the power of the community, it surely follows that in great towns, where the value of land is so entirely an artificial product of public enterprise, the conditions of its tenure ought to be adjusted to this artificiality. In other words, when a range of London houses, accessible from a thoroughfare maintained as public property, has been wholly built by the public individually for their own use and disposal, why should the owner of the ground, besides receiving the "unearned increment" which a ground rent so very peculiarly and liberally represents, claim the restoration of his land at the end of a certain term of years, *with the houses upon it*, and those houses every one put especially into repair for his particular benefit? And why, again, upon the strength of this arrangement so difficult to be accounted for, should the land-owner throughout the intervening time assert himself as owner of the whole property and lord and master of the occupants?

In law, of course, the answer is plain. Such is the contract. In valuation the answer is almost equally plain. Looked at from the date of commencement, the reversion at the then remote date of surrender is of so small a proportional value as to be not worth the tenant's keeping, and only worth the landlord's reserving because in this country landlordship is a permanent institution and tenantry a transitory one. But in spite of both law and valuation, it cannot but be seen that there is a grave practical inconvenience involved, and that indeed the benefit to the landlord class, whatever it may be, is secured at a great waste to the people at large, in respect of that freedom to do what they please with their own which, in house property, is of more palpable importance than in almost any other description of capital. The mere recognition of landlordship, and the conditions for arbitrary consent, are simply prohibitive to a great degree of that progression with the times which is the very basis of commercial prosperity, that free trade which in building property can no more be judiciously tampered with than in any other goods. Mr. EDIS, and many others besides, would correct the evil by this very easy and equitable remedy—that the property of the ground owner shall be his *rent* and not his *land*, and that the house owner may redeem this at his pleasure.

## EXHIBITION OF THE SCOTTISH ACADEMY.

THE interest with which the annual exhibitions of the Scottish Academy are looked forward to in Edinburgh is again justified by the high character of many of the works on view. Some of the best, it is true, are not now seen in public for the first time; indeed, it is an agreeable feature of these exhibitions that pictures which have recently drawn the public attention elsewhere are readily accepted in a small number for the benefit no less of the rising generation of Scottish students than of the community at large. Those who are already familiar with such pictures as MILLAIS's portrait of HOOK or PETTIE's *Monmouth prostrate before James II.* may, if they care, pass on to others; meantime, the many to whom these and some other pictures are still new will rejoice in their opportunity. HERKOMER's portrait of FORBES, "the correspondent," hangs staringly among its neighbours, as it did in London, and is a source of considerable attraction. His drawing of RUSKIN does not gain by being seen repeatedly. ORCHARDSON contributes only a small picture of two nuns, drawn in profile side by side, as if they were passing along a cloister, severe and simple in their demeanour and white costume. All that firmness of drawing, explicitness of modelling, and careful colouring can do is done to carry out the finely simple conception. Curiously, PETTIE also contributes a somewhat kindred subject in his portrait of *A Westminster Scholar*, drawn in profile on a small scale, and presenting a three-quarter length. For the Dutch modelling conspicuous in his *James II.* we have here necessarily the softness of a youthful face, yet it is a type of youth which lends itself well to his forcible manner. His *Young Laird*, on the other hand, is a picture in the full sense, duly combining open air and human nature with a simple incident instructive of the manners of a past age. ALMA TADEMA sends two small classic subjects—a *Torch Dance* and *In the Tepidarium*—the latter representing a Roman lady (*i.e.*, an English model), recumbent and nude, in the full enjoyment of the warmth of the tepidarium, and surrounded by luxurious objects of rich colour. The *Torch Dance* is the more attractive of the two, more original in conception, and more completely a true picture. Mr. JAMES ARCHER has a large canvas of *Peter the Hermit Preaching the First Crusade*. It is a work of great ambition, abounding in technical skill and judgment; but, on the whole, too much in the manner of Sir F. LEIGHTON, and with too little of original inspiration.

Of the painters resident still in Edinburgh Mr. GEORGE HAY seems to have passed under the same influence as that which partly shaped the style of ORCHARDSON in the matter of drawing, colour, and choice of subjects illustrating the more agreeable manners of old times. But though his outlines and modelling are firm and decisive and his colouring picturesque, yet he can hardly be said to be completely master of his task in the present exhibition. In his group of old Jacobite gentlemen toasting the king "o'er the water," there is more awkwardness in the attitudes than is necessary; at all events there is enough to render the figures ungainly. This applies also to his *Escaped*, and there is the more unpleasant because of the

attractiveness of the central figure of the richly-clad leader, who arrives within the house in time to find the person he seeks escaped. Between this central figure and his attendants in the background there is surely more disparity of scale and finish than was necessary to throw him well forward in the eyes of the spectator. Sir W. FETTES DOUGLAS is this year seen to advantage in his two very characteristic pictures of *Hudibras* and *Ralph Visiting the Astrologer*, and the *Antiquary Entertaining Lovel* in his study with an account of how he came by a rare volume. The room is of course strewn with old books in fine bindings and other curious objects. Pleasant humour at the expense of an amiable folly, as in this case, demands a peculiar talent, and it may be said that this painter has seldom surpassed the workmanship here. He has not equalled it in the other picture of the *Astrologer*, though there also his talent is at home to a considerable extent among the jars, phials, globes, books, and antique furniture of a capricious taste. ALEXANDER FRASER has made a limited experiment of a not altogether different kind in his *Queen Mary's Room in Holyrood*; but though he has brought to the task a broader treatment, he has nevertheless shown that in such interiors it is not always breadth that tells best. Fortunately he has sent also several landscapes characterised by his usual poetic feeling and mastery of simple open air scenes, where the face of nature is bright and the traces of men more or less humble, as for example in his *Canty Bay and the Bass*. Much honoured also among the landscape painters is SMART, among whose six pictures may be mentioned his *Pass of Brander* and his *Afternoon Clouds in Glen Dochart*, the latter lovely and tender. Mr. MCKAY's *Spring Day on Ancrum Common* tastes delightfully of the gorse in bloom and the sun warm, while yet the air comes clear and crisp from the hills with their lingering patches of snow. The sudden warmth of spring is finely rendered, and is driven home, so to speak, by the tinker recumbent in the foreground, while his horse, unyoked, wanders on the common. Mr. G. W. JOHNSTONE's *Yon Burnside* is rich in fine feeling, though the effect is not quite so instantaneous as could be expected, perhaps owing to the marked contrast between the seared wintry trees in the upper part of the picture and the tender green of early spring with its few rather primroses in the lower part of it. DAVID MURRAY, always a generous contributor, sends among other landscapes a bold experiment in his *Haymaking in the Scottish Fens, Lochwinnoch*, with lurid light reflected on the clouds and across the watery fields. It is an unnatural effect, and the picture, however clever, has an artificial aspect, which in the circumstances could hardly be avoided. McTAGGART, as usual, is represented by several examples of his fine resources of colour and his contempt for drawing, unless, indeed, in his portrait of R. B. FINLAY, Q.C., where something of the kind could not well be dispensed with. His drawing of *After the Storm* is really annoying in its neglect of form, but it is more pardonable there than in his *May Morning*, a subject which, as he conceives it, really demands a considerable sense of form. LAWTON WINGATE sends a very good *Orchard in Blossom*; but his best work of the year is, we think, his *Loading Hay*, in which, apart from the style of the whole composition, the horse is painted with the touch of a master. Indeed, the whole feeling of this picture is poetic and refined to a degree worthy of the high technical skill.

HUGH CAMERON enjoys a position almost, if not entirely, unique among the Scottish painters of simple domestic scenes in more or less humble interiors. It would be hard to imagine anything more poetic or perfect of its kind than his *Mother's Kiss*, or, better still, his *Trusted*, in which a young mother, in her plain cottage room, entrusts with grave injunctions her infant to the arms of a little girl, whose pride in the undertaking is as manifest as the anxiety of the mother. The touching simplicity of the scene has been met by a rare excellence in the treatment. From a higher class of life is his *Grandmother* amusing an infant on her knee. It also is a most welcome production of this gifted artist. Among the works of the rising generation who have taken so far to simple indoor subjects, not a few are of decided promise. We may mention, for instance, Miss ALICE GRAY's *Handloom Weaver*, in which the subject is very skilfully conceived and well rendered. The interior with a *Woman Spinning* is considerably less talented.

In portraiture the exhibition is marked by excellence in some of its examples, and by strong defects in others. Mr. IRVINE, always a good portrait painter, is particularly fortunate

in his *Mrs. Halley*, than whom he could not readily have found a better subject for his skill. It is a work of great beauty and excellence. Among the younger men who have taken to portraiture, Mr. MACBETH-RAEBURN has produced a very fair picture in his portrait of a young girl, richly clad, and sitting on the floor of a finely carpeted room, surrounded with red roses and other accessories of colour, carefully chosen to heighten the desired effect. It is a promising piece of work. C. KAY ROBERTSON is successful also in the portrait of *Mrs. Maitland Mackgill Crichton*.

Sculpture in Scotland, as elsewhere, is now mainly a matter of portraiture; nor is it even a great matter as such. As a rule, the statues and busts which adorn public places are arranged for by committees, who, even when they have a fair choice of models, generally choose not the best. The sculptor who would succeed must address himself to the easily-recognised class from which such committees are formed. From the present exhibition it is apparent that the Paisley committee charged with getting a statue of the local poet TANNAHILL had the choice of at least two models—the one of heroic size, but with no artistic claims; the other a small model, but full of refined and careful work, by a Mr. McBRIDE. They, of course, chose the former, and the town of Paisley, like many another town, will have its statue to be jeered at. We do not say that the unsuccessful model by Mr. McBRIDE is everything that could be desired, but it is at least a conscientious work of art. He is one of those who struggle towards an ideal aim in sculpture, and, if he is not always successful, the fault seems to lie in his too great devotion to refinement. He would do well to throw this aside for a little, and try wider and broader conceptions—in short, to follow the example of G. A. LAWSON, whose *Girl with Tortoise* is placed beside and forms a marked contrast to McBRIDE's *Girl listening to the Murmur of a Shell*.

#### MINOR EXHIBITIONS.

THE Water-Colour Exhibition opened at the Dudley Gallery this week by the Art Society now in possession is a decided improvement on that of last year. Many members of the Council have done well for its success. Mr. GEORGE FRIPP lends one or two of his inimitable little English landscapes, hayfields, and the like; Mr. HERBERT MARSHALL contributes a spirited study among the shipping on the Thames, *Foreshore at Blackfriars*, with St. Paul's dome soaring silvery in the distance, an admirable drawing, full of masterly outline and harmonious relations of colour; Mr. WALTER SEVERN is more interesting than usual in his ambitious Alpine views; Mr. BRETT, A.R.A., sends a gem-like study of serpentine rock and green sea at Kynance. Distinguished among subscribing members is Mr. WALTER LANGLEY, of whose three contributions a group entitled *The Old Story*, a weather-beaten tar reading the newspaper to his daughter, whose thoughts are far away from him and from her net-mending, gives scope to the artist for his strong study of character and clever technique, also for unaccustomed beauty in the girl's expressive and rich-tinted face. The background of rough wall and timbers is careless, and mars the completion of the picture by awkward obtuseness. Certain little pastorals thrown off with playful blottesque touch in the Impressionist manner by G. CAFFIERI are full of suggestive charm. Mr. EDWIN ELLIS has been allotted the head of the room for his large landscape *In the Fold*, which has the depth and splendour of oil and an attractive largeness of manner, qualities that may counterbalance the artificial compromise between natural and conventional Poussin-like colour.

The galleries in Conduit Street are filled with pictures in oil, water-colour, and black and white, with some sculpture—the second exhibition of the so-called Nineteenth Century Art Society. There is nothing remarkable about this enterprise, save the admixture of palpably juvenile efforts with more mature performance. Several names which we had marked for promise in landscape art at the Dudley Gallery reappear in the catalogue of this exhibition, among them GEORGE MARKS, W. H. WHEELER, A. KINSLEY, AYERST INGRAM. One of the best studies by "rising artists" is an interior after the vein of old BILLY HUNT, a loft with a rustic lad chewing a hunch of bread, *At Dinner-time*, by Mr. H. S. TUKE. Many small panels and groups by Mr. GEORGE TINWORTH are among the sculpture exhibits.

Mr. POWNOLL WILLIAMS attracts lovers of the Mediterranean coast by his third series of drawings shown at Messrs. McLEAN'S rooms. The artist's brush is ready to a fault, there is just a touch of impudence in his offhand manner. But it were ungrateful to quarrel with style that can convey an impression of place and time so characteristic and poetic as we find in many of these sketches and studies about Alassio and Mentone, on Como Lake and in Venice. Mr. WILLIAMS'S colour is singularly sonorous and delightful, whether in splendid flush or evanescent grays, and his drawings even seem to quiver with light. Although he uses body colour for effects not to be got without it, much of the vivid depth of his tone is attained by skilful washes. As an example of brilliance may be named the study of *Sunset*, numbered 53 among the Venetian studies. For delicacy the work about Alassio is the best, notably *Old Fort at Laigueglia* and *Ruined Church of Sta. Croce and Roman Way—Evening*.

It is difficult to bring grave criticism to bear on an exhibition of architectural subjects such as that opened at Messrs. DOWDESWELL'S, in Bond Street, of work by Mr. WYKE BAYLISS. Here are oil pictures and water-colour studies, many on large scale, of some of the most famous and beautiful church interiors in the world; laborious, not wholly unimpressive, but yet, if taken from the point of view of the professional architect or of the amateur of architectural beauty, unsatisfactory and incomplete. Mr. BAYLISS is not correct enough to satisfy the one or poetic enough to please the other. The limner is a writer on art and a thoughtful one, and perhaps he has too many "notions" as JONATHAN says, for a reliable painter. Frankly, though admiring the ambition with which he has essayed to reproduce the glorious choirs and aisles of Chartres, of Coutances, of St. Rémy, of picturesque Caudebec, and elegant Eyreux, our admiration stops short. There is monotony in the artist's variety; we weary of his palette and find artifice in his arrangement; his masonry lacks solidity, and we crave for precision in his detail. Nevertheless there is indeed here honest attempt to reproduce faithfully an impression of the grandeur and richness of many a revered pile; and to judge by the criticisms we heard on the day of the private view, and by the fact that a large number of the pictures are on loan from their owners, Mr. WYKE BAYLISS is not without appreciative response to his unmistakably earnest efforts.

### THE COMMON SENSE OF LONDON HOUSES.

MR. EDIS, in his first Cantor lecture, to which we have already referred, dwelt strongly upon the term "common sense," as suggestive of a condition of things in respect of the design of London houses which, if only negatively, is at present much to be desired. For instance, the access of sunshine ought to be systematically provided for, instead of being left to accident to be thrown into utter confusion. Brickwork ought to be frankly accepted as the natural material of the town, and a better material than stone for all domestic and non-monumental purposes. Terra-cotta ought to be cultivated as a legitimate refinement upon brick, easily dealt with, inexpensive, and highly effective artistically. Glazed brickwork ought to be also made use of, if only as a self-cleansing surface in an atmosphere overloaded with defilement. "Italian palaces and Gothic fortresses" ought to be equally refused admission into modern London streets; both being equally inappropriate, inconvenient, and ungraceful in the circumstances of London life. Our own Elizabethan or Stuart modes ought to be rather studied, as likely to turn out better for our own modern requirements than any styles of antique times, belonging to other lands, other climates, and other peoples. Our houses ought to tell the story on their faces plainly of English convenience and English comfort within; such comfort and convenience being the sole primary considerations, and the outside grace the mere pleasant superficiality which in these days any sufficiently well-bred architect is able to devise, without difficulty and without fuss. Parisian façades, again, in "linked sweetness long drawn out," however gracious in their proper place, are scarcely suitable for London streets and London clouds. The picturesque ought rather to be aimed at, as a rule, for English town effects—the picturesque allied to common sense, regulated and restrained by it, and enhanced by it. Our ironwork, as typified in the cast railings of areas and balconies

and the melancholy patterns of lamp-posts, ought to be converted—the administration of a very moderate dose of common sense would do it—into equally easily obtainable and infinitely more enjoyable efforts, however humble, in inexpensive hampered work. It is in such small matters, says Mr. EDIS very sensibly, that the taste of a *people* is shown. Good design, he says again, costs nothing; and indeed it certainly need cost no more than a little exercise of brain power, itself the most pleasant, by the way, of all exercise, and the most surely its own abiding reward. There may be nothing very new in all this, but it is very true, and cannot be too often repeated.

Mr. EDIS lays a great deal of that quality in London housebuilding affairs which is not in harmony with common sense at the door of "Bumbledom." As a rule, all vestries, local boards, and other municipal authorities, together with the private agencies of ground landlords, he would sweep away into limbo. They do not, he thinks, answer; or, rather, they answer a great deal too well in the wrong way. Without them London might be delightful; with them it is, as far as they can make it so, delightless. By the way, might it not be well to give a hint about this to Sir WILLIAM HARCOURT and Sir CHARLES DILKE just now? We cannot conscientiously recommend Mr. President HORACE JONES to tackle the Government any more upon such points; but is there no one at all who could try a hand in the interest of grace when new municipal reforms are so much in the air?

### THE INCIDENCE OF BUILDING RISKS.

(Continued from page 105.)

ALL risks incidental to building works appertain to the building owner, and he must retain them until he can find someone who is willing, "for a consideration," to take some of these risks. This someone is usually a builder, whose business it is to build, taking more or less risks in building. He should be an expert in building risks, and know how to calculate their value, which the building owner rarely does. Where is the hardship to the builder in making a contract with a building owner to do a defined work for a defined payment, taking some of the risks attaching to the building owner for just so much as he (the builder) considers them to be worth? Builders do not want dry-nursing or petting; they do not want to be told that they cannot make bread by building contracts because of their risks and contingencies, but may make their fortunes if they will turn to engineering contracts, which of course have no risks or contingencies attaching to them. Out of the frying-pan into the fire with a vengeance. If good people who talk so kindly about engineering contracts would but read the general conditions attached to any contract for making a railway, they would surely throw up their hands in wild amazement, exclaiming, "Can such things be?" Builders know very well that to eliminate risk is to eliminate profit. Every trade has its risks, some more, some less, and why should the building trade be exempt? Read the general conditions for building contracts issued by the Central Association of Master Builders of London (on the lines of which most of the contracts for important buildings are now based), and say where is the injustice to the builder to be found in them. There appears to be plenty of "bowels of compassion" for builders who are usually calculating, shrewd, hard-headed men of business, but very few for the building owner, who is the veritable "milch cow" of the business. Of the "Five Alls" of the old-fashioned tavern sign, his "all" would be "I pay for all." His risks are many, and cannot be transferred as to the most onerous of them. A great risk is the probability of the building turning out unsatisfactory or unremunerative. He thought he knew what he wanted; but, when the building is finished, he finds it is something quite different. He thought he should realise a fair percentage on the investment, and he finds the supply exceeds the demand, and the property either remains unlet, or has to be let on unremunerative terms. He employs an architect—another risk. The architect may fail to understand his instructions, and the employer may fail to find this out until too late. The architect may mislead his client as to cost. Of all the sins which architects commit professionally, this is probably the one most often committed. From ignorance, or from vanity, from refusing to cut the coat according to the cloth, architects are constantly understating the probable cost of works to their

clients. And then comes the miserable process of cutting down the estimates, a process in which the building is usually spoiled, and the employer may think himself fortunate if for every pound reduced he has not sacrificed at least twenty-five shillings' worth of efficient work. There is the risk of the dreaded "extras." In a well-considered contract these ought scarcely to be found, but a prudent architect will always have a small percentage reserved to cover the incidentals which always crop up towards the finish of a building. If the employer will interfere with the works by variations after the contract has been made, he must take the responsibility of so doing. This removes the risk. It is a deliberate undoing of the safeguards which had been prepared for him. The beginning of variations is the beginning of peril. If, unknown to his client, an architect introduces variations into a building, the employer must pay, for the architect is his agent; but surely all the cost of "such" variations and of all the expenses consequent thereon ought ultimately to fall on the architect if the employer suffers injury thereby. As between builder and employer, the employer must pay, but as between architect and employer what should happen? An architect ought not to spend or risk his employer's money without the direct sanction of his employer. If he does, such doing should be considered *ultra vires*, and the architect should be liable to the employer for the whole loss sustained. It is out of these mischievous variations that most disputes arise. In carrying out a contract for defined work for a defined sum without variations, serious difficulties can rarely arise, but introduce variations, and it is as "the beginning of strife." And litigation once begun introduces other and unknown risks to the employer. He had left all the details of the specification to his architect; he did not pretend to understand the technical terms; but as a man of business he read and thought he understood the "general conditions" of the contract; he thought they were fair and that they would be binding on both parties. He sometimes trusted to a broken reed. Disputes came, and "all matters in difference" were referred to an arbitrator. If to a barrister, he was pretty sure of having the general principles of the contract maintained, while the technical terms of the building trade were hopelessly floundered in by the legal gentlemen on the one side or the other. If to an architect or surveyor, or to an architect and surveyor, other risks may arise. An attempt would probably be made to upset the contract, general conditions and all, and the "architect, &c." arbitrator, if sufficiently "battered," sometimes falls into the trap. He considers he could have drawn up far better general conditions than those of the contract; indeed, he does not think the builder should be bound by such general conditions, and all matters in difference being referred to him, he simply ignores conditions and contract, and proceeds to deal with the builder's claims (always models of rectitude and setting forth both sides of the account with strict impartiality) on the basis of fairness "as it appears to him." From such arbitrators may building owners in future be delivered. Risk to a building owner from "the surveyor" employed is comparatively slight. There is "incompetence" to be guarded against; but given an intelligent practical surveyor, and he will usually be found a great safeguard to employer, architect, and builder. He should be this, and can be; but he must be a "free" agent, and willing to use his freedom. Risk from the builder—this ought scarcely to be. There are so many good builders, why risk the employment of an uncertain one? The building owner does not know the building world; the architect should. If he does not, the surveyor should be able to help him. Good builders want fair prices. If employer or architect seek to get the work done for less than its fair market value, he seeks that which is out of the pale of true business, and loses touch with good builders. If in an unhappy moment the employer is beguiled, by the hopes of saving a small percentage, into the employment of an insolvent builder, woe betide him. The "daughter of the horse-leech" was a poor thing in her demands compared with this interesting creature. An unceasing demand for certificates; when refused, unsparing abuse of the architect. The money obtained from this work, often before it is due, carried away to keep speculative work going; the work starved for want of men and materials, bankruptcy at an opportune moment, the work dragging its slow length along, partly finished by trustees, litigation, "heads I win tails you lose" catastrophe. This is no fancy picture. Those who have spent a long professional life among contentious work can tell of many such. How impor-

tant then it is that an architect should protect his employer by pointing out to him the absolute necessity of employing "good men and true" only. An architect should also caution his client against accepting a tender manifestly too low. Doubtless it is tempting to an employer to get his work done for less than cost to the builder, but it is not business, and does not pay in the long run. Employers too often say, "I employ an architect; he will protect me, he will see that value is received before a certificate is given." It may come right in the end, sometimes it does not, and when it does not an honest man will not have much sympathy for the employer in his troubles.

In town work "injunctions" are often a terrible risk to the employer. When they come the builder usually suffers also from delay and incidental expenses, but the bulk of the loss of course falls on the employer. These injunctions appear to be things which "no fellow can make out." Each judge appears to do that which is right in the sight of his own eyes. Every tub here stands on its own bottom. You find a case very nearly on "all fours" with your own, and a very pronounced decision thereon; but now another judge decides quite otherwise, and the employer suffers accordingly. And the injury done to handsome new buildings in London alone for the protection of houses scarcely fit to be dog-kennels may safely be stated at hundreds of thousands of pounds sterling. And confusion in this "light and air" business having become worse confounded, no light appears at present to light up the chaos which prevails. It is pretty nearly all blind chance as to what will happen. Of course there are many more risks to the employer, but let these suffice.

In conclusion. "To employers." Count the cost. Remember the stigma which has attached from days of old to the man who began to build and was not able to finish. Employ competent architects, surveyors, and builders, and trust them. When you have settled on a design, "let it alone." Pay fair prices for good work.

"To architects." Hold the balance even between your client and the builder. Try to keep your client out of mischief. If you see him running against a post, point out the post to him.

"To surveyors." Do your work thoroughly and conscientiously. Duty first. Nothing extenuate, nor set down aught in malice.

"To builders." Do not rush after work at unremunerative prices. Do not take risks without equivalents. Refuse contracts where the clauses are unfair. Employ good workmen. Pay fair wages and use good materials. Avoid doubtful employers.

"To arbitrators." Decide the cases before you on their merits, not according to your prejudices. To slightly vary some recent words of Mr. Justice STEPHEN, "arbitrators are bound by just as solemn an obligation as that which bound judges of the land to be guided in their conduct by the law as they understand it; and if they misunderstand it, or wilfully disregard it, they resemble unjust judges."

"To all." If it be possible, live peaceably with all men.

JOSIAH HUNT.

## PARIS NOTES.

DURING the past week the great topic of discussion and gossip in the artistic world of Paris has been the difference—to employ the somewhat euphemistic French term—that has arisen between Mrs. Mackay, the wife of the well-known American millionaire, and M. Meissonier. Amid the flood of talk and angry recrimination from the partisans of both sides, it is impossible to arrive at the merits of the case; we therefore confine ourselves to a relation of the facts as given in the Paris papers. It appears that Mrs. Mackay had commissioned Meissonier to execute her portrait, which was exhibited at the last Salon. Thereupon the lady complained that the painting did not appear in a sufficiently advanced state for exhibition, and that, moreover, it was rather a caricature than a likeness. Great was the anger of the artist, who immediately summoned Mrs. Mackay to accept delivery of the work as it was, and to pay him the sum of 70,000 frs. Mrs. Mackay received the canvas, paid for it the sum demanded, and forthwith put it on the fire.

An exhibition of Meissonier's works is announced for the spring at the Georges Petit Gallery in the Rue de Sèze. The net receipts will be handed over to the Committee of the Night Refuge Fund (*Ceuvre de l'Hospitalité de Nuit*).

The works of C. A. Sellier, lately exhibited at the Ecole des Beaux-Arts, were disposed of last Monday at the Hôtel Drouot. The best prices realised were:—7,200 frs. for a *A Blacksmith's Forge at Audelys*; 4,000 frs., *An Alchemist's Laboratory*; 1,650 frs., *Leda*, exhibited at the 1880 Salon; and 1,450 frs., *A Butcher's Shop near the Tiber*.

M. Gautherin has received a commission from the Department of Fine Arts for a marble bust of the late M. Achille Martinet, the engraver and member of the Académie des Beaux Arts.

The hearing of the great Trouillebert-Fedesco suit began in the First Chamber of the Paris Civil Tribunal on Saturday last. The defendants, MM. Fedesco frères, are picture dealers, from whom damages are sought on the ground that a painting entitled *La Fontaine des Gabourets*, which had been sold to M. Alexandre Dumas fils for 12,000 frs. as a work of Corot, was in reality by M. Trouillebert, who offered to prove that it formerly bore his signature, and that his name had been obliterated and replaced by that of the great landscape painter. The plaintiff furthermore stated that a colour dealer had in the first place bought it of him for the insignificant sum of 150 frs. On behalf of M. Fedesco, M. Cléry contended that it was more than doubtful whether M. Trouillebert was the author of the picture, even supposing that it was not the work of Corot; the plaintiff, in fact, had never previously revealed himself as a landscapist, although he had contributed annually to the Salon. He doubtless brought this action with a view of creating a little stir round his name, and bringing it prominently before the public. Legally he had no claim, for there had been no relations between the parties. Such was the gist of the defence, and, at the conclusion of M. Cléry's speech, the case was adjourned for a week.

By decree of the Minister of Public Instruction and Fine Arts, M. Edmond Guillaume, architect of the Louvre, has been appointed to succeed the late M. Lesueur as Professor of the Theory of Architecture at the National School of Fine Arts. For the seat left vacant in the Académie des Beaux-Arts by the decease of M. Lesueur there are no less than six candidates—MM. André, Diet, Doumet, Magne, Normand, and Renard—all of whom have some claims to election, although the first-named has probably the best chances of success. The architectural section of the Academy will make its recommendation on Saturday (to-day), and the ballot is fixed for March 1. For the late Professor Dumont's seat in the sculpture section, there are already three competitors in the field.

The distress undoubtedly prevailing among the labouring classes of Paris, particularly in the building trade, has rendered it probable that several projected public works which, though adopted in principle, had been indefinitely adjourned for execution, will be taken in hand without much delay. By request of the Prefect of the Seine the city architects are drawing up a list of those municipal works which, having been approved by the Council, may be proceeded with at once. At the same time, an active exchange of correspondence is going on between the City and the State relative to the great undertakings, such as the reconstruction of the Sorbonne and the opening-up of the Palais Royal, the expense of which is to be borne jointly. A demand for credits for the immediate commencement of certain works in the first-named category is expected to be laid before the Municipal Council during the course of next week.

The Paris Markets' Committee have decided to build a new market on the Boulevard Richard-Lenoir, between the Rue Boule and the Rue Sedaine, to be devoted especially to wholesale trade in eggs, butter, and cheese, and to the sale of horses.

Denon's grand staircase in the Louvre, which has remained in an incomplete state since 1866, is now progressing towards completion. The vaulted portion of the roof will be inlaid with mosaics, but this part of the work will require several months longer.

The heavy part of the alterations that are being carried out in the vast Salle des Etats is now finished. Readers of *The Architect*, in which an account of the work to be done appeared some months back, may remember that the principal change consisted in removing the massive roof and replacing it by a glazed one. This has been done successfully, and, in point of light, the large hall is now fitted to receive pictures, which are to be chosen by a committee of artists.

The singular pretensions now being put forward by Paris workmen may be judged from the depositions of carpenters and sawyers made before the Parliamentary Committee of forty-four elected to examine the industrial crisis. The representatives of the former complained that the Treaty of Frankfort permitted the importation of made-up joinery at a lower rate of duty than the rough wood. Such a statement is so impossible as to be scarcely worth refuting. The same delegates next complained of the use of machinery in their trade. They dare not propose the destruction of machines, but demanded the imposition of a heavy tax upon them, levied in proportion to the work turned out. Another grievance was that the masters did not pay the rate of wages fixed by the City of Paris scale, which allows 1 fr. 15 c. per hour for carpenters' work. In relation to this it must be remarked that the rates were never intended to be applied, being only an artificial standard for estimating the maximum cost of work in the plans drawn up by the municipal architects and engineers. Thus, when public tenders are invited, they are almost invariably found to be much below the official limit price. The men, however, refuse to see the matter in this light, and seem to imagine that they have a standing right to this maximum rate of wages. They stated, moreover, that the masters took advantage of the existing stagnation to pay only 80 c. an hour, though 80 c. or 8 frs. for a day of ten hours does not appear starvation wages. The Union to which these men belonged comprised 200 shops and 5,000 members, of whom, they averred, 3,500 were out of work: but this latter statement is said to be considerably exaggerated. So far, however, it may be said that the principal grievance of the trade societies admitted to give evidence appears to be that they have had to work under the maximum rates of wages used in estimating the cost of public works.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE eighth ordinary meeting of the Institute was held on Monday evening, Mr. D. Brandon, vice-president, in the chair. Attention was called to the drawings of the Soane medallist for 1883, Mr. R. A. Briggs, which were hung on the walls, and it was stated that a second moiety of 25% had been awarded to Mr. Briggs.

A paper was then read by Mr. Killingworth Hedges, A.M. Inst. C.E., of which the following is an abstract.

##### Precautions to be Adopted on Introducing the Electric Light into Houses.

Mr. HEDGES began with a reference to two papers on the electric light read before the Institute by Mr. Slater in 1881 and 1882 respectively, and spoke of the great progress made since in the commercial application of the invention. To facilitate the lighting of streets and private houses the Electric Lighting Act of 1882 was passed, under which twenty-three applications for provisional orders were made in that year by local authorities and 106 by companies formed for the extension of the system, which, however, the stringency of the regulations laid down by the Board of Trade had temporarily checked. Meanwhile a largely-growing number of occupants of houses had set up the necessary plant for producing the light themselves. A description was then given of the plan for supplying electricity to private dwellings by means of batteries. The most effective system of the kind seemed to be that invented by Mr. Ross. The various modes of generating electricity were next rapidly reviewed. In town houses a gas motor was, as a rule, the best; in country houses all three sources of power—water, steam, gas—had been employed. Common coal gas could be dispensed with by using Dowson's gas, of which a description was given, and whose great advantages were set forth at length. The cost had been proved to be 50 per cent. less than that of the ordinary article at 3s. per 1,000 feet. The engine-house would contain the dynamos, which should be fixed on wood, to insulate them electrically from the ground. From the dynamos the current should be taken to a switch-board. If accumulators were used the current from these would join on to the same board. From this switch-board the mains went to the lamps, starting as a large cable, which branched away like the gas-pipes until each incandescent lamp was reached. It was of

the last importance in electric lighting that the current should always be uniform at all times in each individual part of the work, and independent of changes in other parts. The compound shunt-machine for effecting this was then described, and it was shown that by means of it the regulation of the electric supply is more perfect than that of gas. The honours of this invention were claimed by several of our British electricians. A highly effective form of the machine was that designed by Messrs. Crompton & Kapp, who had greatly improved on the Bürgin dynamos, while Dr. Hopkinson had not only materially reduced the cost of Edison's, but had increased the commercial efficiency some 3 per cent. The actual efficiency of the improved Edison-Hopkinson dynamos was now 94 per cent., and its commercial efficiency 88 per cent. To enter, however, into a comparative description of the different systems possessing these advantages, and to discuss their relative merits, was beyond the author's scope, and he therefore proposed to describe some of the principal features of a supply of electricity and to point out the precautions necessary to its safe introduction and the guarding against fire risks. In the first place, to understand what this electricity is, the author said, we must disabuse our minds of the notion of that "invisible subtle fluid" of which men still talked so nervously, but which we daily use with impunity for ringing bells and working telephones. The electricity used for lighting was doubtless far more dangerous if uncontrolled, but if properly installed it was made as harmless as the galvanic battery employed by the popular lecturer in his experiments. The light was nothing but electric energy in the form of white heat, and the only peril was that this heat might be developed where it was not wanted, and might so cause fire. The possible danger from this cause had already attracted much attention both in this country and abroad. A special fire risk committee appointed by the Society of Telegraph Engineers and of Electricians was formed in 1882, and a set of excellent rules were drawn up by it, which were adopted *mutatis mutandis* by some of the insurance companies, and also by the Board of Trade in its "model order." Neither these rules, however, nor the "Standard of Requirements" laid down by the New York Board of Underwriters could be said to embrace all the changing details of an electric light installation. Such details could only be arrived at after the electricity has been worked a sufficient length of time, and has been generally distributed like gas. With a view of eliciting further discussion on the subject, the author proposed to offer a few general remarks as a small addition to what had already been put forth by the fire risk committee. The first source of danger to property, he said, is in the mains and branch wires which conduct the electricity from the engine-house to the incandescent lamps, which were distributed over a house in much the same way as gas. If these conducting wires were of sufficient calibre, and made of a material uniform in its resistance, the current would not develop in its passage any dangerous heat. In arguing the question as to the proper sectional area of the conductor, the author remarked that the electro-motive force had been compared to the difference of head of water necessary to cause a quantity of fluid to overcome the resistance of a pipe, whereas it was more like water soaking through sand, in that the whole of the cross-section of the wire interposes a resistance which in large conductors doubtless varies proportionally to the temperature of each section according to its distance from the outside radiating surface. As for the material of the wires, it was commercial copper, which was never absolutely pure, but could be got as high as 96 to 98. Now, since the wire's resistance depended on its purity, a short length of inferior wire might upset calculations based on the hypothesis that none but the purest wire is used. Thus not only might that inferior section become dangerously heated, but there would also be a waste of power. Copper was always used for electric lighting purposes, both because it can be got purer than any other available metal and because, next to silver, it is the best conductor of electricity. Having examined the proportion of the electric conductors to their work, the author went on to discuss the question as to the effect of a stream of electricity continually passing along them. He had found that if heating goes on largely, a change in the conductivity of impure metals may take place, but pure copper is apparently unchanged. A summary view of the evidence on which the conclusion rests was given. Passing thence to the subject of electrical connectors and joints, the author said special attention should be given to these, including not only all the joints where the branch wires lead off, but also the connections made with binding screws. Besides causing resistance in the circuit, bad contact between a wire and a terminal would engender heat; hence the area of the contact piece should be large enough. It was further shown how provision should be made in the case of a sliding connection for taking up the wear and firmly pressing the surfaces together. The joints used were most important factors in an electric light installation. For these joints solder alone should never be relied on. A joint must be made mechanically perfect, and considerable pressure used to unite the surfaces; the solder might be then applied to keep the whole air-tight. The next section of the paper showed how the danger arising from short circuits was to be met with. The term, it was remarked, meant that the current, instead of going a circuitous route, takes the shortest path,

where, having no work to do, it causes fire. The three ways in which short cuts might be set up were pointed out, as well as the measures to be adopted in such emergencies. The only preventive was a cut-out or safety fuse. The author referred to experiments of his own in order to ascertain the most suitable and reliable material. After trying numerous foils he obtained a special alloy of aluminium, whose resistance as compared with that of silver was about 45 per cent. Testing an installation was the next subject for consideration. To insure this being properly carried out, a current capable of overcoming a high resistance should be sent through the whole of the wires; that from an ordinary battery was of little use. A portable hand apparatus was used for this purpose in America, which, on turning a handle, sends a current through every one of the wires and shows any leakage by ringing a bell. The foregoing remarks, said the author, had been made with reference to incandescent lighting, but applied to arc lights also, which latter brought with them other fire risks of their own. The chief of these was the danger arising from pieces of incandescent carbon dropping, and more fires had occurred from this cause than from any other. Before quitting this subject he gave some interesting information as to how some of the fires caused by the electric light in America had happened. In one district, in which there were sixty-one mills, fifteen fires were due to some form of "short circuit," generally owing to the leakage of water or the washing of floors. All of them would have been prevented by proper insulation and reliable fusible safety plugs. Three fires were caused by cross arcs of one wire to another where uninsulated wires were fastened against conductors. In one instance the conductor was formed by dust settling upon uninsulated wires, and on a damp day it absorbed enough moisture to make a path for the formation of a cross arc which started a fire. In a second case the wires were fastened to a damp beam which was decayed and burnt nearly in two by a smouldering fire. In a third instance damp brickwork in a tunnel became a sufficient conductor to set up an arc which did no material damage, but injured the dynamo. These fires were not necessarily destructive, as they generally occurred during working hours, and so were soon discovered and dealt with. Electricity, though having no smell, like gas, to betray a leak, showed when it was escaping by the diminished brilliancy of the lights. In London Captain Shaw reported no fire as due to the electric light for 1882, and but one in 1883; this was due to the overheating of the wires. In this country the installations had, as a rule, been in the hands of skilled persons. It was most necessary that in the eagerness and hurry to push forward the new light, the work of wiring houses and fixing the lamps should not be left to bell-hangers and others destitute of the requisite knowledge of electricity. The best guarantee of safety in the use of the electric light was the employment of experienced men in the work of installation. In such hands it was far less dangerous than gas, which not only poisons the air we breathe, but ever lurks as a slumbering volcano ready at any moment to put forth a terrific power. When properly installed and managed electricity was by far the safest illuminant known. It was to be hoped the insurance offices would soon recognise the fact by reducing the premium on all buildings from which gas is excluded. The alleged comparative immunity of the electric light from accident was accordingly treated more in detail in a special section, which was followed by the author's closing remarks on the important subjects of wear and tear and working cost, all of them involving a good many technicalities in their discussion.

Mr. SLATER moved a hearty vote of thanks to Mr. Hedges for his paper. That gentleman, he said, had alluded to the disappointment that had been felt at the comparatively small success of electric lighting as compared with what was expected of it. Three years ago, when he (the speaker) had brought this subject before them, expectation was at the highest pitch. The actual achievements effected in France, and the success of the Edison experiments, had all combined to excite in the public mind the most extravagant expectations. Stock Exchange speculations and immature instalments put up by incompetent persons caused the failure, and the speculations led to a number of inventions which hurt the British public in a tender spot, namely, the pocket. Then followed a shriek that electric light was a failure, that the companies must be wound up, and the money returned to the British pocket. The scenes, for instance, that took place at the winding-up of the Brush Company were utterly discreditably to the public. If ever there was an invention where the motto *festina lente* ought to have been adopted it was in regard of electric light. Mr. Slater having adverted to the use of the light by the large hotel proprietors, steamship companies, private owners, &c., asked whether the light could be pronounced a failure? Of course there were difficulties to be overcome; but the centre of the difficulties had now shifted, and, as Mr. Hedges pointed out, laid principally with the mains and general distribution. Mr. Hedges, he thought, had rather shirked two difficulties as to existing houses, namely, the wiring and the lamp-fittings. If one began to cut chases, damage was done; the cutting-away and making good entailed an enormous cost. It was impossible to estimate what the ultimate cost would be beforehand, so that in the end they would cause great disappointment to their clients. The plan was not to cover

the wires at all. The wires might be carried along under a dado where they would be scarcely visible at all. Utilising existing gas-fittings for purposes of economy he considered was most unwise.

A VISITOR spoke in praise of Mr. Hedges's foils. He said he had tried them and they acted with a regularity that had astonished him. There was, besides, a great peculiarity about them that prevented their indiscriminate use by people who did not understand their properties.

Mr. GRUNING said he was particularly interested in the question of cost, and wished he had another year's experience in that direction. He did not pretend to understand all the other details of the subject.

Mr. JOHN HEBB said that the Metropolitan Board of Works had under consideration the revision of the regulations which they had made some time back.

Mr. CROMPTON said that to speculation might be traced all the ills that electricians laboured under. But they knew that the invention had progressed steadily and quite as quickly as was possible or desirable, and quite as rapidly as the most hopeful among them could have expected. Dynamos and lamps had improved, cost of apparatus had decreased, and what had been the greatest reproach, the uncertainty of the light and its likelihood to go out, had been removed.

Mr. HEDGES then replied on the various points that had been raised, and in the course of his remarks alluded to the success of the light at the Savoy Theatre, and said that Captain Shaw's reports showed that more than half the fires in London were due to the use of gas or petroleum oil.

The proceedings terminated with a vote of thanks to Mr. Hedges.

#### MR. W. B. RICHMOND ON MODERN ART.

AN address was delivered on Wednesday to the students of the Birmingham Society of Arts and School of Art, by Mr. W. B. Richmond, the president for the year. Mr. Richmond said that the subject he proposed to examine was the position of modern art, its relation to ancient art, the relation of religion to it, and the social conditions under which it had flourished. It was not with the views of pessimists that they should approach the subject, nor with one of too great regret that one age had not the same instincts of refinement, of poetry, or of taste as other ages had been the happy possessors of, for such a spirit would land them nowhere, and would not help them to see what real good might be got out of a state of civilisation wholly different to, but alike interesting, or the progress of the history of men's minds, and their achievements in present conditions of life. But while they admitted this they must also grant that modern art, while it had gained much had also lost something that was the natural heritage of it long ago; and the causes of such differences were matters of regret. There could be no doubt that the general drift of art, that was pictorial art, not only in this, but in all European countries, was towards the strongest naturalism, and that materialism had conquered for the moment all idealism. Further, that very similitude as opposed to symbolism was the verdict of good or not good art of the *vox populi* in the present generation. Such thoughts as by their delicate abstract quality seemed to demand a treatment of what was generally understood as conventional, or, as some would say, pedantry, or, as he should say, "style," when presented without the glowing colour of nature, nor with excessive resemblance to her more attractive, and consequently more superficial, beauties, were disregarded or eyed with contempt or even scorn—with hurried glances of resentment by an ever increasingly restless generation. The study of form for its own sake, whether in sculpture or architecture or painting, was much neglected, because the eyes of the public were not yet sufficiently delicately trained to care for or appreciate beauties of a calm, restrained character, but were content only to be immediately satisfied for the moment and on the instant, resenting all trouble patiently to study beauties of the higher kind, which were only discernible to the cultivated eye and the cultivated mind. So it was that, however faulty in proportion or absent in design so many of our public buildings were, the excessive use of ornament, however commonplace or vulgar, attracted and satisfied a sense for false splendour and costly blundering magnificence. Any revival of architecture, or to speak more justly, any birth of an architecture in England adapted to the climate, to the absence of light, and to the means to which it was to be applied, must, to say the truth, be very far off. We were not Greeks, nor Romans, nor Mediaevals, nor Goths; our banks were not temples to Apollo; our churches were not fortresses; our houses need contain no eyelet-holes for bowmen; nor were our courts of law ecclesiastical buildings. So it was not by following any traditions of ancient art, excepting its spirit of adaptability and sound sense, that we could expect a result either convenient or artistic. After further elaborating this contention, Mr. Richmond went on to speak in some detail of the characteristics of the Greek and Early Italian art, showing how they sprung out of the social surroundings of the spiritual

convictions of the times to which they belonged, conditions vastly different from those now existing. They might, he said, divide the motives of ancient and modern art thus: to the former they put the gods, the saints, angels, all that belonged to an abstraction, and man at his best, with his frailties and his absolute identity and personality; while to the latter they put man as a fact with no belief in mysteries much, not even poetic, with few ideas beyond immediate well-being or well-doing, but full of generosity and a great love of the natural beauties of the sky, the earth, and all that belonged to both saving the spiritual or suggestive thoughts which belonged to other ages of not less materialism, but of more poetry. Coming to the point of what we had to look for in modern art possible and natural to the conditions of our time, Mr. Richmond said that one of the most healthy signs of the English nation was its genuine—indeed passionate—love of landscape. There was no people in Europe so alive to its beauties. Landscape painting might be said to be a modern art. Of all the arts the art of bringing the fleeting beauties of a sky together and of leaving for ever impressed upon canvas the moment any welcome of the early dawn, the wealth of sunlight in the midday, or the sad suggestions of sunset, twilight, and the solemn night—that art had perhaps the nearest claims to general sympathy. The art of Turner, of old Crome, of Constable, had still in front of her a vast horizon of greater truth even and of yet deeper meaning. This lovely art of arresting the fleeting effects of all varieties of scenery was one of our chief inheritances, and it might be said that, while the sky remained in its infinitude of forms and colours, and the earth teemed with her inexhaustible beauties from a blade of grass to the forest from hillside, one of the most precious forms of art could never die, but must progress with the keener perceptions of man for its natural beauties and his knowledge of the deep hidden science thereof. Of decorative art, that of the severest and least seductive kind, having for its chief charms the entire beauty of form, the purest sentiment for balance of lines and a method of colouring such design was reticence and dignity. Although so severe and restrained a manner of design few could ever hope to attain to, it was a quality the most to be fostered at this present moment. In conclusion, he praised with all heartiness the really healthy spirit in which our younger painters, to whom we had to look for our future in art, attacked their work. All great poets, statesmen, and painters had been the children of their generations, and had touched the dominant note most characteristic of the chord of the instrument on which they were playing. The spirit of English art must be English art to the core, or it was nothing. To be a vital part of the intellectual movements of so great a nation it must be animated by its own time, though guided by the spirit of ancient art, because its watchword was sincerity.

#### GOLDSMITHS' EXHIBITION IN PESTH.

THE Goldsmiths' Art Exhibition was opened on Monday. The exhibition comprises over 7,000 ancient Hungarian *objets d'art* in gold and silver, and of the greatest rarity, together with ornamental crowns, vessels, arms, and ecclesiastical utensils. The total value of exhibits is estimated at 15,000,000 florins.

The Vienna correspondent of the *Standard* says the principal objects have been lent by the Imperial "Schatzkammer" at Vienna, and by the various archdukes, magnates, and ecclesiastics, and a few have come from abroad. Amongst the crowns is one set with pearls, and with which King Ladislaus and the great Matthias Corvinus were crowned, and the so-called "funeral crowns" of King Bela III. and his wife Anica of Antioch, found in their graves at Pressburg. There are also several pieces of enamel from the crown of the Emperor Constantine Monomacchus bearing portraits of the emperor, his wife, his sister, and two dancing girls; and a crown discovered in the last century during the excavations made at Grosswardein for fortification purposes, and whose origin is uncertain. Another remarkable exhibit is the so-called exchequer of the Gothic king, Atanarich, consisting of a number of golden cups and vases weighing 2,400 ducats, discovered at Torontal. Amongst the ecclesiastical articles are the pyx and chalice presented by the Hungarian king Louis of Anjou to the chapter of Aix-la-Chapelle in 1340, and now lent by it; further, a huge golden bust of King Ladislaus crowned, from the high altar of the cathedral in Raab, besides about thirty golden chalices from the time of Matthias Corvinus when the goldsmiths' art in Hungary was at its height. There is further a golden cup, richly set with jewels, which possesses a remarkable history. It was given in 1598 to Count Nicolaus Palfy by the Austrian States for services rendered in the reconquest of Raab from the Turks. This cup, which weighs 1,000 ducats, and is still more valuable for its rare artistic merit, was afterwards given by a son of this Nicolaus Palfy as ransom to extricate his father from the hands of the Croats, who had made him prisoner. It thus came into possession of the Sultan, and was eventually presented to the Austrian Emperor Leopold, who, recognising the arms of the Palfys on it, restored it to the family.

## NOTES AND COMMENTS.

THE London Corporation will astonish a good many people by what they propose to show at the forthcoming Health Exhibition. While the majority of exhibitors will bring things which belong to the present age, the City authorities intend to do more, for they will represent, as far as space will admit, one of the streets of old London—probably Cheapside. In some international exhibitions typical houses have been constructed in connection with the works of various nations, but this will be the first time in which ancient work is to be reproduced on so large a scale. The representation of a City street will impress visitors with the historic importance of the Corporation, and it will be one of the most popular sights of the exhibition. But care must be taken to ensure that the street is not a theatrical scene, and that it is archæologically correct. The expense of a row of houses in timber and plaster would not much diminish the City coffers.

BARON HUDDLESTON has borne testimony to the commodiousness of the new Assize Courts at Shrewsbury, which have been completed lately from the designs of Mr. T. M. LOCKWOOD, of Chester. According to his lordship more convenient courts are not to be found in England. Baron HUDDLESTON always endeavours to win the esteem of juries, and when he was a Member of Parliament he used to ask a great many questions about the absence of fitting accommodation for jurymen in courts. His lordship is fond of telling the story of the architect who, in planning a court house, began by calculating what was the smallest space in which twelve grown men could be cooped. In Shrewsbury there are separate boxes for the jury and the jurymen in waiting, and they are not places of torture for those who have had the privilege to be summoned. At a time when so much is heard from the Bench about the shortcomings of architects (and the judges' remarks have done much to bring the profession into disesteem), it is some satisfaction to discover that there is at least one architect in England who is able to meet judicial criticism.

A HOUSE-TAX is levied in Greece which produces 56,000%, or one-tenth of the entire direct taxes. In addition, a licence-tax is paid by everybody exercising a profession or trade, and it is based on the rent paid by professional men for their dwelling-houses and by tradespeople for their shops. It amounts to 56,000%. The growing prosperity of Greece is suggested by the augmentation of the house-tax. In the year 1848 it amounted to a sum of 7,680%, whilst this year it is calculated to bring in a sum of 56,000%, without counting the tax levied on the houses of the newly-ceded provinces. Indeed, at the rate the present construction of dwelling-houses is being carried on in Athens (where a stranger on arrival might suppose some general conflagration had taken place and that a new city was being built), it may confidently be predicted that in the course of a very few years—for the builder is at work throughout the country, and not exclusively in Athens—the house-tax will bring in at least 100,000% a year to the Greek Treasury.

THE archiepiscopal city of Canterbury is not an inviting place for a painter to dwell who has to depend for existence on the sale of his pictures. A Mr. HAYMAN, who has the misfortune to dwell there, was sanguine enough to suppose that if he painted the enthronement of Archbishop BENSON he would be rewarded by his fellow citizens. A committee was accordingly formed to raise money by guinea subscriptions to purchase the picture, which contained portraits of the local, clerical, and corporate notabilities. But only thirty-nine subscribers could be found, and the total sum received was 40*l.* 19*s.* 6*d.*, one subscriber having munificently added an extra sixpence. Seven guineas had to be deducted for expenses, and Mr. HAYMAN receives 33*l.* 12*s.* 6*d.* for a work which is described by the Dean as being very accurate, and considered worthy a place in the Canterbury Guildhall. A school of art has been lately established in Canterbury by Mr. SIDNEY COOPER, R.A., but unless there is a change the students need not expect much patronage in their city.

A CASE lately tried in Glasgow recalls the fact that there was a maxim of Roman law which enjoined that whoever painted a picture became the owner of the work, although the

canvas on which it was painted was the property of somebody else. That maxim appears to be accepted in Scotland, but it is not certain whether it has equal authority in England, and, unless we are mistaken, HAYDON was often in difficulties in consequence of the doubt. In a corresponding case in Ireland, where lithographic stones had been lent by a printer, and he claimed possession of them, with the artist's work that had been drawn upon them, the Courts were divided in opinion as to the ownership. But the most equitable conclusion would be in those cases to adopt the Roman practice, although in the case of gems and works in precious metals the rule would not hold.

THE condition of many London houses may be inferred from the report of the London Sanitary Association. During last year 404 houses were examined by the officers. In nine the drains were entirely closed up, and there was no connection with the sewer. In seventy-nine houses, or about 20 per cent., the soil-pipes were found to be leaky, allowing sewer-gas, and in many cases liquid sewage, to escape into the houses. In ninety-three, or 23 per cent., the overflow-pipes from the cisterns were led direct into the drain and soil-pipes, allowing sewer-gas to pass up them and contaminate the water in the cisterns, and in many cases to pass freely into the houses. In 269, or about 67 per cent., of the houses inspected, the waste-pipes from the baths and sinks were found to be led direct into the drain or soil-pipes, thus allowing the possibility of sewer-gas passing up them, instead of these pipes being led outside the house, and made to discharge over trapped gullies in the open air as they should be. The figures do not seem to be quite correct, unless we assume that the same house may come in more than one class, but they show how much remains to be done to make ordinary houses perfect.

THE authorities of the City and Guilds of London Institute have been considering what further steps should be taken to develop the system of technical education which they have undertaken. It is proposed to extend the teaching in the various classes, and for this purpose four additional professors are to be at once appointed in the departments of Chemistry, Engineering, Mechanics, and Mathematics and Physics, together with teachers of languages, demonstrators, and lecturers on technology. At first it was supposed that the Institute would undertake only elementary teaching such as might serve for apprentices; but it has been determined that the instruction in the classes will be adequate to the requirements of persons who intend to become (1) technical teachers; (2) mechanical, civil, and electrical engineers, architects, builders, and decorative artists; (3) principals, superintendents, and managers of chemical and other manufacturing works. It is to be regretted that the authorities do not propose to establish at present a department of architecture and building. It is admitted that the addition would not need any great increase of the staff, and it may be added that London is more concerned in building than in some of the technological subjects. The building classes, if open in the evenings, would be sure of success.

BANKRUPT and compounding builders give a great deal of trouble to architects and building owners as well as to their creditors. At present it is difficult to say what their position is under the new regulations. It has just been laid down by Lord Justice BOWEN that the agreement consequent upon the familiar clause in a building contract which states that all materials brought upon the site by a builder during the progress of the work become the property of the building owner, need not be dealt with as if it were a bill of sale. That decision corresponds with what was generally held, but inasmuch as the Act of 1878 relating to bills of sale comprised "any other instrument by which a right in equity to any personal chattels shall be conferred," it was thought the obnoxious clause was insecure. But it still remains unnecessary to register a contract deed as a bill of sale. Another case was before the courts on Wednesday. A builder assigned by way of mortgage the sums he claimed under a contract, and the assignees sued for the amount. The building owner (Sir F. PEEK) applied to have the builder made a party to the action, either as plaintiff or defendant, in order to ensure that it might be ended once for all. But under the new rules the builder's consent is necessary to such a course, and, as that was not given, the application was refused.

A FIREPLACE IN METAL, TILES, & MARBLE FOR SIR J. WHITTAKER ELLIS.

DESIGNED BY MESS<sup>rs</sup> PRICE & ROBSON & EXECUTED BY WELLS & CO. LIMITED

DESIGN FOR CLUB-HOUSE, BEDFORD.  
BY ARTHUR WELLS, ARCHITECT.

## ILLUSTRATIONS.

CHURCH OF ST. MARY IMMACULATE, INCHICORE, CO. DUBLIN.

THIS building was commenced some years ago, but only the nave and aisles have been built. It is now proposed to complete the design, as shown on the view, by the erection of the central tower, transepts, Lady Chapel, &c.

The interior dimensions of the nave and aisles are at present 100 feet by 52 feet, and the height of nave from floor to ridge 66 feet. The entire church will have a length of 156 feet 6 inches, and the width across transepts will be 68 feet. The height of the western towers, which are at present only built to the belfry level, will be 106 feet, and the total height of the central tower and spire will be 192 feet.

The materials for the present portion are granite for the facings, Stourton stone for the dressings, and polished Peterhead granite for the shafts of nave, arcade, and principal doorway. It is proposed to substitute limestone and Portland for the Stourton stone in the dressings of the remainder of the work.

The cost so far has been about 9,000*l.*, and that of the whole church will be about 24,000*l.*

The contractors for the portion already executed were Messrs. MEADE & SON, of Dublin, and the architect is Mr. G. C. ASHLIN, A.R.H.A., also of Dublin.

THE LIVERPOOL ZOOLOGICAL GARDENS.

WE give this week another illustration from the architect's water-colour drawings of the large detached monkey house in the new Liverpool Zoological Gardens. The building will be half-timbered—like the restaurant and concert hall—decorated externally with cement modelling, worked by hand whilst the material is in a green state. The roofs are red tiled, except the metal coverings of dormers, ventilators, &c., which will be of copper sheeting, and the verdant weather stains from these will gradually extend to the tiling and preserve the homogeneity of the roofing.

The monkey house is furnished on its south side with open iron cages, providing out-door exercise for the animals in suitable weather. The old seventeenth-century house shown in the view is Dig Lake Farmhouse, which it is intended to repair and maintain as a small museum of local antiquities. The celebrated well which gave its name to this township of Walton-on-the-Hill (well-town) is situated upon the site, and will be religiously conserved.

The works are now in progress, under the direction of the architects, Messrs. WILLIAM SUGDEN & SON, Leek. Mr. JOHN SHAW, of Bowdon, Cheshire, is carrying out the landscape gardening works; and amongst other contractors are the Everton Quarry Company; Mr. W. RAMMAGE, of 42 Old Broad Street; Messrs. WARD, of Limerick Foundry, Tipton; Mr. ROBERT HIRD, of Shipley, &c.

Every lover of art and nature must rejoice in the rescue of thirty goodly acres of territory in a district where "the demon of competitive commerce" and his minion the jerry-builder have had it largely their own way. One need not be a Democratic Federal like Mr. WILLIAM MORRIS to echo the eloquent words of the late Mr. J. H. CHAMBERLAIN:—

We have awoke to the fact that it is wicked and base and vile needlessly to dishonour and desolate the country. We have found out that our rivers have nobler uses to which they can be put than being made receptacles for sewage. We have determined that, ere it is too late, some part of England shall be free from the kind of curse that has turned the once lovely country between Birmingham and Wolverhampton into a loathsome desert. If you disagree in this opinion then at least renounce all hope of art, and spare yourselves trouble that can only end in disappointment. But the truth is that this change for good is real; and lovely as England yet is, the number of those who can feel that loveliness, who can enjoy it, and are thankful for it, is continually increasing.

FINGARRY, STIRLINGSHIRE.

THIS residence, which we illustrate, has been recently erected for Mr. JOHN HUNT on a beautiful site at the foot of the Campsie Hills. The situation commands a wide view of the surrounding country to the south and west, and the principal rooms have been arranged to take the fullest advantage of the prospect. The house is built of a warm-tinted sandstone, and roofed with sea-green slates with red ridges; and the internal fittings have had very careful atten-

tion, mantelpieces, cabinets, bookcases, &c., having been specially designed by the architect with very successful results. Stained glass has been freely used throughout the house, the staircase window being composed of subjects from the "Idylls of the King," and the upper lights of drawing-room windows containing a series of cherub figures illustrating outdoor sports, which we hope to publish on an early date. The windows of the other public rooms are similarly enriched.

The work has been carried out from the designs and under the superintendence of Mr. J. B. WILSON, A.R.I.B.A., of 112 Bath Street, Glasgow.

DESIGN FOR BEDFORD TOWN AND COUNTY CLUB HOUSE.

THIS design was submitted in the late competition by Mr. ARTHUR WELLS, of 27 Chancery Lane, London, Hastings, and Bedford. Two schemes were proposed by the author—one having the principal entrance in the front and the other at the side of the building. The arrangement of the scheme illustrated will be apparent from the plan. It was proposed to construct the walls of the best local kiln bricks, the facings to be of Henlow red bricks, and the dressings, where moulded bricks could not be used, to be of red terra-cotta. The balcony would be of Portland cement concrete, with light iron joists to form the core, and paved with encaustic tiles.

FIREPLACE, PAINTED TILES, ETC.

THE illustration shows a selection from some work which was designed by Mr. C. H. PRICE and Mr. R. G. RITSON for the mansion in Mayfair of Sir J. WHITTAKER ELLIS, the late Lord Mayor. The work was executed by WELLS & Co. (Limited), who have attained a high position for their productions in metal and other materials.

## THE ARCHITECTURAL ASSOCIATION.

THE seventh ordinary meeting of the Association was held on Friday evening, the 15th inst., Mr. Cole A. Adams, president, in the chair. The following gentlemen were elected members:—Messrs. B. F. Fletcher, H. S. Wood, G. Jones, W. F. Gargery, W. B. Dawson, J. D. M. Crawley, J. M. Watson, and F. W. Pether. Mr. Lewis H. Isaacs then read a paper, from which the following is taken:—

## The Local Government of the Metropolis; its Relation to and Effect on Street Architecture.

Having traced the mode and manner of election, and having arrived at some idea of the class and character of the elected, let us see what results on the street architecture of the metropolis the present form of municipal government has achieved. I propose to take some recent street improvements where the design of the façades of the new buildings has been under the control of the authorities as illustrations—and I submit fair illustrations—of this branch of my subject. Let us see what the ancient and renowned City of London has done in this particular. Some fourteen years ago a great metropolitan improvement was effected in the doing away with Holborn Hill and the construction of the Holborn Viaduct in its stead. Those of my hearers who are old enough to remember the quondam state of things—the steep inclination of the old roadway, with a gradient of 1 in 17 opposite St. Andrew's Church and the consequent terrible wear and tear of horseflesh—will agree with me in thinking it is little short of a marvel how we could have submitted to such an obstruction to vehicular traffic in our very midst for so long a period of time. Many people are of opinion, and I am myself amongst the number, that the remedy applied—a viaduct—was not the right one, and the suggestion of the late city architect, Mr. Bunning, that the valley should have been filled in bodily was, after all, the correct solution of the problem. At the time it was made it was decried as being primitive and unscientific, but experience has clearly demonstrated that what was predicted as the result of a viaduct has come about, namely, the severance of Holborn from Farringdon Street, notwithstanding the costly provision of new side streets, designed with the object of obviating this difficulty. We have in the Holborn Viaduct a fine handsome thoroughfare, 80 feet wide, and with just sufficient curve in its direction as to realise the truth of the saying, "the line of beauty is a curve." The street at the time of its opening bid fair to be an architectural success. It started well in this particular. The four buildings containing the staircases leading from the upper to the lower levels have certainly some claim to our praise, and if the bridge and the statues thereon are not all that could be desired, they can at least lay claim to originality, and are far removed from being commonplace.

The city architect, Mr. Horace Jones, commenced the commercial buildings on the Viaduct with the one occupied by the

well-known photographers, Messrs. Negretti & Zambra, at the corner of Charterhouse Street and Holborn Circus. This was speedily followed by the adjoining warehouse of Messrs. Fearon & Co., and subsequently the Union Bank of London took as a site for one of their branches a plot of land at the corner of Hatton Garden, Ely Place, and Holborn Circus. Now the façades of these buildings were all designed by Mr. Horace Jones, and all bear imprint of his well-known style. The salient features of these three buildings harmonise; the heights of roofs, chimney-stacks, and parapets coincide; the leading horizontal lines of the main cornices, window labels, and shop entablatures are continuous—in a word, there is nothing *bizarre*, but, on the contrary, there is harmony so far as these sections of the Circus are concerned. Londoners began to have some hope that there would be one street in the metropolis of which they might be reasonably proud, and at which foreigners might look without having to restrain their risible faculties. There were a few—a very few—other buildings on the Viaduct which helped to delude the Londoner into the belief that at least he might be proud of his one modern achievement in street improvement. The Imperial Hotel at the eastern end of the street—corner of the Old Bailey—from the design of Messrs. Teulon & Cronk, gave great dignity to the view of the Viaduct as approached from the east. Having regard to the height of the façade next the Old Bailey, as contrasted with its width, I think much credit is due to Messrs. Teulon & Cronk for their judicious treatment of that front. At the western end of the thoroughfare, where the Holborn Circus—a handsome plaza, 170 feet in width—serves as the point from which six different streets radiate, matters architectural did not progress so smoothly, for there appeared on the scene a mighty linen-draper who had to cover a section of the Circus. It might have been reasonably expected that he would have been content to follow the examples already set; and that this would have been required of him in Paris, Brussels, Vienna, or any of the great Continental cities, there cannot be the shadow of a doubt. But the linen-draper determined otherwise, and, doubtless for good reasons as far as his own business was concerned, he resolved to have his premises designed as dissimilar as possible from those already built. Now do not let it be understood that I wish in any way to detract from the merit of Messrs. Lockwood & Mawson's design for the block of buildings I am now referring to. It is one of very many edifices designed by them for commercial purposes, all of them redounding to their credit as architects, and admirably answering the purposes for which they were intended. I am only seeking to show, in pointing to this particular building, how, owing to the absence of proper control on the part of the municipal authorities, this very fine site became spoiled in an architectural point of view. Unity of design having thus been given up as hopeless, matters drifted, so to speak, from bad to worse. The City Bank took another section of the Circus; and, if I may be forgiven the pun, in order to show that there was no union of feeling between them and the Union Bank of London, they must needs have a different façade to their *vis-à-vis*, and so design No. 3 appeared.

In that portion of the Circus lying between Bartlett's Buildings and St. Andrew's Street we have a fourth design, and this unquestionably may be pronounced as the most wretched of the lot. Words, indeed, almost fail to convey the indignation that is properly felt by every educated person in seeing the mode of treatment adopted in uniting the elevation of the side building with that of the front.

I have had prepared for the purposes of this paper photographs showing the various sections of the Holborn Viaduct at present covered with buildings. I regret that it was not possible to take the whole in one view, so that my criticism might have been more easily followed. I have also to express my regret that, owing to the very cloudy weather which prevailed when the views were taken, they are not so sharp and crisp as I should have liked them to be; but, with these drawbacks, they will still serve in some degree to demonstrate how this unquestionably fine site has been murdered, so far as its architectural *ensemble* is concerned.

The remaining section of the Circus—viz. the site at the western corner of Hatton Garden and Holborn—is just about to be covered with a new building. The land in this instance belongs to a woollen-draper, who, doubtless with the view of asserting his independence and of showing that he has as much right to be uncontrolled in the design of his building as his *vis-à-vis* the linen-draper, will sufficiently mark his property and the business carried on therein. To crown all, some one desired to present a piece of sculpture to be placed in the centre of the Circus, and the offer having been accepted by the Corporation, an equestrian statue of the late Prince Consort was decided upon. The Prince is represented in the uniform of a general of the British army, and in the act of acknowledging a military salute. Now, if there was one thing which the late Prince Consort was less than anything else it was a soldier. Neither was he much of a horseman. Yet, forsooth, an equestrian statue having been determined upon, he must be presented to the British public in the guise in which he least often appeared to them. The Prince was a savant and a scholar, and if it were intended to do honour to his memory he should have been sculptured in that character which had most

contributed to familiarise and endear him to the people amongst whom he lived.

As regards the Viaduct proper, the cleared building sites, after lying some time unlet, were sold *en bloc* to a land company. I do not know why it should be, but, nevertheless, it invariably happens that a land company vulgarise everything they touch. Holborn Viaduct was no exception to the rule, for on obtaining possession of the empty sites the land company began to build, if not by the mile at least by the furlong, and with such poor results architecturally that one of their tenants, in order to make his building more pronounced than the original design had left it, conceived the happy idea of painting over the entire front—brick and stone alike—giving the brickwork a nice fiery red tone, and carefully picking in the joints with white lead. I venture to think that anything more hideous could not be found in the unfashionable locality of the New Cut; yet this glaring outrage on good taste has to be viewed daily by thousands of the leading citizens of London.

To conclude, therefore, my remarks on the architectural treatment which this splendid metropolitan thoroughfare has received at the hands of the authorities, I would say that, apart from the extra width of the street, there is little or no improvement over the results obtained by the late Sir Robert Smirke, when called upon to design and lay out two other streets in the City of London, viz. Moorgate Street and King William Street,

(To be continued.)

### THE CONSERVATION OF SIR JOSHUA REYNOLDS'S PICTURES.

THE following is the second part of Mr. J. C. Robinson's paper on Sir Joshua Reynolds's pictures. The first part appeared in *The Architect* on the 2nd inst. :—

Pictures are always at their best when they first leave the artist's easel, and it may be taken for granted that the mellowing tones which time has superadded to nearly all ancient pictures, were neither foreseen nor specially desired by the painters themselves. There is, nevertheless, often a great imaginative charm in this antique *atramentum*, which gathers on the surface of a picture like the patina upon a bronze. Moreover, as "charity covereth a multitude of sins," so this darkling envelope, when not in excess, often serves a useful purpose in mitigating or concealing innumerable evidences of alteration and decay in the work itself. It is the aim, then, of all judicious picture restorers, to retain to a greater or less extent this external crust of dark and discoloured varnish, to prevent its undue accumulation, but never to be obliged to scour it away altogether. Whenever this has been, unfortunately, done, even although the original surface of the picture may not have been in any way injured in the process, a more or less crude and discordant effect is sure to be produced. If it should be asked why this should be, seeing that the picture has merely lost a polluting stratum of superjacent dirt, and that the actual work of the artist has been again revealed in its pristine state, the answer is, that this is not so, for that in the course of time innumerable internal changes have taken place in the artist's work, whereby alone its original effect has been greatly altered and distorted. In nine cases out of ten, indeed, just as the young man of twenty would be astonished if he could see his own presentment at seventy, so would the painter marvel at the transformations of his own work, the inevitable result of natural causes, if he could see it again a century or two afterwards. Some colours, for instance, fade and wane away, while other tints deepen in force and intensity; vehicles darken and become heavy and opaque—in short, there is life or rather death always in operation in pictures, as in everything else—chemical action and reaction, in fact blind forces following their own laws and taking no account of man's intentions, when he pressed them into his service. Thus, in the Mrs. Pelham portrait alluded to in my former letter, the dark tints, even the dark sprigs or flowers on the dress, have undoubtedly become very much darker than they were when they were first painted, while the white drapery remains as white and brilliant as ever. From this cause alone, now that the toned varnish has been produced, a painfully raw and spotty effect has been produced.

It will be evident, then, that this superadded crust of old discoloured varnish, besides the mechanical protection to pictures which it affords, has positive use and value in other not less important respects; it is, then, all essential to be able to perfectly regulate the condition of this crust, and in this consists nine-tenths of the science of the picture-cleaner. Now, pure mastic, which, as I have before said, is the only varnish which ought ever to be applied to oil pictures, in process of time also acquires a more or less warm golden tone, but it never becomes dark brown and opaque or obdurately tough like the oil varnishes. The Mrs. Pelham picture, therefore, if again covered with a sufficient body of mastic varnish, will probably in the course of years gradually acquire again much of the mellow, softening tone which it at present so obviously lacks.

There is, again, another invaluable property peculiar to mastic

varnish; it is that it can be removed with the utmost facility by an extremely safe and simple, yet not the less very remarkable, process. Moreover, by this method it is possible to take away just as much as is required, either all over the surface or in any part of the picture only—in other words, the denuding process can be carried to any desired extent, and stopped short at any point with absolute ease and certainty. This is by simple friction, for mastic varnish when quite dry and hard, possesses the singular property of rolling or chafing up into a fine dust or powder, by mere gentle rubbing with the soft tip of the finger. But oil varnishes cannot be treated in this manner. This invaluable property of mastic is immediately destroyed by the admixture of even a very small modicum of oil, and when the dose is considerable, chafing with the finger has no more effect on the bright, dry surface of the varnish than it would have on that of a china plate or a mahogany table. There is, however, another way of removing varnishes, applicable more or less to all kinds and admixtures. This is by means of solvents, usually alcohol or spirits of wine; but this process, which, unfortunately, is far more expeditious than the former method, is just as dangerous and uncertain in its application as the other is safe and simple. In the hands of ignorant practitioners, indeed, this has at all times been the one paramount cause of the deterioration and destruction of innumerable fine pictures.

Broadly speaking, this process never ought to be resorted to when it is practicable to remove varnish by the former method, and certainly never by any but a thoroughly experienced manipulator.

Another operation to which it is often necessary to subject pictures is what is called back-lining, and here again Sir Joshua Reynolds's pictures are especially difficult to deal with. This process is resorted to when the painted film of the picture rises up into blisters or cracks, and becomes loosened from the canvas. It is performed as follows:—The face of the picture is, in the first place, protected with several sheets of paper pasted on it; the canvas is then cut off the stretching frame, and placed with its covered face downwards on a smooth wooden table; a new canvas is then glued or pasted on to the back of the old one, and made to adhere very strongly by pressure in all parts with a heated iron. By this heat and pressure the blisters and loose portions of the paint are flattened down and made to adhere again to the canvas. The picture thus fortified is then again strained upon a stretcher, and the sheets of paper pasted in front are washed off with warm water and a sponge. But Sir Joshua's pictures are usually so thickly painted, their surface texture so rugose, and the sharp loaded touches stand up in such high relief, that the heat and pressure required to bring down the cracks and blisters are liable at the same time to flatten these loaded touches, or even—especially when wax has entered into the composition of the bituminous pigments—to actually melt them and cause portions of the picture to run into blurred and formless masses. There are, then, numerous cases in which back-lining is the obvious remedy for evils which have supervened upon Sir Joshua's pictures, but where for these reasons it is impossible to apply the remedy with safety. In short, it is scarcely too much to say that they should never be either back-lined or entirely "stripped"—that is, cleaned from all the varnish put upon them. In the majority of cases the injuries they have suffered should be regarded as bygone evils, irrevocable in their nature, to be atoned for or kept from further development only by increased and more rational care in future.

There is yet one other technical matter to be noticed—this is as to the action of solvents—that is, alcohol or spirits of wine—both on the covering varnishes and on the denuded surface of pictures. Broadly speaking, spirits of wine dissolve the super-added varnishes almost instantaneously, if these are of a purely resinous nature, and as the delicate final painting and transparent glazings of the artist are usually executed with more or less resinous media, these also may be blurred and defaced, or even utterly scoured away, in the briefest instant even, by the ignorant or unskilful cleaner. Unhappily, this is still of every-day occurrence, and woful instances are before our eyes in the exhibitions now open at the Grosvenor Gallery and Burlington House.

Let us now turn to some of these examples. Perhaps the most flagrant cases are to be seen at the Royal Academy. The "Old Masters" Exhibition this year, in fact, contains an unusual proportion of damaged and "restored" pictures. Two capital works of Sir Joshua Reynolds are unluckily among the most obvious instances. The first of these is the beautiful portrait of *Mrs. Sheridan as St. Cecilia*, No. 209. Here the head of the lady has been cruelly flayed, nearly all the delicate surface modellings, originally executed in transparent glazing colours, have been ruthlessly scoured off. The head is now, comparatively speaking, a flat and formless white spot, quite out of keeping with the rest of the picture; the white drapery, moreover, has been flattened down by a partial lining process, and fatally blurred by solvents. The picture had doubtless been allowed to lapse into a degraded condition, and its "restoration" would have probably sorely taxed the skill and patience of even the most accomplished "picture doctor." As it is, in an evil moment this famous work must have fallen into the hands of an ignorant and reckless quack. Worse than this, however, is No. 18 (Royal Academy), *Hope Nursing Love*. This

picture has been completely transformed—practically ruined—mainly by improper and unskilful back-lining, and apparently by an empirical method of "reviving" the flattened surface by solvents. The picture obviously looks as if it had been half-melted or dissolved; and so, in fact, it has. All the sharp and brilliant touches of the master have disappeared; they seem, indeed, to have partly sunk into and become absorbed in the thick, semi-fluid impasto of the picture, and partly to have been removed by abrasion. The result, in any case, is that the work has been reduced to a tame and monotonous dead level.

It is a thankless task to point out such instances as these, and sympathy with the unfortunate owners alone indisposes me to dwell upon them. One other flagrant case, however, I cannot pass over. This is No. 11 (at the Grosvenor Gallery), the portrait of *Mrs. Nesbitt as Circe*. Here, again, is another completely defaced work—the pale ghost of a noble picture. Truly in this case it is the swine which have transformed the enchantress! This picture has been simply flayed, except perhaps in some portions of the dark background in the upper part; the surface glazings and much, indeed, of the solid painting of the picture have been cleared off bodily by the reckless application of solvents. The work, nevertheless, must previously from all appearance have been substantially in a sound and healthy condition. I shall now only call attention to one other picture, and this not that it has yet suffered irremediable injury, but simply because it is on the road to ruin, and that a friendly hand might rescue and give it renewed life and beauty. This is No. 123 (Grosvenor Gallery), the portrait of Lady Caroline Keppel. I stated in the outset of my former letter that a sufficient "body" of varnish is absolutely necessary to protect the surface of pictures, particularly in the changeable climate of England. But all varnishes are liable to decay and alteration in the lapse of time, and to require renewal. Thus, from the poverty or insufficiency of the protecting medium alone, serious evils may ensue. Now, the charming portrait in question is in this particular condition. The picture appears to have received, probably not long after it was painted, one or two thin coats only of oil varnish, and to have ever since remained practically untouched. This covering has somewhat darkened and changed colour, but not to any serious extent. It is now, however, rapidly decaying and becoming loose and friable, and almost ready to drop off the surface. The simple remedy for this is to give the picture a sound coating of pure mastic, simply applied over the ancient crust as it stands; nothing else is required. This could easily be done during the continuance of the present exhibition even. This delightful work would then not only be rescued from imminent degradation and decay, but the resultant effect would be quite surprising, for the picture would doubtless again "bear out" in almost its pristine force and brilliancy.

It will now perhaps be asked, "But what is to be done with pictures covered with darkening oil varnish, but which for the reasons stated it is inadvisable to try to remove?" The simple answer is, Let them alone. But, curiously enough, there is a possibility, if not of completely remedying this ever-increasing darkness, yet to some extent of arresting its progress. It is a well-known property of drying oils, especially of linseed, to carbonise or increase in depth of colour most rapidly in the dark, and, *vice versa*, a bleaching process takes place by exposure to the light. Generally speaking, then, although the direct rays of the sun ought never to be allowed to fall on oil pictures, on the other hand they should never be hung in very dark situations. Now, if any picture obscured by oil varnish, and which may have been previously hung in a position comparatively sombre, is removed to a more lightsome situation, the tendency in the oil varnish to become increasingly dark will be counteracted, and probably the work may even to some extent recover some of its pristine lightness. A useful hint to possessors of pictures may be gathered from this brief intimation. It is this: rooms in which pictures are hung should never be left for months together with closed shutters, as is sometimes the case in houses shut up for the season; nor should the careful housewife ever be allowed to cover them up with calico or brown holland, and this even more for the reason now given than for the risk of fire so induced, by which so many lamentable catastrophes have been caused. There now remains only one more point to notice before bringing to a close these unavoidably prolix observations. It is the practice of putting pictures under glass. I am glad to find from the number of instances seen in the present exhibition that this most useful practice is on the increase. Nothing can be better or more conducive to the proper preservation of pictures than this simple plan. There are, it is true, some practical drawbacks to its universal adoption, and before concluding I shall notice the most obvious and perhaps the only really cogent objection. But covering the face of the picture with glass is only a half measure; the back of the canvas requires protection from accumulations of dust and dirt, and the access of damp air, almost as much as the painted surface. The right course is also to cover the back with some material impervious to moisture, such as American or indiarubber cloth, stretched tight across and nailed along the edge to the frame of the picture.

It is scarcely necessary to enumerate the advantages accruing from the protection of pictures by glass; they are for the most

part obvious enough. One only, however, which may not be generally perceived is this—this plan almost entirely obviates the necessity for the periodical rubbing up and cleaning the surface of pictures with the silk handkerchief or cotton wool, inasmuch as the protecting glass and not the painted surface of the picture receives the rapidly accumulating deposit of dust and dirt. Now, the very act of frequently rubbing up the surface of pictures is in itself prejudicial, especially to those painted on canvas. It is, indeed, one of the causes of cracking and the loosening of the painted film, which is of all things most to be avoided. Finally, in the case of pictures of comparatively small dimensions, I can see no practical reasons worth a moment's consideration against putting them under glass, and I can call to mind only one really valid objection against treating works of large size in the same manner; it is this, that the greatly increased weight caused by the thick sheet of glass renders it comparatively difficult to move such works with the desired facility. This, indeed, in view of possible alarm of fire, is a matter to be considered; it is clear, however, this is not an insuperable difficulty.

### WESLEYAN CHAPEL BUILDING.

THE twenty-ninth annual report of the Wesleyan Methodist Chapel Committee, whose headquarters are in Manchester, has been issued. The management of chapel affairs is divided into two departments—building department and relief department. Under the building department there are two classes of cases—erecting and enlargements sanctioned during the year, and erections completed which had been sanctioned in previous years. The following enlargements and erections have been sanctioned:—113 chapels, at an estimated cost of 173,354*l.*; seven ministers' houses, at an estimated cost of 6,858*l.*; 24 schoolrooms, at an estimated cost of 11,110*l.*; 109 alterations and enlargements, at an estimated cost of 57,418*l.*; 94 modifications of cases previously sanctioned, viz., 76 chapels, additional outlay, 29,953*l.*; 17 alterations and enlargements, additional outlay, 4,457*l.*; 39 organs, 9,011*l.*—making together 386 cases, at an estimated outlay of 292,174*l.* The number of cases sanctioned this year is seventeen more than last year, and the proposed expenditure is 41,743*l.* more than the outlay then sanctioned. The average cost for sitting in the intended new chapels is estimated to be just over 5*l.* Of the proposed new chapels, 55, to accommodate 14,306 hearers, are to be erected in places where there were previously no Wesleyan Methodist places of worship; and 58, estimated to provide accommodation for 20,178 hearers, are to supersede former erections reported as having provided 12,553 sittings. The total additional accommodation in new chapels and enlargements will be 24,793 sittings. The temporary debt sanctioned is 32,854*l.*, being 18 per cent. on the outlay.

### THE ROYAL SCOTTISH ACADEMY.

THE annual dinner was given by the President and Council of the Royal Scottish Academy on the 15th, Sir William Fettes Douglas, president, occupied the chair.

Lord Balfour, of Burleigh, proposed the toast of the evening—"The Royal Scottish Academy." After referring to the hospitality they had received, and to the admirable works of art they had had the opportunity of witnessing, he said that not from his own opinion, but by having gathered the opinions of those best able to judge, the present exhibition was fit to be compared with any of those which had preceded it. They lived in times when they might congratulate themselves upon the spread of real artistic knowledge among the people at large. They must all be gratified at that, and he was not wrong in saying that a good part of the spread of that knowledge was due to the position which the Royal Academy had taken up in Scotland. A great deal was being done by art to elevate the tastes of the people, to show them that art was not a thing for the rich alone, but for all classes, and that by taking it into their dwellings they made their dwellings homes, and not merely places to live in. In London there was a National Gallery, of which the nation might well be proud; but the less said about what had been done for art in Scotland the better. He hoped, however, there were better times in store for Scotland, and that more justice would be done to her in such matters.

Sir Wm. Fettes Douglas, in replying, said that the Royal Scottish Academy dated from nearly sixty years ago, and was instituted out of the external necessities of art. But although sixty years ago art was in a very necessitous state in Scotland, now art was a necessity of itself in every walk of life and in every circle of society. He believed Lord Balfour was not far wrong in saying that art in Scotland owed much to the Academy. He thought all the schools in the world would not do so much for aspiring artists as the sight of good pictures always before them; and if the Academy had money to spare he would strongly recommend it not to spend it on more schools of art, but in the purchase of more good pictures. He then referred to the spread of artistic taste in home life, and said that from engravings and

chromo-lithographs people, as their ability and taste improved, aimed at securing better art productions. Lord Balfour had mentioned the National Galleries of England and Scotland. That was a subject on which he could enlarge with considerable emphasis, although he was not quite sure whether he was at liberty to say much about it. There was no doubt, however, that in Scotland they had been infamously treated. The National Gallery in England had—and very properly—20,000*l.* or 25,000*l.* a year, and Ireland also got over 3,000*l.* and had its Gallery buildings erected for it, while in Scotland not a single sixpence of national money was spent upon art. Even the cost of the National Gallery Buildings themselves was taken out of a purely Scottish fund. In conclusion, the President referred to the success of the Academy scholars of the present time, and prophesied, amid cries of "No," that the painters of the future would be infinitely better men than those of the present or past.

### EDINBURGH CASTLE.

ON Saturday last the members of the Edinburgh Architectural Association paid a visit to the Castle, with the view of examining some of the architectural features of the building. The party, which was a numerous one, met on the Esplanade, and was afterwards conducted through the more interesting portions of the Castle buildings by Major Gore-Booth.

Mr. David M'Gibbon, president of the Association, read a paper on the Castle in Queen Mary's Room. After referring to a few prominent historical events associated with the early history of the Castle, he said that what the appearance of the Castle was in these early times they had no means of knowing, as it was entirely demolished by Bruce in pursuance of his usual policy of leaving no place of strength standing which could form a point of support to the enemy. The only building of the early period which appeared to have escaped was the small chapel in the Norman style called St. Margaret's Chapel, which was probably founded by David I., the great church-builder, in memory of the sainted queen; at least it belonged to the latter half of the twelfth century. From the natural configuration of the gate, the general disposition of the various parts must have always been much the same. The entrance would always be by the same narrow pass by which the Castle was now approached. This would lead to the outer or lower court, where the governor's house, the barracks, armoury, &c., were now situated, while the inner court would occupy the highest point, where the palace yard now was, the only access to which seemed to have been by a flight of steps in the face of the rock. The Castle was rebuilt by Edward III. in 1344. It was most probable that the buildings would be erected in the same style as the numerous fortresses built by the Edwards in Wales—viz. a great enclosing wall with towers at intervals. There would be comparatively slight erections within the *enciente* for the garrison, but no large building for a residence. When David II. returned from his captivity he made the Castle his chief residence. He added greatly to its fortifications, and built a large keep, called David's Tower, which occupied a position above where the Half-Moon Battery now stands, and which remained till the siege by Drury with the English troops in 1573. David's Tower was evidently (1668–71) the keep or chief building in the Castle. It was 60 feet in height, and contained a lords' hall and a new court kitchen, besides chambers and lofts. After the town of Edinburgh was burned by the Duke of Lancaster (1385)—the Castle having resisted the siege—Robert II. gave permission to the townspeople to build houses for security within the Castle walls, which must therefore have been of considerable extent. The Jameses resided chiefly at Edinburgh Castle, and it would appear that they considerably extended the accommodation by building a hall and royal apartments at the south-east corner of the Castle Rock. This building was well seen from the Esplanade, and it might be well to observe the corbels which marked the former height of its parapet. The top storey was evidently a late addition. Considerable additions were made to these royal apartments at various times, especially during the reigns of Queen Mary and James VI., some of which still remained. It was in Mary's time that the Castle sustained the greatest injury (when it was held for the Queen by Kirkcaldy of Grange), and when almost all traces of its earlier form were obliterated. It was from the date of the rebuilding of the Castle by the Regent Morton after the siege that the existing modern appearance of the Castle began. Commencing with the Esplanade, it should be kept in mind that its present extended appearance was of very modern date, having been formed with the rubbish removed from the site of the Royal Exchange when it was built in 1753. Before the siege of 1573, this ground was at the level of the dry ditch, and was occupied with a triangular court bounded by a wall called the "spur." This was removed in 1649. After its removal, and before the formation of the Esplanade, the Castle was approached by a narrow raised roadway and a drawbridge at the gateway. The Half-Moon Battery was the chief feature erected by the Regent Morton after the surrender of the Castle. David's Tower was supposed to have stood about the centre of it, and the remains of one of the old

smaller towers and part of the curtain wall might be traced embedded in the masonry of the present building. The arched gateway was built by Regent Morton below the site of the Constable's Tower. Formerly it had a flat crenellated roof for artillery—the present top storey being a modern addition. The mouldings quite corresponded with those of the period (1574) at Craigmillar, &c. In the entablature alternating with the triglyphs might be seen the Heart and Star of the Douglas. On passing through the archway a flight of steps was seen on the left, indicating where the original access to the upper platform by the Constable's Tower probably was. Passing the Argyle Battery, they had before them the Governor's house, built in Queen Anne's time, and on the right a passage flanked with two quaint vases leading to the armoury and stores. These plain buildings were of the eighteenth century. The great block containing the soldiers' barracks was built at the beginning of this century. They now ascended to the upper platform, on which the principal parts of the Castle had always stood. Commencing at the quadrangle, they found the oldest portions of the south-east corner immediately over the most precipitous parts of the rock. These consisted of the private apartments of the palace already referred to as belonging originally to the fifteenth century. Dr. Chambers thought they could trace the remains of an ancient tower at the south-east angle, which might have been the primitive palace of Malcolm Canmore; but as the Castle was entirely dilapidated in the time of Bruce, they could not fix on an earlier date than that of the Jameses for the building of any portion of this palace. The width of the platform of the courtyard seemed to have been extended at an early date by building extensive vaults to the southwards, in some places two storeys in height, so as to raise the pavement of the courtyard to near the top of the wall of the *enciente*. Above part of these vaults the Great Hall, called also the Parliament House, had been erected, apparently at a subsequent date, for it should be noticed that the hall did not occupy the full width of the vaults. The hall was 84 feet long by 33 feet wide, and seemed to have been originally lighted by large mullioned windows on the south side, some traces of which still remained, and there were probably similar windows on the north side, but the building had been so much altered that it was now scarcely possible to recall any of its original features. The gabled crowsteps which still remained on the west gable were evidently original. The roof of the hall was old. Of the corbels which supported the ends of the principal rafters only one was now visible—in the staircase. It was of fine Renaissance design, and of a style very rare in Scotland. The corbel and the gabled crowsteps were almost the only features in the building from which an idea of its date might be formed. Judging from these and the parapet on both sides, the date of this could scarcely be earlier than the reign of James V. It seemed probable that the roof was of the same period. This must have been a magnificent hall of a similar type to those of other royal palaces at Linlithgow and Stirling; and it was earnestly to be hoped that the meritorious and enthusiastic endeavours of Major Gore-Booth to have it so far as possible restored and fitted up as an armoury and military museum might be crowned with success. According to the usual arrangement of such palaces, the hall communicated with the princes' private apartments at one end—in this case the east end; but these had also been so much altered that it was impossible to distinguish the original arrangements. The vaults beneath this range were said to have been used as State prisons, one being called Argyll's dungeon. At all events, there was no doubt that they were employed for the purpose of confining the French prisoners at the beginning of this century. Proceeding to the east wing of the palace, here were the apartments occupied by Queen Mary, and the room in which King James VI. was born. This wing was renovated in Queen Mary's time. The entrance door and interior fittings were evidently of her date, and over the door there is a monogram of M. and H., for Mary and Henry Darnley, besides a shield higher up containing the royal arms. The two corbelled projections opposite the eastern windows of this division were noteworthy. It was said that they supported balconies to which access could be got from the windows; but it seemed to be more probable that they were intended to support oriel windows such as that in the private apartments at Linlithgow. The northern part of this wing was in fair preservation, and bore the date 1615, with which date its style corresponded, being somewhat similar to that of Heriot's Hospital and the old Parliament House. The mouldings and their details had not escaped from the effects of the subsequent sieges by Cromwell and others to which the Castle was subjected; but as none of these were of a very serious character, the buildings erected after the date of the Regent Morton had suffered more from violence from within than from without. This block contained the regalia-room, which appeared to have been constructed as a strong-room for keeping these insignia in safety. On the north side of the quadrangle stood originally the Garrison Church, founded as early as the time of David I., and afterwards rebuilt, shortly before 1366, by David II. The buildings on the west side of the courtyard were evidently very modern—probably about the beginning of the last century. Passing to the northern portion of the upper platform, here the little chapel of St. Margaret has stood uninjured all the other shocks and changes which had so

altered the other features of the Castle. But it had suffered severely from internal alterations. It has now, however, been restored to its original shape and use, and is certainly one of the most unique and interesting specimens of Norman work in Scotland.

### THE BUILDING OF LONDON HOUSES.

THE first of a course of three Cantor Lectures was delivered by Mr. R. W. Edis, F.S.A., on Monday evening, at the house of the Society of Arts. The subject selected was the "Building of London Houses." Mr. Edis began by pointing out the hopelessness of any real improvement in the building of London houses until effective legislation brought the "speculative builder" under such control and supervision that he should be obliged to give up the scamping work, the defective materials, and the utter disregard of all sanitary requirements which now characterise 99 per cent. not merely of existing structures, but of the enormous additions which annually take place. It was true that within the last few months the Metropolitan Board of Works had seen the necessity of supervising plans; but their supervision only applied to buildings carried out on their own property. If Government could not take up the matter, surely it would answer the purpose of a private company to undertake the work of inspection on a large scale. It had been his lot to examine many houses of the so-called better class of speculative buildings. In these the unfortunate tenant saw the rooms carefully painted and papered, and only found out the wretched whitened sepulchre he had taken after the agreement was signed. Probably only one per cent. of London houses were erected under a competent architect. Another fertile cause of the existing undesirable state of things is the grasping propensities of ground landlords and the leasehold system, which led to the erection of houses on unsound principles, and of materials wholly unsuited to the London atmosphere, and it was sincerely to be hoped that some law would soon be passed making it compulsory on ground landlords to enfranchise building owners on equitable terms. The health and comfort of the inmates should be first considerations in the internal plan of a house, and to these the external elevation should be made subservient by insuring the maximum of light and air. These desiderata, as well as agreeable outside appearance, would be secured by projecting octagonal oriel and bay windows and gables cutting up the sky-line, as in the streets of many of the old towns of Belgium and Germany. As to materials, cement and stucco might be accepted as merely screening bad work, and for new houses the best materials were glazed bricks, which were impervious to moisture, and the extra first cost was more than repaid by the extra light, warmth, and purity of air which they insure. Good red bricks, with plenty of red terra-cotta and glazed faience, put together in the Elizabethan style, was infinitely more charming and more suitable to London wants than the best stone (which did not stand the smoke) worked up into Classic, Gothic, or the Italian palatial style. One thing was certain, that rows of houses which were weak imitations of the Rue de Rivoli or l'Avenue de l'Opéra in Paris were not wanted in the metropolis.

### THE INTERNATIONAL HEALTH EXHIBITION.

PREPARATIONS for the holding of this exhibition are proceeding rapidly. The Board of Trade have certified that the exhibition is an international exhibition, and exhibitors thereat will accordingly participate in the privileges accorded by the Patents, Designs and Trade Marks Act of 1883. The officers of Her Majesty's Customs have also announced that the Lords of the Treasury have consented to the buildings being considered as a bonded warehouse during the continuance of the exhibition, as was the case at the late Fisheries Exhibition.

The general committee now numbers nearly four hundred members, and from these seventeen sub-committees have been formed. These have all been doing valuable work in advising the executive council as to the nature of objects which it is desirable should be fully illustrated, in obtaining the co-operation of many persons of eminence in the various branches on which the exhibition will treat, and in supervising the applications for space.

The allotment of space, which has been largely applied for, is being rapidly proceeded with, and applicants will soon be informed of the decision of the executive council with regard to their applications. Though it is impossible to state, at this early stage of the preparations, the names of exhibitors, we are however in a position to say that many well-known London and provincial firms—whose very names are a guarantee that their exhibits will be prepared in a first-rate manner—have announced their desire to take part.

In response to a request made by His Royal Highness the Prince of Wales, president of the exhibition, the eight water companies of London have resolved to exhibit, in a pavilion which is being erected for them, their appliances for the supply, filtration, &c., of water, together with diagrams showing the various processes and localities; and a powerful sub-committee

under the active chairmanship of Colonel Sir Francis Bolton, has been formed to carry out this branch of the exhibition. The water companies have also determined to put up in the grounds a large fountain, which will be illuminated at night by electricity. This fountain of light will, it is anticipated, materially add to the beauty of the illumination of the gardens.

It is impossible as yet to give any definite information with regard to foreign countries, but so far as one can judge at present, Belgium, China, and India will be the best represented. A Royal Commission has been appointed in Belgium, and the Consul-General in London is their active representative here. To China has been allotted the space which it occupied last year at the Fisheries Exhibition, and a Chinese tea garden, restaurant, and shop will not be the least interesting objects in the exhibition. India is to be adjacent to China, and strenuous exertions are being made to secure the united action of many of the principal tea-planters in India, so as to insure a good and representative show of the Indian tea-growing industry.

## BRONZE CASTING IN BELGIUM.

THE following technical description of the method of casting bronze "*à la cire perdue*," as carried on by the *Compagnie des Bronzes* at Brussels, has been prepared by Sir J. Savile Lumley.

Supposing the work to be reproduced to be the portrait bust of a man with curly locks and a long flowing beard, such a head would not be easy to cast by the ordinary process owing to the difficulty of conveying the liquid bronze into the cavities of the curls and the interstices of the beard, but this is easily overcome when the bust is cast by the wax process. The different operations to be carried out are as follows:—1. The production of the model in plaster or terra-cotta by the artist sculptor. 2. Its reproduction in wax by the founder. 3. The repairing and retouching of the wax bust by the artist sculptor. 4. The preparation for casting the bust before forming the mould and cope. 5. The formation of the mould. 6. Firing. 7. Casting. 8. Finishing and decorating the bronze bust.

### 1. The Model.

The bust produced by the sculptor, which may be in terra-cotta or plaster, finished as far as the artist thinks advisable, is handed over to the founder.

### 2. The Reproduction in Wax.

This requires three distinct operations:—A. The formation of a piece-mould; B. The reproduction of the bust in wax C. Running the core.

#### A.—The Formation of a Piece-Mould.

After having examined the bust so as to be thoroughly acquainted with its difficulties, the workman proceeds to cut off with a twisted wire the projecting portions of the beard and the hair which, from the cavities of the locks and curls, would present difficulties for casting. The parts thus removed are afterwards easily replaced. The bust is now reduced to a very simple instead of the complicated form it at first presented. The plaster mould is then made in the ordinary way: the bust being laid on a table, face upwards, is fixed in that position by lumps of modelling clay so that one half of the thickness of the bust is completely covered, the remaining half presenting the appearance of a figure floating on its back in water. The workman then begins to make the pieces of the mould: taking the liquid plaster, which is of the consistency of thick cream, he forms a cube of 5 centim. high, and the same length and width, which he squares as soon as the plaster begins to harden; with this cube of plaster he covers a first portion of the surface of the bust; close to this first cube a second is formed, and so on till the whole bust is covered with an irregular mosaic of plaster cubes, care being taken to prevent them from adhering to each other, or to the bust by the application of a strong solution of soap. The surface of these cubes, after being well wetted with this solution, is covered over with a very thick coating of plaster, which is called the cope, the place of each cube having been previously marked; the first half of the piece-mould is now complete. The moulder then turns the bust with the face down on to the table, fixing it as before, and proceeds to cover the back in the same way with cubes of plaster, so that when this second half is also covered with a thick plaster cope, a complete mould is formed in two halves. The great art of the moulder is to make the piece-moulds at the same time simple and solid, and fitting so closely together as to leave the least possible trace of the joints on the plaster cast produced from it; care must also be taken that in handling the mould none of the small pieces should detach themselves from it.

The mould being completed, it is opened, that is to say, the two plaster copes are separated, the bust which is intact is taken out, leaving a complete mould in which other busts can be cast just as bullets are cast in a bullet-mould.

The next operation is the reproduction of a bust in wax, precisely like the original in plaster.

#### B.—Reproduction in Wax.

One half of the piece-mould is placed on the table, that is to say, one of the copes, with all its pieces, and the mould is wetted with water in order to prevent the wax from adhering to it; the workman then, with his thumb, presses wax into all the hollows of the mould—this is an operation of considerable delicacy. The wax, which must be very pure and malleable, is affected by the weather, working more easily in summer than in winter. The most suitable quality for average temperature is composed of 1 kilog. of yellow wax, 6·200 kilog. of mutton fat, 0·100 kilog. of white pitch, melted together and coloured a deep red with orcanette root.

The wax pressed into the mould should be 2 millim. thick. When all the hollows of the first cope have had wax of the requisite thickness pressed into them, the same process is applied to the second cope; the two copes, on being united, form a complete mould; they are then tied together with strong cords, and the joints of the copes are smeared with clay so that the mould should be watertight.

In the meantime another description of wax of harder consistency, composed of 1 kilog. of yellow wax, 1 kilog. of resin, and 0·250 kilog. of Venetian turpentine, has been melted in a cauldron and allowed to stand on the fire until the froth has subsided.

The wax being ready is allowed to cool to 60 or 70 degrees centigrade, when it is poured into the mould, which it fills, and is allowed to remain there for 40 seconds; the liquid wax is then poured out of the mould into a bucket prepared to receive it. On examining the interior it will be found that the soft wax which was pressed into the mould has received throughout a coating of strong wax 3 or 4 millim. in thickness, making an entire thickness of 5 or 6 millim., which will be the thickness of the bronze when cast.

#### C.—Formation of the Core.

The core is the substance with which is filled the hollow left in the mould after the liquid wax is poured out of it. If the bust were cast in bronze without a core it would come out solid and weighing ten or fifteen times heavier than is necessary, and the casting itself would be faulty owing to the great shrinkage produced by such a mass of molten metal, which would also have the effect of vitrifying the earths forming the mould. The core is, in fact, indispensable in the reproduction of artistic bronzes. The core in use at the Brussels *Compagnie des Bronzes* is formed of a mixture consisting of two parts of fine plaster of Paris and three parts of a pulverised earth composed of quartz sand, thin argillaceous clay with traces of iron oxide, carbonate of lime, magnesia, and potash, mixed together with pure water, forming a liquid paste which is called "*potin*," and which, like plaster of Paris, hardens very rapidly.

Having calculated the capacity of the hollow left by the wax, a quantity of "*potin*," sufficient to fill it, is prepared and poured into the hollow, leaving enough of the mixture to form a pedestal projecting about 10 centim. from the bottom of the bust. The core, having been thus poured into the hollow, is left to harden.

Before proceeding further it is necessary to describe the means by which an escape is provided for the air or gases of the core, which, if not set free, might destroy, twist, or otherwise injure the bronze.

This is effected by what is called, in the language of the foundry, a "*lanthorn*" or chimney, by which the core of every work in bronze must communicate with the external air. The core being composed of porous matter, it is easy to understand that when the molten metal enters the channel prepared for it, the core being completely isolated and superheated, the gas within it is violently dilated, and would force a passage through the fused metal if a vent were not prepared for it. If, owing to an accident or faulty arrangement, the lanthorn should not act, the bronze figure containing the core would be inevitably bulged and distorted, and would have other defects which would considerably diminish the value of the work.

In the case of the bust already described, when the piece-mould is emptied of the liquid wax that has been poured into it, and just as the "*potin*" which is to form the core is about to be poured in, a round stick, about 16 millim. in diameter, having a pin or iron point at the end, after being well oiled, must be fixed into the centre of the hollow of the bust, so that the pin should project through the wax of the top of the head. The stick must be held in this position while the "*potin*" is poured in round the stick, and when the "*potin*" begins to harden, which it will do in a few minutes, the stick is twisted out, leaving, of course, a hollow the size of the stick traversing the bust from the base to the head. After the artist-sculptor has retouched the wax bust, the mark left by the point of the stick is sought, and sufficient wax is removed round it to permit of a small iron tube of the same diameter as the hole left by the stick being forced 2 or 3 inches deep into the head, leaving, however, a portion projecting from the head and beyond the block-mould when it is formed over the wax-bust.

Any crack that may appear between the tube and the hole is carefully closed, and the wax is retouched where the tube projects from the head.

If the tube were not forced sufficiently into the head, or if the joint were not properly closed, the molten bronze would find a passage and fill up the chimney left for the escape of air from the core—an accident which would give rise to effects like those above referred to.

In complicated pieces the proper formation of the lanthorn is of the greatest importance; it is often difficult to arrange, and requires considerable experience to make and place it properly.

I am unable to give the precise proportions of the earths of which the "potin" is composed, which is in fact the only part of the process concerning which any reserve is shown.

The mould is then placed on the table, the cords are unfastened, the clay closing the joints of the two copes is removed, and by inserting a wedge between the two copes the upper cope is carefully lifted off. The workman then removes one by one all the little pieces forming the mould, exposing the corresponding parts of the bust in wax. When all the pieces are removed from the front, the bust is placed upright on its base of "potin," and the cope covering the back is then removed in the same way, together with the pieces forming the mould.

These pieces are then carefully returned to the cope each in its place, and the mould when put together again is ready to be used for another wax bust when required.

The bust now appears in wax reproducing exactly the original bust in clay, with the exception of the seams from the joints of the mould, which are then removed by the artist-sculptor himself.

Although wax is neither as easy nor as pleasant a material to work in as modelling-clay, a very short time suffices to enable the sculptor to manipulate it with facility, and an opportunity is afforded him of giving the finishing touches to his work with still greater delicacy than in clay.

It is at this period that the beard and curls of the hair which were removed before making the mould, and which have been separately reproduced in wax by the same process, are fixed in their respective positions by iron points which are driven through the wax into the solid core, and hold the pieces firmly in their places; the artist then going over the joints with a modelling tool renders them invisible.

(To be continued.)

## WORKS IN PROGRESS.

**Bleam Union Workhouse, near Canterbury.**—All the closets in this workhouse have been fitted by Moule's Patent Earth Closet Company with their self-acting apparatus, and are giving great satisfaction.

**The Indestructible Paint Company,** of 27 Cannon Street, London, E.C., are supplying "Browning's" patent paint, manufactured by them, for the whole of the work for the repainting of the workhouse and infirmary, St. Mary Abbott's, Kensington.

**Messrs. Diespeker & Co.,** 40 Holborn Viaduct, who have lately finished the mosaic flooring at St. Leonard's Church, Berwick St. John, Wilts, and St. John's Church, Clapham, are now at work laying the mosaic in the new Art Gallery, Wolverhampton; and have also nearly finished the mosaic at St. Saviour's Church, Paddington, of which we shall shortly give a fuller notice. The same firm have been laying a very fine piece of mosaic work for Lieut.-Col. J. Hamilton, M.P., embodying that gentleman's coat of arms.

**The Trinity Corporation** have just completed the series of tests to which the various samples of colza oil are each year subjected, and have placed the contract for the ensuing year with Sir A. W. Rose & Co., oil refiners, of London.

**Messrs. C. Isler & Co.** are at present boring at Cliffe, near Gravesend, for the Brick Company, having reached the depth of 158 feet. It is contemplated to go 250 or 300 feet to obtain fresh water. At the E. C. Powder Co.'s new works at Bean, near Dartford, they have just completed a 300-foot well, 208 feet of which is 6 feet in the clear, and the remainder 92 feet 8½ inches in diameter. The water level stands at 209 feet from the surface, and the supply obtained by hand-power is 2,500 gallons per hour.

**The Ancient Church at Wath,** near Ripon, North Yorkshire, having lately undergone restoration, has just got two other improvements—one in the shape of a new stained-glass window, the other in the shape of a large clock with two outside dials of solid cast-iron, with sunk centres and raised figures and minutes. The grounds of the dials are painted black; the hands, which are of strong copper, along with the figures and minutes, are gilt; one dial facing the rectory, the other down the Ripon Road, towards the court-house. The clock is constructed on a solid cast-iron bed frame, which is planed; all the bearings, of gun-metal, screwed into the frame, so that each or any wheel can be taken out in case of alteration or accident. The escapement is the double three-legged gravity by Sir E. Beckett, Bart., maintaining power on the bolt and shutter principle, and all the latest improvements inserted. The clock, which was manufactured by Messrs. Wm. Potts & Sons,

of Guildford Street, Leeds, was started by Sir Reginald Graham, Bart., of Norton Conyers. Messrs. Potts & Sons, of Leeds, started a similar clock with one dial at the parish church, Hemingford Grey, St. Ives, Hunts., on February 14, 1884.

**Messrs. Le Grand and Sutcliffe,** of 100 Bunhill Row, have received instructions to supply their Norton's patent registering turnstiles, and also the non-registering and exit cage turnstiles, for the Liverpool Zoological Gardens. The simplicity and accuracy of the recording indicators of these well-known turnstiles has led to their general adoption at all places of public resort where it is desired to keep a correct record of the admissions. The turnstiles referred to above are made somewhat more ornamental than the usual pattern by the introduction of bright brass arms.

**The Improved Wood Block Flooring** made by Mr. Roger L. Lowe, of Farnworth, has been specified on the following works, viz.:—Floors and corridors of the Hyde Town Hall (Mr. J. W. Beaumont, architect, Manchester); floors of the Birkenhead Town Hall (Messrs. C. O. Ellison & Son, architects, Liverpool); floors of the Nicholson Institute, Museum, and Free Library, Leek (Messrs. W. Sugden & Son, Architects, Leek); floor of Hatchett's Hotel, Piccadilly, London; floor of the Bon Marché, Liverpool (Messrs. Aldridge & Deacon, architects, Liverpool); floors of large new offices for M. S. & L. Railway Company, Great Grimsby Docks, Lincolnshire (Messrs. Mills & Murgatroyd, architects, Manchester); floors of new church at Runcorn, and also at Adlington (Messrs. T. D. Barry & Son, architects, Liverpool); floor of Messrs. Mort's printing office, Stafford (Mr. R. Griffiths, architect, Stafford); floors of large hotel extensions at Derby, for Midland Railway Company (Mr. J. H. Saunders, architect, Derby); floor of new church at Whitby, Yorkshire (Mr. R. J. Johnson, architect, Newcastle-on-Tyne); the whole of the floors for The Cottage, Bradford, near Reading; floors for the magistrates' rooms at the court-house, Wakefield (Mr. J. V. Edwards, West Riding County Surveyor); and many others.

## Caution to Architects.

SIR,—In the interest of architects, their clients, and ourselves, we feel called upon to state that having had a number of complaints made to us respecting the inefficiency of our patent self-acting air-pump ventilators, we have upon examination of the ventilators complained of found that they were not our ventilators, though ours had been specified to be used, the contractors having, for greater gain to themselves, substituted one or other of the inferior imitations of our ventilator now in the market, and which are purposely "got up" to resemble as near as possible in external appearance the air-pump ventilator.

In the cases referred to the contractors were compelled by the architects of the buildings to remove the imitation ventilators, and replace them with the air-pump ventilator at their own cost. In one case—a workhouse—the contractor had to replace no less than forty 24-inch ventilators.

Under these circumstances, we consider it necessary to caution the profession against such an imposition, and to respectfully request that when our ventilator is specified it is clearly stated that "Boyle's Patent Air-Pump Ventilator" is to be used. If this is done we think the result would be advantageous to architects and their clients, and save after trouble and annoyance; at the same time, it would be conferring a great favour upon us by preventing our credit from suffering through worthless imitations being mistaken for the air-pump ventilator.

We are, yours truly,  
ROBERT BOYLE & SON.

64 Holborn Viaduct.

Ventilating Engineers.

## CHURCH BUILDING AND RESTORATION.

**Deane Church.**—This building, which is near Bolton-le-Moors, is about to be restored. A view of the roof was published last week. The roof is an interesting example of the work of the period when it was erected. The sunken traceried panels in the principals and the carving in the spandrels are particularly quaint, although somewhat rough in execution. The building is one of the few old churches remaining in the district with any architectural character, and is about to be restored under the direction of Mr. R. R. Knill Freeman, F.R.I.B.A., of Bolton. The contemplated works are a new oak roof, following in all respects the design of the old one, and re-using any of the beams which may be sufficiently sound; removal of the west gallery and organ, also of one bay at east end of side galleries; forming baptistery under tower, and opening out the arch between nave and tower; extension of the chancel, and other works.

## LEGAL.

High Court of Justice—Chancery Division, Feb. 18.

(Before VICE-CHANCELLOR BACON.)

TURNER v. SMALLPAGE.

LIGHT AND AIR CASE.

This was an action by Mr. James Smith Turner, a surgeon-dentist, in George Street, Hanover Square, and his landlord, against Messrs. Smallpage & Son, tailors, of Maddox Street, for, in substance, a mandatory injunction to compel the defendants to pull down a chimney-stack which they had erected in the rear of their premises, and which the plaintiff, Mr. Turner, alleged obstructed the access of light to his operating room to such an extent as seriously to interfere with his practice as a surgeon-dentist. It appeared that the defendants had, prior to the recent rebuilding of their premises, given Mr. Turner an undertaking not to raise their wall opposite to the room in question higher than it formerly stood, but it was now alleged that the defendants had broken this undertaking by erecting on their wall the chimney-stack complained of.

The Vice-Chancellor said he was satisfied upon the evidence that the plaintiff, Mr. Turner, would be unable to enjoy his house or carry on his business with the same comfort and advantage as before if the chimney-stack in question were allowed to remain, and he had not heard a single argument urged why the promise or undertaking given by the defendants not to raise their wall higher than it was before should not be kept. The plaintiff was right in relying on that promise, and, moreover, it appeared that the moment his alarm was aroused by the defendants proceeding to erect their chimney-stack, he remonstrated with them on the subject. His Lordship was satisfied the plaintiff had established his case. It had been said that the Court ought not to interfere by way of mandatory injunction, but there was no reason in the world why the Court should not in a proper case grant such an injunction. There must, therefore, be a mandatory injunction as asked, with costs, but the order was not to be enforced for a month.

## SCHOOL BUILDINGS.

**Birmingham.**—At the meeting of the School Board, the committee reported that Mr. Dixon, the chairman of the Board, had offered for the purpose of a technical school to place a large building in Bridge Street at the service of the Board for five years, rent free; to make all the necessary structural alterations, and to provide heating apparatus, &c., at his own cost, so that it would only remain for the School Board to provide the requisite furniture and to pay the teaching staff. The plans which the chairman had had prepared provided a laboratory, a lecture theatre, a room lighted by skylights for teaching drawing, and two class-rooms for instruction in the ordinary school subjects; besides a workshop, which would be fitted with carpenters' benches and lathes for teaching the use of tools. There would also be a dining-room for the use of boys who might stay on the premises during the dinner-hour, and a convenient lavatory, offices, &c.

**Delph.**—It is intended to erect a new school to accommodate about 400 scholars for the congregation of Delph, Saddleworth, adjoining the present chapel. Mr. A. Banks, Rochdale Road, Oldham, has been commissioned to prepare the necessary plans.

**Stoke Prior.**—The united district School Board for Stoke Prior propose to erect a new school, and purpose obtaining a site at Rashwood for the buildings. Mr. John Cotton, of Birmingham and Bromsgrove, has been selected as architect for the schools.

## ARCHÆOLOGY.

**Cup Marks on Rocks.**—Antiquaries and others in Shetland are manifesting considerable interest at the present time in the subject of "cup marks" found on the rocks in certain districts throughout the islands. Mr. Sands, who spent some time in St. Kilda, and has recently been residing in outlying districts in Shetland, has devoted a good deal of attention to the matter, upon which he writes:—"If the distribution of cup marks throughout all Shetland could be ascertained, it might be the means of throwing much light on the prehistoric ages, which are at present wrapt in darkness; but this would be a task impossible for one man to accomplish. Although the making of these marks must have been as great as the building of the pyramids, they are unobtrusive, and may escape the notice of a stranger who passes within a few yards of them. Their existence in a particular district is only known to those who have been brought up there. I trust gentlemen of antiquarian tastes will turn their attention to the subject, and collect information in their localities and report. That these cups were not designed merely for the secular purpose of holding or pounding limpets is evident to me, who have seen them on rocks two miles from the sea, and even on the sides of boulders. I believe that they are a gigantic relic of solar worship, and I have discovered

that the groups form mystic numbers. This is not apparent at a glance; but, on the contrary, it seems as if the designers had planned so that they might remain a mystery to all who had not received the key. The belief in magic numbers is still prevalent in the Hebrides, as well as in Foula, and probably in other parts of Shetland. Nine was a favourite number with the Norsemen, although I infer that the cup marks were made on the rocks or Shetland long before the Norse invasion, and in Foula nine knots are to this day tied upon the 'wresten thread' which is bound round a joint to cure a sprain. The orthodox number of feathers on the tirl of a mill is nine, and other examples could be given. Vestiges of sun worship are numerous in the customs of the inhabitants of Foula. Cups, although they are not confined to rocks suitable for fishing, are generally to be found there, and it may have been believed that they conferred a magical character on the bait. They prove that the same widespread and deep-rooted superstition existed in Shetland as in the Western Highlands and islands of Scotland, and, if thoroughly investigated, may prove a great deal more."

## ENGINEERING WORKS.

**American Bridges.**—The entire length of the great cantilever bridge over the Niagara, which has just been completed, is 910 feet, the distance between the towers being 470 feet. It is 239 feet high from the water to base of rail. Most of the material is steel. The bridge has been tested in the presence of 10,000 spectators. The test consisted in the running of twenty heavy locomotives and twenty-three cars laden with gravel upon the bridge, the entire series halting at every hundred feet, while the engineers made observations. The total load amounted to 1,900 tons. The bridge bore the trial well. It is a slender, graceful structure, erected at a cost of 750,000 dols. There has also just been completed a massive stone bridge over the Mississippi river at Minneapolis. The length of the structure is 2,100 feet. It crosses the river with twenty-three arches and sixteen spans of 80 feet each, the width being 28 feet. The cost of the bridge, which has been erected by the St. Paul, Minneapolis, and Manitoba Railway Company, is stated to be 990,000 dols.

## GENERAL.

**Mr. J. D. Linton** has been elected president of the Royal Institute of Painters in Water-Colours, and Mr. J. H. Mole, vice-president.

**Mr. A. Wells** read a paper on "The Rise and Development of Ornament" at a meeting of the architectural section of the Glasgow Philosophical Society on Monday last.

**The Annual Exhibition** of the Manchester Academy of Fine Arts was opened to the public on Wednesday.

**Mr. Boehm, R.A.**, is engaged on a bust in terra-cotta of Mr. Herbert Spencer.

**The Rev. St. J. Tyrwhitt** is delivering a series of four lectures in connection with the Gilchrist Trust, at Banbury, on "Art in its Historical Development."

**The Erection** of the Dunfermline Galleries has been postponed for the present.

**Mr. F. Mackison**, architect, of Stirling, died last week, and was buried on Monday. Among the public buildings designed by him were the Callander Hydropathic Establishment, the parish church, Callender, and several Board schools. Mr. Mackison was in his sixty-second year.

**Birmingham Architectural Association.**—An ordinary meeting of this Association was held at Queen's College on the 12th inst. under the presidency of Mr. J. Cotton. Messrs. W. Hawley Lloyd and W. Tadman Foulkes were elected honorary members, and one other gentleman was proposed for membership. A paper was read by Mr. J. Spencer Swann on "The Influences of Literature on Art." A discussion and a vote of thanks followed, in which Messrs. H. H. McConnal, V. Scruton, T. W. F. Newton, and Franklin Cross, hon. sec., joined.

**Perry & Co., Limited**, have during the past year derived a profit of 23.082% from the business of the Company. After the usual deductions for depreciation of plant, fixtures, &c., a dividend of 7 per cent. will be paid on March 1, making, with the interim dividend, a total of 10 per cent. on the ordinary shares.

**The Governors** of the Llanely Hospital advertised for plans for a new hospital in November last, to which about twenty-seven architects responded. They selected a few designs out of the number for reference, the referee being Mr. Salter, F.R.I.B.A., of Woburn Place. He placed the designs in the following order of merit:—(1) Mr. E. M. Bruce Vaughan, Cardiff; (2) Messrs. Wilson & Dyer, London and Swansea; (3) Messrs. James, Seward & Thomas, Cardiff. He recommended Mr. Bruce Vaughan to be employed as architect, and the committee, at their meeting on Monday last, gave him instructions to proceed with the work.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, FEBRUARY 23, 1884.

### COMPETITIONS OPEN.

**ABERDEEN.**—July 1.—The Testamentary Trustees of the late Mr. John Steill, of Edinburgh, hereby notify that they will Receive Models for a Colossal Statue of Wallace, in Bronze, with Basement of Granite Blocks, to be placed on the Mound in the North-West part of the Duthie Public Park, near the City of Aberdeen, in conformity with Instructions left by Mr. Steill, at a cost not exceeding £3,000. Intending Competitors, on Application, accompanied with a Remittance of 10s. 6d. to Mr. John Otto Macqueen, 10 Bridge Street, Aberdeen, will be supplied with Copies of Mr. Steill's Instructions, Conditions of the Competition, and Lithograph Plan of the Duthie Park, showing Sections of the Mound. The Author of the Accepted Model will be employed to Execute the Work; and the Author of that next in order of merit will Receive a Premium of £50.

**BLOEMFONTEIN.**—March 31.—The Government of the Free Orange State, South Africa, for a Premium of £100 for Design selected for New Presidency, and a Premium of £100 for Design selected for New Chamber of Deputies. The Consul of the Orange Free State, 17 Gracechurch Street, E.C.

**LEICESTER.**—March 1.—Designs are invited for a Block of Buildings proposed to be erected on the South Side of New Entrance to the Market Place. Premiums of £25 and £15. Mr. J. Gordon, C.E., Borough Surveyor, Town Hall, Leicester.

**LONDON.**—March 1.—The Commissioners of H.M. Works and Public Buildings are prepared to receive Designs for New Buildings proposed to be erected in Whitehall for the Admiralty and War Office. Mr. A. B. Mitford, Secretary, H. M. Office of Works, 12 Whitehall Place, London.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper, under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring-boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use. A horizontal boiler, 17 ft. 6 in. long, 15 H.P. gave the following results: Temperature on plates, 196 deg. ditto on covering 94 deg.; 1 ton of coal was saved per week, and although the fire was raked out every evening, 20 lb. of steam were in the boiler next morning. The following Testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 23, 1883.  
Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

## BELL'S ASBESTOS SASH-LINE CORD

Is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire-escapes.

**BELL'S ASBESTOS FUEL,**  
For gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S ASBESTOS PAINT,**  
For coating woodwork. This paint is absolutely fireproof. The following Testimonial refers to this Paint:—

"Glasgow Herald and Engineering Times" Office, Glasgow.  
Mr. JOHN BELL 14th Nov., 1883.

SIR,—As one of the means that helped to save the buildings extending from Buchanan Street to Michell Street from the recent great fire I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the "Engineering Times" case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of your Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood thrice coated with Irish Lime at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

To avoid spurious imitations, and to secure the receipt of genuine goods, all orders should be sent direct to the undermentioned addresses, and not through agents or factors.

ILLUSTRATED PRICED CATALOGUE FREE ON APPLICATION TO

**BELL'S ASBESTOS WORKS, SOUTHWARK, LONDON, S.E.**

Or the Branch Warehouses:—Victoria Buildings, Deansgate, Manchester; 11 & 13 St. Vincent Place, Glasgow; 21 Ritter Strasse, Berlin.

**BELL'S ASBESTOS.**

## BELL'S ASBESTOS AND INDIARUBBER WOVEN TAPE AND SHEETING.

For making every class of Steam and Water Joint. It can be bent by hand to the form required without puckering, and is especially useful in making joints of manholes and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 ft. from 1/4 in. to 3 in. wide, and any thickness from 1-10th in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears my Trade Mark, without which none is genuine. The following Testimonial refers to this material:—

Whitechapel Public Baths, June 8th, 1883.

Mr. JOHN BELL, 118 Southwark Street, S.E.  
DEAR SIR,—I used your Asbestos and Indiarubber Woven Sheeting for the bath-valves some six months ago, and in taking the tops off the other day to examine them, found them as perfect as the first day I fitted them, while the indiarubber ones put in the same time were completely cut through. I am about to put your sheeting on all the valves in this establishment, as I feel confident they will do far better than with indiarubber.

Yours truly, D. SHARP, Engineer.

It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10 ft. length of the Asbestos Tape purchased by them bears my Trade Mark.

## BELL'S ASBESTOS CEMENT.

For the backing of firegrates and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firegrates and kitchen-ranges of private houses.

## BELL'S ASBESTOS PUTTY,

For various kinds of steam and water joints.

## BELL'S PURE ASBESTOS CLOTH,

For chemical and other filtering. This cloth is specially manufactured for Maignen's unequalled water filters, for which a gold medal was awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

## BELL'S ASBESTOS BLOCK GAS FIRES.

The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas-burner, is fixed at the bottom of the block. After being lighted a short time both the block and asbestos fuel throw out intense heat.

## BELL'S Special LONDON-MADE ASBESTOS MILLBOARD,

For Dry Steam Joints, made of the best Asbestos fibre, is well known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimetres thick. Each sheet bears my Trade Mark.

## GLASS PAINTING AT THE ROYAL ACADEMY.

R. AITCHISON is certainly the right man in the right place when he is lecturing at the Royal Academy as the representative of those views which are becoming more and more popular with reference to the ancillary fine arts, their dignity and delight. It is more particularly with colour that he has occupied himself in his official capacity hitherto, as the outcome of a wide and liberal study of chromatic science in his private practice. But as there can be no doubt that he is equally competent to

deal with the other provinces of the whole empire of the "minor arts," we hope to find him in course of time taking up in a more systematic way one of these after another, upon which to discourse to the English art-world, at the headquarters of English art, in that peculiar spirit of piquant but solid and thoughtful enthusiasm which becomes him so well, and which has always given so much honest force to his sentiments.

We must bear in mind what the lectures at the Royal Academy are meant for. They are supposed to be the discourses of certain professors in an educational institution, whereby the students, by the help of rhetoric, are to be instructed by men of the very highest intellectual status in the mystery or mastery of the work to which they are devoting their lives. Actual practice under the direction of a teacher, in the *atelier*, or studio, or work-room however designated, is to be the means for their acquiring the handicraft; but an occasional exposition of the philosophy of the matter from the lips of a professed scholar is superadded, for the purpose of enabling them to grasp the greater principles of their subject, and to take into view the collateral prospects of knowledge, so that their particular skill may be anchored upon a groundwork of science, as well as supported by enlarged information.

As regards architecture, however, it has always been manifestly impossible for the titular "professor" of that art to do more than discourse as pleasantly as he could, in the form of four lectures in the year, upon some stately but superficial view of such architectural questions, more or less popular in their character, as he might be best able or most willing to venture upon, having regard to such considerations as the passing condition of the professional world, his own credit, and the nature of his audience. His audience, be it remembered, is formed of the whole body of the students of the Royal Academy, in painting, sculpture, and architecture indiscriminately, a good many absentees deducted, and sometimes a very few strangers added. Thus the lectures of Professor COCKERELL, now an old story, were the elegant gossips of a refined *dilettante* upon whatever subject of an eclectic character might come uppermost; those of SMIRKE were a heavier effort on the same lines; and those of EDWARD BARRY were still the same, if on a lower level; while SCOTT and STREET were actuated more by the partisan desire to substitute Gothic for Eclectic taste all round, and to force upon public attention a transitory passion which they fondly mistook for the one eternal basis of all art. Since Mr. STREET's death the business has got into a little confusion; and this year the short service of discourses has been placed chiefly in the hands of an amateur Egyptologist, Mr. AITCHISON coming after him with what he has to say upon the subject of glass painting. There is a real grievance here, no doubt, for those who are accustomed to complain of the treatment which the Queen of the Arts receives from the dominant painters of Burlington House; but for our own part we prefer to think that if Mr. AITCHISON, and perhaps others, were to be allowed for a few years to bestow upon the arts of decoration and ornament that fair share of academical attention which they have never yet received from any prominent artistic authority in this country, the public interest might be all the better served. At the same time we are quite of opinion that there is genuine force in the question why it is that Messrs. NORMAN SHAW, PEARSON, and WATERHOUSE, and indeed Mr. BODLEY also, should all be so very dumb. The duty of the Royal Academy towards the fine art of architecture is surely not

wholly fulfilled by the selection from amongst the successful designers of the day of half a dozen of the best, to have a distinctive, perhaps an invidious, handle attached to their names; some one at least of the fortunate number ought to be able to give a reason on the very highest ground for the faith that is in him; but of this we say no more.

Mr. AITCHISON, in giving a reason for the faith that is undoubtedly in him, draws a bold distinction between the "painters" who are so very well known and the "glaziers" who are not so well known, but whom he seems to regard as their superiors rather than otherwise. Coloured glass workers, that is to say, are with Mr. AITCHISON "glaziers," and the designation, if in common parlance otherwise appropriated, is at least in these days suggestive of the great fact that it is the man and his work, and not the name and pretension, that are to be honoured. The men by whose artistic device, artistic drawing, and artistic handiwork there are produced, in the luminous vehicle of coloured glass, such wondrous examples as we see at times of the felicitous conventional pictures and chromatic harmonies proper to the material, are not only artists, says he, as others are, but artists whose field of art is especially glorious. Their work is not the mere toy-work which so many people take it for—toy-work which the lecturer, in his own quaint way, contemplated for a single moment in the very low form of "the plaster church with a lantern inside"—it is the work of the "painter" glorified by his taking the bright effulgencies of heaven upon his palette instead of the dull chemical earths of the shops. The "glazier," therefore, if he be as worthy of the name of an artist as he sometimes may be, becomes a great artist instead of an artisan, and such an artist, perhaps Mr. AITCHISON would like to say, as we may hope one day to see occupying a seat, and indeed an honourable one, amongst the forty. Why do not our painters try their hand at glazier's work? he asked boldly; indeed he applied *argumentum ad hominem* still more boldly, and inquired if Sir FREDERICK LEIGHTON himself, sitting grandly in the chair before him, might not do his art more credit than some would expect if he were to rise to the occasion—to ascend rather than descend—and make an effort in the delightful work of the "glazier." For "the painter," said Mr. AITCHISON, amidst the genuine applause of his audience, "ought to be above all other things a colourist," and here is colour for him in its absolute perfection. Enthusiasm such as this is, in our opinion, by no means out of place. There is no lack of quaint enthusiasm in our day and generation; but this is something altogether better and more true to nature; and, if we do not mistake the tendency of cultured opinion, it is what is destined to be more and more accepted by the English intelligence as safe and sound criticism. The time is gone by for the obsolete formulæ of the Renaissance academies to exclude from scholarly rank all other arts but the three to which a MICHAEL ANGELO applied his powers on the elevated level of his Moses, his Sistine Chapel, and his Basilica of St. Peter; spurious exclusiveness of this order not only does more harm than good at any time, but does the utmost harm and no good at all amidst our modern associations now; and everyone may welcome, we are sure, without fear of its effect, the growth of opinion in the liberal direction of the widest comprehensiveness of artistic recognition.

It was to be observed that the body of students who chiefly occupied the theatre cheered Mr. AITCHISON with especial heartiness when he alluded to the particularly successful work of Mr. BURNE JONES at Oxford, as an instance in which the genius of a "painter"—perhaps in his heart he meant a somewhat wayward manifestation of genius, if measured by more ordinary standards—had found the fittest subject for its exercise in this exquisite work of the "glazier," committed to him under exceptionally favourable conditions. We do not attach much importance to the admiration of youth for eccentricity, but we read the echo of approval from Mr. AITCHISON's students on this occasion as an expression of a more wholesome sentiment. To be a painter specially adapted by natural idiosyncrasy for the peculiar conventionalism of the colour-glass picture, is what may be called an accident of a particularly happy character; and we can very well understand, if it ought to be so understood, that the *forte* of Mr. BURNE JONES might prove to be colour-glass work exclusively, if he could be persuaded to pursue it with the exclusive earnestness which Mr. AITCHISON considers to be worthy of the subject. Again we cannot help saying that enthusiasm such as is here brought into notice is, in our opinion, true art criticism.

In the old mediæval glass which, in so many instances, appears to be beyond all hope of emulation exquisite in both the melody and the harmony of its colour, it is very honestly pointed out by Mr. ARCHISON, amongst other things, that "dirt and decay" may take credit for a good deal of the charming effect. It is unfortunately the case in many other kinds of art besides glass pictures, that a certain obscurity produced by atmospheric corrosion and deterioration is not only accepted by connoisseurs as a beneficial "toning down" of the work, but is admitted by the most fastidiously graceful taste to be an unquestionable improvement. Mellowness takes the place of rawness, and this is the work of time. The same mellowness may be produced by artifice, but the result is an artificiality of tone which is unwelcome. It is not easy to account for this logically, however manifest it may be experimentally, and we may be content to think it cannot be helped.

Much more might of course be said upon the details of Mr. ARCHISON's pleasing lecture, but we can at present only once more congratulate the Royal Academy upon having acquired in the person of the latest Associate so true a representative of sound popular opinion upon the somewhat neglected arts of decoration.

## THE SURVEYOR'S MIND.

[BY A CORRESPONDENT.]

THE paper which was read by Mr. RICKMAN at the Surveyors' Institute (see *The Architect*, February 2) is, apart from its professional value, interesting, as it shows rather impressively how great an influence certain intellectual pursuits can exercise upon modes of thinking. Any one who is in the habit of noting mental phenomena must have observed that building surveyors, even in their ordinary conversation, are analytical, and that almost mechanically the simplest subjects are divided and sub-divided by them in a curious way. Mr. RICKMAN's paper is so thoroughly analytical that to find a parallel to it outside his profession it would be necessary to have recourse to dialectic essays. In his case it would seem that analysis is not altogether an acquired power. If we take as evidence the dissertation called an "Attempt to Discriminate the Styles of English Architecture," which was drawn up by Mr. RICKMAN's father in 1812, it is reasonable to conclude that the power was inherited. That famous essay is probably the most remarkable example of analysis in the language; for at the time when it was produced a Gothic building appeared to most men to be nothing more than a chaos of masonry. RICKMAN was able to classify the parts, and the four divisions employed by him to distinguish all varieties of English Gothic are never likely to be superseded. In its original form it occupied about forty pages, but there is a greater amount of information upon architecture in that limited space than in volumes which contain five times the quantity of printed matter. Look, for example, at the table in which some of the principal parts of Greek and English buildings are contrasted. Although it is well known to architects and to every one who has an amateur's interest in architecture, it is worth reprinting here in connection with this article, if it were only as an example of the logical conclusions which can be deduced as a result of a series of observations.

### Grecian.

The general running lines are horizontal.  
Arches not necessary.

An entablature absolutely necessary, consisting always of two, and mostly of three distinct parts, having a close relation to, and its character and ornaments determined by the columns.

The columns can support nothing but an entablature, and no arch can spring directly from a column.

A flat column may be called a pilaster, which can be used as a column.

### English.

The general running lines are perpendicular.

Arches a really fundamental principle, and no pure English building or ornament can be composed without them.

No such thing as an entablature composed of parts, and what is called a cornice, bears no real relation to the shafts which may be in the same building.

The shafts can only support an arched moulding, and in no case a horizontal line.

Nothing analogous to a pilaster; every flat ornamented projecting surface is either a series of panels or a buttress.

### Grecian.

The arch must spring from a horizontal line.

Columns the supporters of the entablature.

No projections like buttresses, and all projections stopped by horizontal lines.

Arrangement of pediment fixed.

Openings limited by the proportions of the column.

Regularity of composition on each side of a centre necessary.

Cannot form good steeples, because they must resemble unconnected buildings piled on each other.

### English.

No horizontal line necessary, and never any but the small cap of a shaft.

Shaft bears nothing, and is only ornamental, and the round pier still a pier.

Buttresses essential parts, and stop all horizontal lines.

Pediment only an ornamented end wall, and may be of almost any pitch.

Openings almost unlimited.

Regularity of composition seldom found, and variety of ornament universal.

From its perpendicular lines, may be carried to any practicable height, with almost increasing beauty.

To appreciate the labour that was requisite to produce the foregoing summary, at a time when the study of architecture was neglected, the reader need only make the attempt of adding other characteristics to it. Professor WILLIS did so, and found it no easy task. For every one of the statements represents in the first place a vast number of single observations, and, in the second place, insight and judgment are needed to give as it were the essence of the facts. That the latter part of the process may be attended by uncertainty is evident from the erroneous conclusion that a Gothic shaft sustains no weight, and is merely an ornamental appendage. THOMAS RICKMAN's analytical skill is apparent in almost every line of his "Attempt," that is, if the earlier editions are consulted; in the later editions his remarks are almost lost amidst the comments of other writers. In respect of that capacity, there is a family likeness between the "Attempt" and the paper on "Building Risks and their Incidence," although they are separated by an interval of over seventy years. Everything that appears to be compound is resolved as far as practicable into something simpler. The paper starts by dividing risks into two classes—those of builders and of employers. Then each class is again divided, and so on throughout to the end. The ultimate effort of analysis is to resolve many things under two heads, and Mr. GLADSTONE's famous three courses can sometimes be thus exemplified. Mr. RICKMAN has a fondness for this duality, but his classifications are not so apparent in the newspaper report as they were in the original manuscript.

Our object is not, however, the consideration of Mr. RICKMAN's excellent paper in its details. We have referred to it because it is in its way as characteristic a product of a surveyor's mind as the most elaborate bill of quantities. What most concerns us is the process exemplified. Now we have no hesitation in saying that analysis, although most useful in its way, is, like most other good things, accompanied by drawbacks. One of these is a weakening of the creative power. A man may possess great skill in analysis, and in some mysterious way be unable to construct the things which he knows in their elements. There is a remarkable example found in the history of the genius who brought logical analysis almost to perfection. In ARISTOTLE's "Poetics" we seem to have the whole secret of all kinds of poetry made as plain to the understanding as the items in a surveyor's "bill," but it does not appear that the philosopher was able to compose a lyric. The law which operated in the case of the Greek philosopher is still in force. When attention is given to dissection, there is an end to creation. To recur again to the example of RICKMAN, we see the man whose knowledge of Gothic details was so remarkable producing buildings to which no student would have recourse for inspiration. And the reason is not obscure. The analytical mind is prone to consider parts by themselves, without giving any thought to the relation between them. A building surveyor is indifferent to the appearance of the building with which he is connected, and one might go so far as to say that in many cases quantities are taken out without any effort being made to realise the form of the building as a whole. If there is a perspective it can hardly escape notice, but in its absence a substitute will rarely be constructed in the surveyor's imagination. The incompatibility between the surveyor's process and that of a designer is an every-day experience. In country towns it is not uncommon to find architects employing surveyors to take out quantities, although they themselves are

competent to undertake the work, and are not well able to afford the expense of an extra assistant. But they feel that a week or two in quantity-taking unfits the mind for the work which should be more worthy of an architect's attention. Mr. RICKMAN in his paper acknowledges this, when he says that "the business of a measuring-surveyor is a branch of architecture not conveniently carried on by the same person who is engaged in designing," and he might have added that the difficulty does not arise altogether from inconvenience, using that word in the ordinary sense, but from something that is inherent in the human mind.

At the present time it would be an advantage if the difference between their capabilities could be realised by surveyors and architects, and, what is no less important, by the public. If it were, it would prevent encroachment among the former, and it would enable clients to be more discriminative in the bestowal of commissions. The necessity of skilled supervision is generally recognised; but it is also supposed that the so-called "practical men" are best fitted for the office, and, owing to the influence of a common fallacy, surveyors are accepted as their representatives. In Government departments there is a belief that surveyors are excelled by officers of Royal Engineers.

### MESSRS. J. TYLOR AND SONS.

VISITORS to the metropolis, as they journey from Holborn to Cheapside, can hardly fail to observe the lofty tower which rises far above the buildings between Newgate Street and Paternoster Row, and which in height, if not in size, competes with St. Paul's as a landmark. It is often supposed, and even by Londoners, to belong to the neighbouring prison, and to be a ventilating shaft or an observatory. But the tower has been erected by Messrs. TYLOR & SONS, and is a part of their premises. To any one who is acquainted with the character of the work produced by the firm, its existence is suggestive. The tower is simply a colossal testing apparatus. It was considered necessary that sluice valves, stop-cocks, pipes, and other things, should be subjected to an enormous water pressure, and accordingly means were adopted by which one of 600 feet can be applied. Hence the tower arose. The aim of Messrs. TYLOR & SONS is to produce goods which can be trusted as corresponding with their descriptions, and to insure that end, time, skill and money are expended liberally. Their water-tower is like many expensive machines, which may be seen in the workshops, and forms part of a system that governs the production of the smallest taps and plugs, and gives them a special character.

Messrs. TYLOR & SONS are sometimes described as "engineers and brass-founders," but they are essentially hydraulic engineers. Almost everything produced in the Newgate Street works comes in contact with water when in use. Pumps, fountains, syringes, waste preventors, garden engines, hydraulic rams, baths, stand pipes, hose, meters, traps, basins, closets, cisterns, boilers, lavatories, urinals, flushing apparatus are among the objects made by the firm, and they are all intended to have water flow through them. Let a supply exist, and there is nothing connected with the distribution of water, either within or without a house, which cannot be supplied and made by Messrs. TYLOR & SONS. From their own stock they can furnish the sluice valves which open and close the mains, the meters which register the quantity of water that leaves the reservoirs, and the tools which are needed for the repairs of all pipes. In the comprehensive establishment in Newgate Street, everything that can be called hydraulic seems to be available, from a steam-engine for pumping machinery to a cock for a kitchen boiler, from a spray bath to a washer, from a ship's fire-engine to a tap wrench. A professor might with advantage use the general catalogue of the firm as a text-book to explain the latest developments of practical hydraulic and sanitary engineering. It is only in our time, and in England, that such a business could exist. Elsewhere drainage and water supply are more simple affairs.

There is nothing about the exterior of Messrs. TYLOR'S premises which indicates the variety or the importance of what is to be seen inside, and the frontage is small in comparison with the area of the works. On entering, one sees that there is no attempt at display. The long passage is flanked by pumps of all descriptions. Then a hall is reached, which is filled with examples of sanitary appliances. Other depart-

ments and workshops are further on. The lighting is good, and everything can be seen clearly, but it would need a volume to describe the specialities. Messrs. TYLOR'S catalogue of 1879 contains about five hundred pages, and one which is in preparation will be still larger. All that can be done here is to suggest the importance of the department in which our readers are most concerned—that relating to house drainage and sanitation—and leave the reader to examine the objects with his own eyes.

The water-closets may be allowed the first place, from their sanitary importance. They range from the simple hopper to elaborate seat-action and door-action closets. In the "Side Outlet Regulator Valve Closet" the outlet-valve can act as an overflow escape, and retain sufficient water to be sealed. If the water-flush should fail, there is a self-acting arrangement which closes the overflow passage against sewer gas. Another regulator valve closet, known as the Rogers Field Pattern, is made, without an overflow, and the patent parallel motion allows the handle to be drawn in a direction that is nearer the perpendicular than is possible with the common arrangements. Some of the closets are made in such a way that the trap need not be under the level of the floor. They are consequently available for rooms with cement or other fireproof floors, as they may be fixed without entailing much damage to the floor. The basins are generally made with Messrs. TYLOR'S patent flushing rim, which is a great improvement on the fan and most other inlets.

One appliance, which is generally applicable to closets, is Messrs. TYLOR & SON'S Patent Waste-not Regulator Closet Apparatus. As the name implies, it has been devised in order to prevent an useless waste of water. If the handle of a closet is propped up not more than the prescribed quantity of water can pass through the basin. The firm have, it may be said, patented a great many waste preventors, which have been adopted by London and other water companies. In fact Messrs. TYLOR & SONS have a great advantage over their rivals from the character of their business, which, although so various in its application, has a principle in common. If an improvement is introduced in closets it may be found applicable to lavatories and baths, and *vice versa*. The details of all the appliances in consequence come under the observation of a great many experts in various departments, and endless opportunities are given for the attainment of perfection in working. In this way a scientific precision has been gained that is remarkable.

The baths are deserving of attention both on account of the material employed and of the arrangements for the inlet and outlet of the water. The iron of which the baths are made is first tinned and then galvanised, and it is claimed that this process produces more durable baths than those made of ordinary galvanised iron. Although strong, the baths are not of excessive weight. One kind, which may be termed the non-fixture bath, is of much importance to tenants who may have to remove. The pipes are so arranged that a return of soiled water into the bath is an impossibility; and, by means of the patent lock-waste apparatus, the waste-valve cannot be opened whilst either of the inlet-taps are running, nor either of the inlet-taps be opened until the waste-valve is closed. Among the specialities which Messrs. TYLOR have introduced for their baths, the following may be mentioned:—The quick waste-valve, by which the water is quickly discharged, and there is no risk of choking-up; the apparatus for combined shower and douche; and the patent boiler, which is easily fixed, and affords a supply for a bath in a room below the level of the cistern. The entire arrangements are so perfect that the luxury of bathing becomes enhanced by means of them.

It has been often remarked in international exhibitions that, while ornamental brasswork, whether on a large scale or for cabinet work, is produced in excellent style by foreigners, the humble but more useful plumbers' foundry work is far inferior to the English. The cases in Messrs. TYLOR'S showroom contain gun-metal, yellow metal, and silvered cocks of all sizes and varieties, which would hold their own in any competition. Some are made to resist extreme pressure, and among the improvements introduced is a patent grooved joint, by which junctions or attachments with a pipe can be made without soldering, and by a common labourer. The purchaser knows exactly what he may expect in using one of those cocks, and no attempt is made to confer imaginary qualities upon them. The prices charged are most reasonable, considering the quality

of the work, and that the taps are finished by men instead of by girls. By making plumbers' brass-foundry a part of their business, Messrs. TYLOR are enabled to introduce valves and taps for their baths, closets, and lavatory basins, in greater variety and having more efficiency than if they were dependent on a supply from provincial manufactories.

It is satisfactory to learn that the demand is increasing for work like that which is produced by Messrs. TYLOR, for their appliances can hardly coexist with scamped brickwork and carpentry. Unfortunately there is a tendency at the present time among many people to make cheapness the paramount consideration in arranging for builder's work. In consequence we have in the markets plenty of so-called sanitary appliances which from their price become attractive to all who are indifferent to the importance of good materials and workmanship. So long as people are willing, for the sake of a spurious economy, to employ those things, and live amidst discomfort and danger, they will be made. The jerry-builders and the selfish speculators in showy but flimsy houses can always find accommodating manufacturers who will supply, and on reasonable terms, appliances that present at first all the outward appearance of being useful. But it is needless to say that men of that class do not patronise such houses as Messrs. TYLOR'S, and they would seek in vain through No. 2 Newgate Street for closets, baths, or traps that would meet their sordid requirements. It becomes, therefore, a sort of indication of the value of a building when one can recognise the productions of Messrs. TYLOR among the fittings. The value of their work has been tested during many a year, and it may be accepted as indubitable that their sanitary appliances confer the security which is necessary in every house that claims to be healthy.

#### PARIS NOTES.

THE Museum of Decorative Art at the Palais de l'Industrie reopens to-day, March 1. Amongst the features of interest added since last year is an important collection of the works of M. P. V. Galland, and another of original cartoon sketches by M. Lechevallier-Chevignard, both of which are valuable contributions to the study of art as applied to modern decoration. One new room contains several classes of embroideries and other textile fabrics, and another is devoted to Oriental porcelain, ivories, bronzes, and lacquer work, from the collections of MM. Antonin Proust, P. Burty, Bigot, Dillon, Froudin, and Count Kleczkowski.

The Salon Committee is now busy preparing for the coming exhibition, which will open as usual on May 1. Paintings and drawings must be sent in to the jury between March 5 and 15, sculptures and medals between March 21 and April 15, and architecture, engraving, and lithography between April 2 and 5.

The French artists, MM. Detaille, de Neuville, de Vuillefroy, Dubufe, Gervex, Lansyer, and Alfred Stevens, have consented to form part of the Fine Arts Jury at the International Exhibition to be held in the Crystal Palace.

M. Benjamin Ulmann, Grand Prize of Rome and Knight of the Legion of Honour, is recently deceased. M. Ulmann, who was well known as a painter of classical subjects, was an Alsatian by birth, having been born at Blotzheim in May 1829. One of his chief works is *Sylla and Marius*, which was bought for the State, and is now in the Luxembourg Gallery. The mural paintings in many of the public buildings in Paris, and notably those in the great hall of the Conseil d'Etat, are reckoned amongst his finest efforts. One of his drawings, *Cato in the Senate*, was reproduced in *The Architect*.

It has been decided to establish a lift between the ground-floor of the Palais de l'Industrie, where the sculpture exhibits of the Salon are placed, and the first-floor picture galleries, so as to afford easy access from one section to another for the infirm and paralysed, who have hitherto been prevented from enjoying the annual exhibitions owing to the difficulty of climbing the stairs. Such at least is the reason given by the Paris papers in announcing the improvement.

A first portion of the Castellani collection of pictures and antiquities is announced for sale at Rome on March 17, and the bidding is expected to occupy at least a month. According to the *Rappel*, Mr. C. T. Newton, C.B., of the Greek and Roman Antiquities Department at the British Museum, and two conservators of the German State Museums at Berlin, have been sent to Rome by their respective Governments to make purchases. France will not be represented, in consequence of the inadequate credit voted for such acquisitions (only 150,000 frs. for the eight departments at the Louvre). The remainder of the collection will be disposed of in Paris during the month of May.

In view of the small amount voted annually for the Caisse des Musées, a petition is being numerously signed in favour of establishing one paying day per week in all the State museums—the whole receipts to be devoted to the acquisition of new treasures.

On the suggestion of M. Kaempfen, Director of Fine Arts, the Minister of Public Instruction has decided upon the appointment of a special Committee of Works of Art (*Comité des travaux d'art*), whose duties it will be to examine the designs or models sent in for the decoration of public buildings, to choose the works to be acquired by the State in each year's Salon, to classify copies of celebrated pictures, and to examine the works of artists who have gained a Prix de Salon or a travelling scholarship.

We are glad to learn that M. Hébert, the well-known painter, who had been in very delicate health for many months, has just returned from Nice completely restored, and was present at the last meeting of the Academy of Fine Arts.

M. Christophle, Governor of the Crédit Foncier, has been called to give evidence before the Commission of Inquiry into the industrial crisis. He stated that in the building trades of Paris there are about 25,000 contractors, including the small employers of labour. Many of these combined, but often with inadequate capital, and they then borrowed money to carry on their operations. M. Christophle denied that six or seven milliards of francs had been laid out in Paris on new buildings within the past six or seven years, and estimated the real sum expended at 1,200,000,000 or 1,300,000,000 frs. (48 or 52 millions sterling). The advances from the Crédit Foncier had increased in amount only since 1880, when they totalled 40,000,000 frs., as compared with 151,000,000 frs. in the following year. Four-fifths of the new tenements were occupied, and he urged that any discouragement of building operations at the present moment would merely aggravate the crisis.

The decision of the Court in the Trouillebert-Fedesco case (referred to in *The Architect* of last week) was delivered on Saturday last by the Judge-Substitute, M. Rouillier. In giving judgment, he clearly defined the distinction existing between that part of the copyright of a book or work of art which is sold by the author for the use and benefit of the publisher or dealer, and that other part which remained the property of the former in despite of the sale. This was adjudged to be the title of the work itself and the reputation, whatever it may be, attaching to same. On these grounds the decision was necessarily in favour of M. Trouillebert on all points.

The candidates for the seat left vacant in the Académie des Beaux-Arts, by the decease of M. Lesueur, have been classed in order as follows by the architectural section of that body:—MM. Diet, Daumet, André, Normand, Magne, and Renard. The first-named will probably be elected.

#### POISONOUS PIGMENTS AND WALL-PAPERS.

ABOUT a year ago the National Health Society solicited Earl Granville to instruct the representatives of the Foreign Office abroad so that they might obtain reports respecting foreign enactments for the limitations, restrictions, or safeguards in the manufacture, use, and sale of arsenical and other poisonous colours used for wall-papers and other decorative purposes. A circular was accordingly addressed to the representatives by His Lordship. The reports which were received have been printed, and will be found interesting to sanitarians. The following abstract will suggest the state of opinion on so important a subject:—In Austria

there is no direct prohibition against the production of arsenical and other poisonous pigments; but the manufacturers require a license and special permission for the establishment of such a business, and precautionary measures have to be adopted by them for the protection of the workmen. The Austrian authorities are considering certain proposed stipulations by which the employment of colours made of arsenical substances will not be allowed in artificial flowers, wall-papers, coloured paper, and dressing stuffs, and the importing of all articles in which arsenical pigments are used is to be illegal. An Imperial law was passed in Germany in 1879 in order to regulate the sale of all articles containing poisons, but there has been more or less uncertainty about the interpretation of some of the enactments. A committee of the Reichstag have recommended that the words "prepared with arsenic" should be used instead of the words "containing arsenic," as by this means colours only to which arsenic had been added would be forbidden, whereas others containing very slight blendings of arsenic through accidental circumstances, such as earth colours, would be permitted. In the decree of the Emperor which came into force, it is accordingly ordained that the use of "colours prepared with arsenic" is forbidden in the manufacture of paper-hangings. The punishment for contravention is severe, and, in case of severe bodily injury or death to a human being, it may extend to five years' penal servitude. The Imperial law in no way interferes with the regulations which have been adopted in the several states. In Baden not only are arsenical wall-papers illegal, but there is a prohibition against the tinting of walls or ceilings of dwelling-houses or factories with arsenical compounds. The Hessian police code imposes a penalty of from one to thirty florins on any person who, for the purpose of furnishing or covering the walls of any dwelling-room employs paints, wall-papers, or stuffs tinted with any of the pigments which are designated as "injurious to health" such as Scheel's green, Schwemfurt green, and King's or Naples yellow, and all colours containing arsenic, or combinations of arsenic. The use of these colours for tinting furniture is likewise prohibited. Regulations against arsenic and other dangerous paints have been in force in Saxony for many years. In 1856 the people were warned against a red pigment known as Munich red, cochineal red, and Pernambuco lake (Brazil red), and used for paper-hangings, coloured paper, and for staining. Again in 1868 a warning was issued against window-blinds coloured with various arsenicated pigments, which, being applied in a very superficial manner, were easily detached from the blinds as powder, so that the air became impregnated with poisonous molecules. According to the Saxon authorities, poisonous colours are prejudicial to health when not properly applied to the surface of the papers, or when not smoothed down or not varnished; or if the hangings are applied to damp walls to which they do not hold firmly, so that the pigment is liable to flake or dust off. But those colours are innocuous when applied to the walls of rooms if the walls are and remain dry; if the wall is dry before the painting, and the lime used is mixed with milk not over-diluted, or the colour when dry is washed with a suitable fluid, such as water-glass, &c. Colours of this class, especially the more injurious, viz., the greens and blues, should be altogether excluded from sleeping apartments, as well as from workrooms in which the air is highly saturated with aqueous vapour, or impregnated with the fumes of vinegar, ammonia, chlorine, sulphuric acid, &c.

Poisonous colours when used in carpets or wall-papers are attended by exceptional risk in Sweden, as the inhabitants live during winter in apartments which are almost hermetically sealed. A statute was issued by the King in 1876, which prohibits the manufacture and importation of arsenious acid or white arsenic in Sweden unless the royal permission has been obtained. Wall-paper, window-blinds, Venetian blinds, tissues, artificial flowers, or other articles in water-colour, printed or painted in colours containing arsenic, are not to be kept or offered for sale. An elaborate list of poisonous colours has been prepared by the Swedish Board of Health, but the term "poisonous" does not seem to have a strict definition. Thus, for example, we find among the white colours considered to be obnoxious, bismuth white and zinc white, while a note states, "These colours when used as paints are perfectly harmless. Bismuth, even when followed in large doses, is inert, and the substitution of zinc whites, albibissima, Charlton white, silicate paints, &c., for white lead is much to be desired." It is also said that arsenic has been discovered in other colours besides the green-copper colours, such as some of the most beautiful of the red-drop colours, various grey colours used in printing wall-papers, and in tar colours. According to the law of Denmark, arsenical preparations may not be used for staining, dyeing, or colouring stuffs, window-blinds, Venetian blinds, artificial flowers, lamp-shades, paper, &c., nor form part of a pigment mixed with glue, gum, size, dextrin, white of egg, &c., for walls of rooms or wall-papers.

The Russian code of laws prohibits the importation as well as the manufacture in Russia of all wall-papers which are covered with a thick coating of arsenical colouring matter, both opaque and glazed. There is an exception in favour of paper in which the pattern is traced in arsenical paint on a more extensive ground of non-arsenical colouring matter. Lists of injurious colours and harmless colours have been prepared, and the following plain

method for detecting the presence of arsenic in articles coloured or dyed has been issued:—

For the purpose of testing green and other wall-paper, in which the presence of arsenic is suspected, a small piece of such paper should be taken and cut into shreds, which are then to be placed in a wine-glass. If the object of examination be colouring matter, a piece of the size of a pea should be taken and treated in the same manner; if a piece of tissue is, under examination, a small shred of it should be cut off. The piece of paper, dye-stuff, or tissue must be treated with caustic alkali (solution of ammonia), a teaspoonful of which must be poured over the object of examination. The liquid will assume a blue colour, and, after five or ten minutes, half a teaspoonful of pure hydrochloric acid (chemically pure), which will give the liquid a light green hue, must also be poured into the glass. Finally, a piece of copper, or a copper coin, previously polished with sand, is placed in the green liquid. If after the expiration of five minutes the copper shows on its surface a grey, glistening deposit, then the wall-paper, dye-stuff, or tissue contains arsenic; but if the surface of the copper remains red, there is probably no arsenic present. It must, in addition to this, be observed that all articles coloured with arsenical paints emit, when burnt, a smell of garlic.

While so many countries have adopted measures to protect the inhabitants against poisonous colours, there are others which are as indifferent as England. France has no regulations except in the case of articles of food, beyond a circular which has been issued by the Minister of Commerce cautioning manufacturers, and explaining the responsibility they would incur in the event of accidents arising from the use of poisons. Belgium is also without a decree to restrict or regulate the manufacture, use, or sale of arsenical or other poisonous pigments employed in industry or in the decorative arts. The same may be said of Greece, Italy, Holland, Portugal, Spain, and Switzerland. There is no federal law on the subject in the United States, and it may also be asserted that there is no State legislation or municipal enactment bearing on the matter.

## THE LOCAL GOVERNMENT OF THE METROPOLIS AND STREET ARCHITECTURE.\*

(Continued from page 126.)

LET us now consider the works of that younger body—the Metropolitan Board of Works—so far as they have relation to the subject the consideration of which has called us here this evening. Although in existence as a corporate body only twenty-eight years, it must be admitted that the amount of work achieved by them in the way of street improvements and otherwise is immense. Setting aside for a moment the main drainage of the metropolis, the embankment of the Thames north and south, the formation of public parks, the freeing of the metropolitan toll bridges, and the securing beyond the reach of rapacious owners and the ever-advancing speculative builder such open spaces as Hampstead Heath and Clapham Common, the facilitating of traffic from one part of the metropolis to the other by the formation of new streets, and the widening of existing thoroughfares, has received very considerable attention at their hands. Many of these street improvements are of first-class importance. I have only to name the following to insure your being in accord with me in this view—Garrick Street, Southwark Street, Queen Victoria Street, Northumberland Avenue, the new street ultimately destined to become the leading thoroughfare from the east to the west of London, commencing at Bethnal Green, at present carried as far west as the corner of Hart Street, Bloomsbury, and soon to be followed by a continuation to Piccadilly Circus. Nor must we overlook such minor improvements as the removal of Middle Row, Holborn; the widening of Tooley Street, High Street, Wapping; Kentish Town Road, High Street, Kensington; and that much-needed improvement the widening of Gray's Inn Road, involving as it did in its execution the removal of the wretched courts, alleys, and slums which had only too long been a plague spot and disfigured the map of London in its very centre.

In a busy commercial centre like London the truth of the saying "time is money" is proved more conclusively than in places where commercial activity is less pronounced, and there can be no more sure means of economising time than in reducing the distances which have to be traversed in proceeding from one part of town to another, and insuring that the thoroughfares over which we have to pass are free from obstruction. Little can be said in adverse criticism of the street improvements I have named, either in regard to their direction, width, and improved gradients, their general conception and laying out; and the Metropolitan Board of Works have earned the thanks of Londoners generally by doing so much to relieve the congested state of the street traffic. It is only when the improved street surfaces have been formed and the cleared land is covered with new buildings, that we notice what may be termed errors of omission—omission to insure that the

\* A Paper by Mr. L. H. Isaacs, read at a meeting of the Architectural Association.

new buildings shall be worthy of the sites on which they are to be located—sites, be it remembered, which have been acquired at an enormous cost to the ratepayers. To all who are acquainted with London, and have watched the growth and completion of the street improvements effected within the last quarter of a century, this omission to exercise proper control over the designs of the new buildings will have been noted only too frequently. I may be told that it is desirable at the earliest possible moment to obtain a recoupment of the money, or some portion of the money, expended in the formation of the new thoroughfares, and with that object to let or sell the cleared land as quickly as possible. Yet granting all this, it must surely be admitted that the land should not be parted with, and all control over it given up, until some security was obtained that the sites would be adequately covered, and that we should be spared the pain of looking at buildings which, so far from deserving to be located in first-class thoroughfares, are scarcely good enough to be relegated to a third or fourth-class street. I have only thought it necessary to produce to you a single instance of a block of buildings to illustrate this section of my subject, but I am afraid had I been so minded I could have repeated that class of illustration only too often. I have had a photograph taken of a block of buildings recently erected on land cleared by the Metropolitan Board of Works, for a street improvement costing a million and a quarter sterling to accomplish. Yet after an outlay so vast the Board allowed a site of the cleared land to be so covered as to produce the "vision of beauty" which is presented in the photograph. I have no hesitation in showing this photograph, because I am persuaded no member of this Association, nor, indeed, anyone worthy of the name of architect, could have produced an elevation so hideous.

In one of the recent street improvements undertaken by the Metropolitan Board of Works, viz., Northumberland Avenue, Parliament thought it necessary somewhat to strengthen the hands of that body in respect to vetoing or modifying the designs of buildings intended to be erected on the cleared land in the street. A clause was inserted in the Bill giving the necessary powers to proceed with the improvement, by which it was enacted that the Royal Institute of British Architects should have the design of every building to be erected in the Avenue submitted to its Council for any observations or suggestions that body might wish to make with regard thereto. The clause has proved practically valueless, because it did not go far enough in the event of the Council of the Institute declining to approve a design or suggesting modifications therein. There was no penalty for non-compliance with the requisitions of the Institute, and I regret to have to say that members of the profession who sign F.R.I.B.A. after their names, have been so disloyal to the body to which they belong as to pay no attention whatever to the suggestions made by the Council of the Institute in respect of designs prepared by them for buildings in Northumberland Avenue, and in some instances have proceeded with utter disregard to all that the Council have advanced. It is not much to be wondered at that, if great corporate bodies like the City of London and the Metropolitan Board of Works should fail to succeed in obtaining suitably designed buildings on land which they may clear for street improvements, and that the artistic treatment of our leading thoroughfares should suffer in consequence, when it comes to the turn of the smaller bodies—the vestries and the district boards—to operate in this direction, their failures are still more pronounced. But it is in sculpture, in the statues erected to our public men, that we commit the direst mistakes. Who can pass the Peabody statue at the back of the Royal Exchange, or, horror of horrors! that permitted to be erected near Mornington Crescent to perpetuate the memory of Richard Cobden, without a shudder, or uttering an earnest prayer that in these matters Londoners should no longer be able to boast of their local self-government? Who regulates the height of new buildings with regard to the width of the streets on which they front? The Metropolis Local Management Act contains provisions in regard to this essential particular, but they apply only to new streets. But what is a new street? Can a street be considered old, or, indeed, a street at all in the ordinary acceptance of the term, until buildings have been erected on each side of it and for its entire length? Surely some such provision as that set out in Section 85 of the Local Management Act should have been made in the case of a street like Victoria Street, Westminster, where, although the roadway was formed and dedicated to the public prior to the passing of the Act in question, the land abutting on it was not built on for many years after. I am induced to make this observation through noticing the gloomy cavern-like effect produced by the buildings erected in this street, which largely exceed in height the width of the thoroughfare. One can understand that in order to exclude the fierce rays of the sun in such cities as Constantinople, Cairo, or Algiers, the streets therein should be of the narrowest possible width at the pavement level, and the space between the houses still more contracted by overhanging floors, so that at the top storey it might be possible for the opposite neighbours to shake hands out of the window, but, alas! in England the sun is only too frequently conspicuous by its absence, as is proved by the return recently made by the Astronomer-Royal that there have been three entire weeks since Christmas last when the registered sunshine

was nil. Victoria Street, Westminster, for the greater part of its length, is quite dull and gloomy enough owing to its stucco fronts, without having its dullness intensified by the excessive height of the buildings which have been erected on each side of it.

To go back once more to the time "when George the Fourth was king," and contrast this street with Regent Street, one has again to make the sorrowful admission that we have not advanced very much, if at all, in our modern street improvements. It is the custom of many in our profession to sneer at John Nash; to deny that he was an architect, or at any rate utterly to repudiate his claim to the title of "King of Architects," by which he was too fulsomely proclaimed at the time when Regent Street and Regent's Park were being formed. Well, if not a king amongst architects he was certainly a prince among surveyors, and his plans for the formation of Regent Street and the laying out of Regent's Park were, to my mind, eminently skilful. I do not for one moment defend his stucco fronts, which did so much to ruin the art of bricklaying—his sham columns, pilasters, entablatures and pediments—but I do maintain that Regent Street was and even now is one of the pleasantest streets in London through which you can saunter, and this is largely due to the fact that the heights of the houses in that street as he designed and left them in no instance exceeded the width of the street, and there was consequently abundance of light and air. The only mistake in this particular which he made was the Quadrant—in itself very picturesque and effective—but owing to the gloom it created on the ground floor, the impossibility of carrying on business in the shops for the greater part of the year, except with the aid of artificial light, and for other reasons which need not here be referred to, it had to be abolished. One has only to notice and contrast the effect upon one's spirits in walking down Regent Street as compared with that produced by a walk through Victoria Street, Westminster, and it will be admitted that legislation as to the height of buildings in relation to the width of the streets on which they abut is most essential.

Who is responsible for insuring us reasonable facilities for obtaining a good sky-line to our buildings? We all know its value. Reminiscences of charming holiday tours in Normandy, Belgium, and Holland flash across the brain as we dwell on this subject, and pictures of the lovely quaint roofs, gables, and chimney-stacks to be met with in those countries arise in our mind's eye as we pursue the theme.

There were no telegraphs or telephones in the days when those sky-lines were produced, and a good thing too, the lovers of the picturesque will exclaim. But is it not possible to control the hideous effect produced by the overhead wires, which are fast becoming not only a source of positive danger, but also tend to still further obscure the little sunlight we get in London?

Deputations of parochial authorities have waited upon Sir Charles Dilke in his capacity of President of the Local Government Board, asking him to interfere; and to them he replied there was no necessity for action on his part, nor for further legislation on the subject, as the governing bodies of the metropolis already possessed the requisite powers to deal with the matter. Yet they do not, and the evil continues to increase.

Let me give you some idea, by a photograph which I have had taken, of the magnitude of the evil which I am now describing. In the discharge of my duties as a director of a public company I am called upon to sit in a room on the first floor of a house in Victoria Street, Westminster, for a couple of hours once a fortnight, and I am made to gaze upon the hideous structure erected on the roof of the building which faces me on the other side of the road, and which supports the overhead wires represented in the photograph. I am told that this is by no means as unsightly as some erections for the like purpose which have been set up on the roofs of buildings in the City, where the wires are still more numerous than at Westminster. What chance can an architect have of producing a good sky-line in any leading thoroughfare of London, if his building is made to support an erection so hideous as those to which the Postmaster-General and the telephone companies are familiarising us? There can be no possible excuse for so disfiguring London streets except that of economy, for it cannot be denied that, but for the extra expense involved, the wires could be just as well laid under the footpaths as over the housetops. Surely there should be some check imposed even upon so exalted a personage as Her Majesty's Postmaster-General, and æsthetic principles might fairly claim to have some amount of respect shown them by competing telephone companies.

The PRESIDENT in inviting a discussion said the feeling produced on his mind was one of utter sadness, and he could not but feel the slough of despond into which street architecture was thrown. There seemed no escape from bumbledom in this country.

Mr. W. H. ATKIN BERRY, the hon. secretary, said it was more than discouraging that in an age when art was made so much of, and so much talked of, that the public should allow magnificent sites to be spoiled for generations to come. They would, he thought, be able to do little till they could fix responsibility on some one for these egregious mistakes. He proposed a hearty vote of thanks to Mr. Isaacs for his paper, as also for the photographs he had had specially taken to illustrate it.

Mr. L. C. RIDDETT agreed that the Farringdon Street neighbourhood had not been improved by being cut off from the main city and metropolitan thoroughfare. The system of leaseholds had much to do with the state of our street architecture. The Metropolitan Board of Works' regulations were also answerable, as they cut them off from all picturesque projections, and tabooed the use of bay windows. With regard to the latter, there need not be any risk of fire if a sufficient distance were left between them. Londoners who lived over their shops must have a dull time of it, the only view allowed them being that of over the way. Compare Oxford Street with the High Street at Oxford or the street at South Guildford. The difference of appearance was as striking as could be conceived. The Queen Anne style, if it had given them no more than red brick, would have deserved their thanks, for the question of colour was an important one in regard to street architecture. He had no idea that a new municipality would improve matters at all. The laying out of streets and boulevards required, if not a trained mind, at any rate a cultured mind. In Nash's days things were better, when design seemed to have formed part of every gentleman's education. It seemed to him that if they had a municipal body elected in much the same manner as the London School Board, the chances were that they would not get a higher type of men. As to the School Board, barring their buildings, no one could say they were doing anything they ought to do; they were not teaching the children, they were not keeping them out of the gutter. They were doing nothing they were expected to do.

After some observations from Mr. Brodie and Mr. Hunter, the vote of thanks was formally put to the meeting, and Mr. Isaacs replied.

On the proposition of the President, Mr. J. D. Sedding was then elected a member of the Association by acclamation, and the proceedings terminated.

### THE FABRIC OF WESTMINSTER ABBEY.

FOR some time past, says a writer in the *Times*, it has been known that the fabric of Westminster Abbey is in a condition requiring the most extensive repairs. The interior, indeed, is in good order, and it may be hoped that a long time will elapse before any further restorations are necessary to it. But with the outside the case is different. Beneath the coating of grime and dirt with which long ages have covered the structure, and which conceals the decay from the eye of the casual passer-by, there has been long going on a process of decomposition which, if not arrested, must speedily cause the ruin of the building. The Dean and Chapter, well aware of this state of things, have taken measures to be fully and exactly informed of the extent of the danger, and have long been casting about for a means of meeting it. In March 1882 they received a report from Mr. John L. Pearson, R.A., the well-known architect, on the state of the Abbey, which was by no means calculated to set their fears at rest. As this report has now been for some two years before the authorities, there is no indiscretion in our mentioning the principal points of it. Mr. Pearson begins by discussing the history and condition of the clerestories of the nave and transepts, and describes the work as left by Sir Christopher Wren in the beginning of the last century. He charges Sir Christopher, who had undertaken the external restoration of the Abbey, with having cut back the wall surface two or more inches—a treatment which could hardly have answered with the best weather-stone, and which was certain to fail with the softer free-stone that had been used throughout the Abbey. For the credit of Wren, however, it may be remarked that Mr. Pearson's judgment is contradicted by an express statement of Wren's, who, in a letter dated June 1713, when he was a very old man, declares that he faced the walls with Burford stone. It is difficult to decide between two statements that contradict one another so flatly; but whether Wren cut back the face of the walls or not, his restoration of them has not proved very successful. Wren also cut out and replaced the free-stone window-jambs and other features, and apparently in several cases altered the lines in the old mouldings in such a manner as to make it difficult to discover the ancient detail. The Oxfordshire stone which he used, though beautiful in colour and texture, has been clearly shown to be incapable of resisting the London atmosphere.

As regards the wall surfaces round the clerestory windows, wherever the free-stone has been allowed to remain, they have become very seriously decayed, the decay having in some places penetrated to a depth of 7 inches or 8 inches, so that the architect is surprised that the heavy cornices and parapets should have found a sufficient support in so ruinous a wall. Just before his report, in some of the very worst places on the south side of the nave, the superstructure had been removed and the face of the wall rebuilt; but this only went a very little way, and Mr. Pearson's opinion two years ago was that "immediate and very extensive repairs and restorations were urgently needed for the whole of the masonry of these clerestories." Very much the same was his conclusion in regard to the flying buttresses supporting the clerestory walls. In some places they are dangerous, and

in others so decayed that pieces of stone are constantly falling from them upon the lead roofs below. The clerestory of the choir is also urgently in need of repair, though its condition is not quite so bad as that of the nave and transepts. Going round to the south side of the nave, over the cloister roof, the report is of the most gloomy character, declaring that it is scarcely safe to pass along this cloister roof, or, indeed, along any of the lower roofs. "Large pieces of stone are continually falling, being detached by the rusting of the iron clamps with which the masonry was thoughtlessly put together. Very considerable damage has from this cause been done to the western towers, the whole surface of which is disfigured by the bursting off of triangular and other shaped pieces of stone; these heavy pieces fall not infrequently, and do much damage." As to the transepts, that on the south side has been recently restored under the direction of the late Sir Gilbert Scott; and the porch of the north transept is also new. But above that porch the masonry is in places very loose and unsafe, and demands complete and extensive repairs. The stonework of the clerestory of Henry VII.'s Chapel, of the flying buttresses, and of the pinnacles, is also badly decayed, though in this part of the building the ruin may be arrested by timely measures. The cloisters also require some restoration, but they might be allowed to wait till the body of the Abbey has been dealt with.

It is thus evident that if Westminster Abbey is not to be allowed to fall into ruin very considerable works must be at once undertaken in order to save it. The question then arises, How are the necessary funds, which are estimated at from 60,000*l.* to 80,000*l.* to be raised, and by what means may future generations be spared the periodical scandal of discovering that this great historical church has fallen into decay? A slight retrospect of the history of the fabric of the Abbey, with a special view to this question of a fabric fund may here be not out of place, and it will at least show that we of this generation are not alone in making the discovery that a great mediæval building is a costly heritage. While the monastery of Westminster existed—i.e., from Edward the Confessor's reign to the Dissolution in 1540—there seems to have been no definite provision for the maintenance and repair of buildings belonging to the monks. Two reasons may be given for this. The Abbey was in close connection with the Crown, and the abbots were individually of great power and wealth. It was seldom difficult for the monks to obtain what sums were necessary from the king for the support of a building where kings were crowned and buried, and many parts of which had been built by the benefactions of kings. Under Henry II. Abbot Laurence obtained a grant from the King and the Empress Maud for the purpose of repairing the Abbey buildings and reroofing them with lead, and the same abbot, and many of his successors, obtained from time to time leave to impropriate livings for the same purpose—the very converse, it may be remarked, of the proceedings of the present day, when so many of the cathedrals have been mulcted for the benefit of the smaller livings. The contributions made by Henry III. to the rebuilding of the Abbey and the building of the Chapter House are matter of history, and Henry III.'s benefactions were continued by many of his successors. The abbots, again, were generous. The fourteenth century has left numerous records of individual abbots contributing to the work of building and rebuilding, the most munificent of all being Archbishop Langham, abbot from 1349 to 1361, who, both in his lifetime and by his will, gave so much money to the Abbey that by that means, and with aid from Richard II., the building of the nave was pushed forward, the abbot's house and the Jerusalem Chamber were added, and the cloisters completed. But by the time of Edward IV. we find that the Abbey had fallen into an unsatisfactory condition, and that especial efforts were necessary in order to extricate it. A curious letter from the King to the Pope, written in the year 1478, and dated "Ex oppidulo nostro Grenewici," is printed in the history of the Abbey, which was written in the last century by Richard Widmore, appealing in a piteous manner to His Holiness to excuse the newly-elected abbots from the costly journey to Rome for confirmation, on the ground of the poverty of the monastery. The King writes:—

"We pray you that the Apostolic See should condescend to succour the Monastery, which is now not only tottering but almost fallen, and which is on the point of utter ruin. A part of that Monastery, indeed, our ancestors built, and that portion is even now almost wasted by age; but the greater part they left unfinished, and of this up to the present time the poverty of the Monastery has prevented the completion, partly through the expense of the confirmation of the newly-elected abbots, and partly through the badness of the seasons and the floods, which have ruined the greater part of the estates of the Monastery."

A pathetic appeal, truly, and one which ought to find an echo in the hearts of every cathedral chapter and of every country clergyman of our own day, when agricultural distress has once more become a bitter reality.

Neither in Henry VII.'s time, when the royal munificence was expended upon the famous chapel, nor up to the Dissolution, nor during the short ten years from 1540 to 1550, when Westminster was a bishopric, nor on the reconstitution of the Abbey as a Col-

legiate Church in 1560, were any separate estates or funds set apart for the support of the fabric. Dean Williams (1620-1640), who was also Bishop of Lincoln, and afterwards Archbishop of York, spent no less than 4,500*l.* on the church alone, repairing at his own cost the north-west exterior and the chapels on the south-east. Scandal, indeed, said that much of his generosity was at the expense of the prebendaries, but this was expressly contradicted in a Chapter Act of 1638, which indignantly denied that "our dean had done such repairs out of the diet and bellies of the prebendaries and revenue of the said church, and not out of his own." It was clear then, that, under Charles I. there was no fabric fund in existence, and that the general tradition still survived which made the abbot or his successor mainly responsible for the maintenance of the building. It was only in 1662, after the Restoration, that Dean Dolben, afterwards Archbishop of York, prevailed on the Chapter to "assign henceforth one prebend's share"—i.e., one-fifteenth of the total annual divisible income—to the maintenance of the fabric, a measure which was thought worthy of honourable mention in the Archbishop's epitaph. Until the handing over of the estates to the Commissioners the measure introduced by Dean Dolben was adhered to, but it is only too plain that the sum so assigned was totally inadequate. In 1697 a petition from the Dean and Chapter to the House of Commons stated that since the Restoration they had spent nearly 20,000*l.* on the church, but that their surveyor reported that 40,000*l.* more was needed, and, in consequence of this, an Act of Parliament granted to a Commission, on behalf of the Abbey, one-sixth of the proceeds of a duty levied on coals imported into London, the same to be assigned "for the repair of the Collegiate Church and for no other purpose whatever." The Act was to be enforced from 1700 to 1716, and by a new Act in the ninth year of Queen Anne the grant was commuted for a sum of 4,000*l.* annually up to 1724 for the same purpose. But neither these large sums nor the ingenuity of Sir Christopher Wren sufficed to put the Abbey into complete repair. Between the years 1731 and 1741 sums of 4,000*l.* were granted in at least four or five sessions of Parliament; and in those years under the superintendence of Dean Wilcocks, the greater part of Wren's plans were carried out, including the erection of the western towers. We hear no more of appeals to Parliament until the present century, but in 1807 we find the Dean and Chapter petitioning the House of Commons, and stating that during the last twenty years they had expended nearly 29,000*l.* on the church. A committee of inquiry sat, and a grant of 2,000*l.* was immediately made, to be followed up during the years between 1809 and 1822 by grants amounting altogether to 42,000*l.* Since that time, and until the transfer of the estates to the Ecclesiastical Commission, the one-fifteenth share of the divisible income of the Chapter agreed to in Dean Dolben's time was always devoted to the fabric, with the addition of any revenue from the sales of timber and money paid for monuments, and any odd surplus funds of which the Chapter might find itself possessed. The average expenditure in the years immediately preceding the transfer of estates was something over 2,300*l.*—a sum which was largely increased after the commutation.

From Mr. Pearson's report, however, it is plain that this expenditure has been quite insufficient to keep the building in proper repair, and the question which is now under anxious discussion is by what means the very large sum immediately required can be raised. We understand that negotiations are in progress between the Dean and Chapter, the Ecclesiastical Commissioners, and the Government, out of which it is hoped that some prompt and satisfactory solution will be arrived at. What will be the exact nature of that solution is not as yet decided, and it would be premature to suggest any one course in preference to the others which are open. One method, however, we may deprecate, and with all the more confidence since we believe that it finds no favour with the Dean and Chapter. This is not a matter for a public voluntary subscription. Westminster Abbey is not the church of any group of individuals, or of any party, or of any sect, or even of the Establishment itself. It is bound up with the history of the nation. If the maintenance of the fabric is beyond the resources which the Chapter either commands at present or by some judicious arrangement can be made to command, then the responsibility for it ought to fall, not upon a few benevolent individuals, but upon the nation as a whole.

## THE MANCHESTER TOWN HALL CONTRACT.

THE case of Underhay v. Smith came before Mr. Justice Chitty in the Chancery Division on February 21. The questions in the case arose out of the contract for erecting the Manchester Town Hall, which was undertaken by a firm of contractors, Messrs. George Smith & Co. The points in no way involved the Corporation, but were in contest between the representatives of a late partner and the present firm. The case came before the Court upon the report of the official referee as a motion to vary the report. By the articles of partnership between the late Mr. Taylor and Messrs. Smith, Mr. Taylor was entitled to retire from the firm at the end of three years; March 31, 1872, when his share of the profits, capital, and interest on his capital was to be immediately

ascertained. The firm had contracted for a lump sum to build the Manchester Town Hall, and the contract was partially carried out during the existence of the partnership, but a considerable portion still remain unperformed at the termination of the partnership at the date above mentioned. The contract was what is called a losing contract, the estimates having omitted a quantity of ashlar requisite for the building, and on account of this the Corporation paid a sum of 28 per cent. on all the extra work when the contract was concluded. There were other items in the contract on which the representatives of Mr. Taylor contended there was a balance due to the estate. The official referee, before whom witnesses appeared, and who had the case in his Court for some days, made a report by which he found that 4*s.* 4*d.* was the contract price for 73,694 yards of solid and hollows, that 10,000*l.* was the valuation of plant and materials on the works at the termination of the partnership, and that 10,623*l.* was paid by the Corporation of Manchester at the end of the contract as a contribution towards the loss sustained by the contractors, or 28 per cent. on the extra work. Mr. Justice Chitty upheld the referee's report, and made a decree of the amount claimed, 6,623*l.* 8*s.* 2*d.*

## BRONZE CASTING IN BELGIUM.

(Continued from page 131.)

### 3. Retouching the Wax Bust.

THE great advantage of reproducing the bust in wax is that it enables the artist to work upon it, so that the wax bust is not only equal to the original in plaster or terra-cotta, but may become even superior to it; for the artist, on seeing his work in a material of another colour, and after a certain time, may discover certain faults which he can correct in the wax, or if he thinks it necessary he can make such alterations as he may consider advisable.

### 4. Preparing the Bust before making the Casting Mould or Cope.

The bust in wax having been looked over and corrected by the artist, is now placed in the hands of the founder, who begins by building a layer of firebricks of the size required for the object that is to be cast; this layer, for a bust, may be 1 mètre by 80 centim., and 0.25 centim. in height above the floor of the atelier. When ready the wax bust is placed upon it on its pedestal of "potin," and firmly fixed to the brick layer or base. The next operation is one of considerable delicacy, namely, the placing of the runners or channels to enable the liquid bronze to flow through and fill up the vacant space left by the melted wax, and the vents, which are other channels for the escape of the air and gas driven out of the hollow by the force of the liquid metal.

For a bust the placing of these channels is not difficult, but when a complicated work—a group or a large bas-relief—has to be prepared for casting, the proper position of these channels requires considerable study, for if one of them should be badly placed it would compromise the success of the casting.

In order to make a runner for the bust in question, a stick of wax is used, 0.60 mètre long, with a diameter of 40 millim., one end of which is cut or flattened into the shape of the mouth-piece of a whistle; the other end is considerably thickened by the addition of wax, until it has the form of a funnel; it is then bent into the form of a double syphon, with the two parallel branches considerably lengthened. Having thus prepared the runner, in order to fix it three or four thin iron pins are driven, in a straight line, at a distance from each other of 1 centim., into one shoulder of the bust, from which they are allowed to project about 2 or 3 centim.; upon these is pressed the flattened end of the runner, and the joint where it touches the shoulder is then closed with wax, which is melted with a heated tool, thus increasing the solidity of the joints. The vent, which is fastened in the same way on the other shoulder, is a simple straight stick of wax, thinner than that of the runner, also with the flattened end touching the shoulder.

If from any cause the runner and the vent are not firm in their positions, another iron pin is driven into the top of the head of the bust, and the runner and vent are fastened to it with packthread.

The founder has now before him the bust, surmounted by the runner and the vent rising from the shoulders to the summit of the head, like little chimneys, to the height of 15 or 20 centim.; he then proceeds to drive a number of iron pins all over the surface of the bust, through the wax, into the core, the object of which is to maintain the core in its place; these pins must project one-half their length from the surface of the bust.

### 5. The Formation of the Casting Mould or Cope.

The bust thus prepared is placed on the brick layer in the place in which it is to be fired; it is then surrounded by a wooden case, having the form of a four-sided truncated pyramid. This case, which must be sufficiently large to leave a space of from 15 to 20 centim. between it and the greatest projection of the bust, is made of frames placed one upon the other, 23 centim. in height,

the whole, when placed together, having the form of a pyramid ; the first frame, namely, that which rests on the brick layer, being naturally the largest. The case being ready, the cube measure of its capacity is calculated, and the upper frames are removed, leaving only the lower one resting on the brick layer.

The mould is made of precisely the same material as that forming the core of the wax bust ; the requisite quantity is prepared as well as the proper number of measures of water required for mixing the "potin."

As the operation of filling the frames must proceed rapidly, and once begun cannot be stopped, care must be taken to have a sufficient supply of the material at hand.

For the formation of the cope of a large-sized bust, three men are required for mixing the "potin," two for pouring it into the frames, and two for throwing the mixture on to the bust, which is done with painters' brushes, and in such a way as to thoroughly fill up all the cavities of the sculpture.

The three mixers have each before them a vat or bucket containing one measure of water, into which they pour rapidly the dry "potin," which is in the form of fine sand or powder, and this not all at once, but gradually, by allowing it to fall through their fingers ; when the "potin" is all in the water the men work it into a paste with their hands. As soon as it is ready the other men pour one after the other the contents of the three vats or buckets into the lower frame of the wooden case ; in the meantime the mixers are preparing fresh vats of "potin." As soon as the first frame is nearly filled, the second frame is placed above it, the joints being closed with "potin" that has become almost hard, and it is filled in the same way ; at the same time the other two men, armed with brushes, have been sprinkling the bust with the mixture so as to fill up completely all the cavities of the wax bust ; if this is not done with great care and exactitude, any cavity that is not filled with "potin" will retain a certain quantity of air, and when cast the cavity will be entirely filled up with a solid mass of bronze, which would require to be removed by the chaser at a considerable expense, or it may happen that the fault is one impossible to remedy. When all the frames have been placed one upon the other and filled with "potin," the operation is completed, care having been taken to fill the upper frame only to the level of the top of the runner and the vent, so as not to cover them.

A third channel, required for draining off the melted wax, is formed in the same way as the other two, a stick of wax of 30 millim. in diameter being placed at the base of the bust on the slant, so as to facilitate the issue of the liquid wax, the stick of wax being fastened by one end to the wax of the bust, while the other end touches the wood which forms the case. The "potin" having been allowed to harden, which it does very rapidly, the wooden frames are removed, and the cope appears in the form of a block of stone, on the upper surface of which is seen, on the right, the wax of the runner, and, on the left, that of the vent, and at the base that of the drain.

#### 6. Firing.

The block is now ready for firing. A furnace of fire-bricks is built round it, two chimneys being placed on the runner, and the vent communicating with the outer air, and round this furnace a second is built, in which a coke fire is lighted. The fire should be moderate at first, gradually increasing until the mass is baked throughout, so that it is completely red hot to the very centre.

After baking for six hours the block is sufficiently heated to cause the wax to melt, which then escapes through the drain, which is in connection with an iron tube passing through the two furnaces, and communicating with a vat into which the wax flows. When the wax has ceased to flow, the opening from the drain must be carefully closed, in order to prevent any air from reaching the interior, which would be injurious to the process.

After thirty-six hours' firing puffs of blue smoke are seen issuing from the chimneys. This shows that the heat is sufficiently intense to cause the evaporation of any wax that may have remained in the block. After sixty or seventy hours the smoke changes from blue to a reddish hue ; this shows that the wax is completely destroyed. The smoke is succeeded by a slight watery vapour, and the fire is increased until all moisture has disappeared. This is ascertained by placing a cold steel plate over the orifice, upon which the slightest vapour shows itself in the form of a veil or dewlike drops. If at this moment it were possible to look into the centre of the block, it would be found to be of deep red. When all symptoms of moisture have disappeared, the fire is covered up, no further fuel is added, and the fire goes out gradually.

The external furnace is pulled down as soon as the bricks have cooled sufficiently to enable the workmen to do so without burning themselves, and in order to hasten the cooling of the block some of the bricks forming the cover of the interior furnace are also removed. Later this is also demolished, and the moulding-block is allowed to cool. In a word, it is necessary to proceed gradually for the process of cooling as well as for that of firing, sudden changes of temperature being fatal, and the success of the operation depending in great part on the regularity of the process.

The firing being now finished, the block has the same appearance as before, only in removing the chimneys the runner and the

vent are found to be replaced by holes or channels, while another hole will be found at the base in the place of the wax drain. The wax in melting has formed these channels, and has left a hollow space throughout the block between the core and the mould.

Reference has been made above to the use of iron pins pressed into the wax bust.

As long as the core, the wax, and the mould had not been submitted to the action of the fire they formed a solid mass, but with the melting of the wax the core has become isolated, and, as it is formed of exceedingly friable earth, the least motion might throw it down and break it ; this inconvenience is avoided by the employment of the pins above referred to, which, penetrating through the wax, on the one hand into the core, and on the other into the mould, renders the core immovable even after the disappearance of the wax.

#### 7. The Casting in Bronze.

This is the last operation. The block having become sufficiently cool, it is surrounded with iron frames placed one above the other ; the space between the block and the frames is filled by pressing into it ordinary moulding earth. This operation requires the greatest care ; its object is to prevent the block from bursting when the liquid bronze is poured into it, by the pressure of the gas and the expansion of the air while the fused metal is flowing through the mould, a comparatively small quantity of metal in fusion being capable of producing effects of incredible force which it is difficult to account for.

The block being perfectly iron-bound, a basin of iron covered with baked clay, and pierced with a conical funnel, is placed over the runner, and closed with an iron stopper, from which projects a long stem. The hole of the basin communicates directly with that of the runner ; the opening of the vent is left free, but in front of it a small basin is hollowed out of the block. Everything is now ready for the casting.

If the bust is calculated to weigh 50 kilog., 80 kilog. of bronze are put into the melting-pot in order to be certain of having enough metal, and it is necessary to allow for the runner, the vent, and the drain. The bronze, which has hitherto given the best results, is composed as follows :—70 kilog. red copper, 28 kilog. zinc, 2 kilog. tin.

The bronze being sufficiently melted, the crucibles are lifted out of the furnace, and are emptied into the basin above referred to ; a workman at the word of command takes out the iron stopper, the molten bronze flows into the runner, penetrates into the mould, fills up all the hollows, and returns to its level, the surplus metal flowing out at the vent into the basin that has been hollowed out of the block to receive it, preceded by the air and gas driven out by the entry of the metal.

If the operation has been made without producing noise, the casting may be considered to have been successful, but notwithstanding all the care taken to attain success, some fault may have occurred.

The natural curiosity to learn the result may soon be satisfied, for in a quarter of an hour the metal will have cooled sufficiently to allow the block to be broken up.

The workmen begin by lifting off the iron frames, and then removing the earth that was pressed round it, commence to break up the block with iron picks, proceeding with precaution, and as soon as any portion of the bronze shows itself the picks are laid aside for smaller and lighter tools, with which the "potin" that surrounds and conceals the work is at length removed, the bust gradually appears, and it is possible to judge whether the casting has been successful ; the bust itself, however, is covered with a white crust from the "potin" still adhering to it, and which only partially detaches itself. To get rid of this crust entirely is a work of some time.

The runner, the vent, and the drain, which have been transformed by the casting into solid bronze, are now sawn off, the core inside the bust is broken up, and the bust is emptied ; it is then placed for several hours in a bath of water and sulphuric acid, and when taken out is vigorously scrubbed with hard brushes, rinsed in clean water, and allowed to dry. The bust is now handed over to the chasers, who efface the traces left by the runners and vents, remove any portions of metal that may fill up the cavities into which the "potin" has not penetrated, stop up with bronze the little holes left by the iron pins, and in fact place the work in a perfect state, leaving, however, untouched the epidermis of the bronze, for in this consists the merit and value of the "cire perdue" process, which renders so completely every touch of the artist that it seems as if he had kneaded and worked the bronze with his fingers.

The bust, now completed, is placed in the hands of the bronze decorators, who give it a "patina" in imitation of that produced by oxidation. The colour generally preferred for portrait busts is the brown tone of the Florentine bronzes. This artificial "patina" can be produced in a great variety of tones, light or dark, but in every case it is preferable that a well-modelled work should have a dead unpolished surface.

The decoration of a bronze work is a question of taste or fashion for which there is no rule, though no doubt for many the success of a work depends very often on its decoration.

## NOTES AND COMMENTS.

THE Tableaux Vivants, which are to be witnessed on March 12 and 13 in the Prince's Hall, Piccadilly, should be attractive, as the grouping will be superintended by Mr. MILLAIS, Mr. POYNTER, Mr. LONG, and Mr. G. SIMONDS, while Mr. JOHN O'CONNOR undertakes the general arrangements. The subjects selected are from Baron TENNYSON'S "Dream of Fair Women" and "Lord of Burleigh." The first tableau will have HELEN of Troy and IPHIGENIA for subjects or heroines, and will consist of four scenes, viz., first, *Helen*; secondly, *The Flight with Paris*; thirdly, *Helen and Iphigenia*; fourthly, *The Sacrifice of Iphigenia*. Mr. POYNTER will be the director. Next will come Mr. LONG'S four tableaux, which will show the unhappy fate of the daughter of JEPHTHAH, and by contrast that of CLEOPATRA. Mr. GEORGE SIMONDS, the sculptor, will direct the two tableaux of *Fair Rosamond*, and the two of *Eleanor the Queen of EDWARD I.* Mr. J. D. LINTON will have congenial subjects in *Margaret Roper* and *Joan of Arc*. Last will come the tableau from the "Lord of Burleigh," which is under the charge of Mr. MILLAIS. The object of the representations is to raise funds for the Soho Club and Home for Working Girls.

THE fancy dress ball which was given on Monday night in the studios of Messrs. BRITTEN and CARTLEDGE, in Bloomfield Place, was successful, and a great many young artists accepted invitations. The dresses were generally picturesque, one of the best being an Indian chief. The three adjoining studios were utilised for dancing, refreshments, and retiring, and the ball was enjoyable from beginning to the end. Just now fancy dress balls find favour among artists, and the ball at the Institute of Painters in next May is anticipated with much pleasure.

THE District Surveyors' Association, like more important institutions, has been compelled to listen to the cry for reform. It was maintained by one party that there were too few members on the committee, and that the few were apt to take their ease instead of looking after the affairs of the association. The reformers have won the day, and the result of the victory is a larger committee, a president, and a vice-president. The officers elected are as follows:—President, Mr. WOODTHORPE; vice-president, Mr. PARSONS; treasurer, Mr. FOWLER; honorary secretary, Mr. TABBERER; committee, Messrs. BOVILL, CARRITT, CLARKSON, COLLIES, FLETCHER, HANSOM, HAYWARD, KNIGHTLEY, LANSDOWN, MARKHAM, MATHEWS, OLIVER, SMITH, WALKER, WALLEN, WATSON, WOODWARD, and WILLIAMS.

BIRMINGHAM, like most other towns, contains many houses which are unfitted for habitations. In one ward fifty houses have been closed by the owners rather than undergo the expense of repairs. In Key Hill a landlord suggested that rags and paper should be used to stop the holes in his houses. Houses in Devonshire Street are built of mortar which consists of one part lime to fifty parts of sand, the so-called sand being road sweepings; the mortar when touched fell out of the walls. There are houses in the town in which, according to the School Board officers, "one had to grope one's way about on dark staircases at the risk of breaking one's neck." It is alleged that in many cases the tenants could live in better dwellings if they were more temperate, and the squalor that is inevitable in the cheapest class of houses should be a sufficient incentive to exertion and self-denial. It is to be hoped that the new Royal Commission will endeavour to discriminate between the misery of the unfortunate and that of the improvident.

THE Industrial Dwellings Company continues to prosper within the limits prescribed, and at the end of the present month the entire capital of the company, amounting to 500,000*l.*, will be invested. In addition, a sum of 394,000*l.* has been borrowed from the Public Works Loan Commissioners. The dwellings erected by the company need never be vacant. For eighty-three new dwellings in one building there have been 382 applications, and for eighty dwellings in another 323 applications. The company are not satisfied with the Metropolitan Board of Works. A site in Mint Street, Borough, was purchased, because it was understood that it would be

sold with a frontage to the new street, as was stated in the notices and in the conveyances. But the street referred to has not been constructed, and the site is in consequence difficult of access. It was also stipulated that the company's buildings should be erected within twelve months of the purchase of the ground, but fifteen months were lost before the Metropolitan Board of Works would approve of the plans. The company have been in consequence compelled to suspend the works in Mint Street.

THE statement that the Blenheim collection of pictures had been purchased by the German Government is supposed to be premature; but experience shows that in such cases the sale will sooner or later take place. It would be a great acquisition for Germany to obtain possession of the pictures, and all that diplomacy can do will be undertaken. The Court of Chancery is possessed of some authority in the case, and can give or withhold approval of the sale; but it is not difficult to evade the necessary application, and a respect for the law does not embarrass the present owner of Blenheim. The Government and the trustees of the National Gallery have, according to Mr. GLADSTONE, heard "rumours," but it is not considered prudent for the officials to take the initiative, that is, to make an offer. If the pictures are valuable no rules of etiquette should prevent us from securing them at a fair price.

SIR FREDERICK BRAMWELL would seem to have been intended for a popular lecturer, and his skill in making difficult subjects plain has often served him as a witness in the Courts and in Parliamentary committee rooms. He lately discoursed on Thames communications, and almost excited enthusiasm among his auditors at the Royal Institution. According to Sir FREDERICK, London looks insignificant if its engineering works for communication between both sides of the Thames are compared with what has been done in New York, in Liverpool, and other cities. There are three ways of affording access between the Middlesex and Surrey shores—namely, a high-level bridge, a tunnel, and ferries. The cost of the bridge would be about 745,000*l.*, and the annual expenditure 18,000*l.* But preference was given by Sir FREDERICK BRAMWELL to a combination of tunnel and ferries, like that proposed in the scheme of the Metropolitan Board of Works, which consists of a tunnel between the Hermitage Basin and the London Docks on the north side, and Mill Stairs and St. Saviour's Dock on the south, with ferries from the Isle of Dogs to Greenwich, and from North Woolwich to Woolwich.

THE allegations that Scotch pig-iron contains an undue amount of cinder iron has excited anger among Northern ironmasters. But it is admitted by the trade association that the determination of the quality of the iron is undertaken in a way that is only empirical. According to the official defence, "it has never been the custom of merchants and brokers to concern themselves regarding the process of manufacture, but only with the quality of the pig-iron produced." Analysis is scorned by the members of the association. "The manner of determining the quality and of assorting the iron into its various numbers has been to break the pig, and to judge it by the appearance of the fracture." A rough and ready test of this kind is suited to primitive times, and is without any certainty. When it is known that a man like the late ROBERT STEPHENSON declared that the quality of iron could not be judged from fracture alone, and when it is found that the majority of engineers agree with him, it is absurd to say that anyone who doubts the uniformity of Scotch pig-iron is "an interested party." Better tests than the eyes of the members of the trade association now exist, and will have to be utilised if Northern iron is to preserve its reputation.

ANOTHER series of twelve panels, forming part of the internal decoration of the Panthéon, will be uncovered within a few days. These paintings, which represent various scenes in the life of Ste. GENEVIÈVE, the patron saint of Paris, cover the whole of the right-hand wall of the Sainte-Geneviève Chapel. The remaining panels facing them are also well advanced, and, should nothing unforeseen occur to delay the work, the whole of the mural painting in this chapel will be ready by August 15.

## ILLUSTRATIONS.

PROPOSED NEW MEMORIAL CHURCH, RUFFORD.

THIS illustration is a reproduction of a design by Mr. R. W. EDIS, F.S.A., which was exhibited at the last exhibition of the Royal Academy.

THE MIDLAND EDUCATIONAL COMPANY'S PREMISES, BIRMINGHAM.

ONE of our illustrations this week consists of the elevation to Corporation Street of the new premises now in course of erection for this enterprising firm. The building when completed will be six storeys in height above the street level, exclusive of large well-lighted show-rooms for school furniture and other heavy goods in the basement. The ground-floor is devoted to retail purposes in Corporation Street, and to wholesale purposes in Cannon Street. The warehousing fronting the latter street is also carried to a height of six storeys, communication between which will be by one of Messrs. WAYGOOD'S hydraulic lifts, the upper portion of the Corporation Street frontage being devoted to directors' rooms, dining-rooms, &c., for the numerous staff of assistants engaged on the premises. When completed they will form an important addition to the commercial establishments of Birmingham. The architects are Messrs. A. B. PHIPSON & SON, of Colmore Row, Birmingham, and the contractors are Messrs. BRADNEY & COMPANY, of Wolverhampton.

The Midland Educational Company was founded in 1870, and in the Birmingham and Leicester offices an extensive business is transacted in England and abroad. Books and stationery of all descriptions are sold, and printing, bookbinding, engraving, &c., are undertaken. The well-known "Reliance Desk" for schools is made solely by the Company, and was the one adopted for the Prince of WALES'S School at Sandringham.

GARDENER'S COTTAGE, BECKENHAM.

THE cottage shown in illustration contains, in addition to living-rooms for gardener, a two-stall cow-shed, hay-loft, pigeon-house, and cistern-room. It is built of local red bricks and Broseley tiles. The contract was 316*l.*, and the work was carried out by Messrs. HOWARD & DORRELL, of 29 Russell Street, Covent Garden, from the design of Mr. HERBERT D. APPLETON, A.R.I.B.A., of 157 Wool Exchange, Coleman Street.

DESIGN FOR HOUSE AT SYDENHAM.

DESIGN FOR CEMETERY CHAPEL, MORLEY.

THE accompanying design is one of two submitted in competition for cemetery chapels at Morley, by Mr. A. HESSELL TILTMAN, F.R.I.B.A., of 7 John Street, Bedford Row, London. The materials proposed to be used were local bluestones, with Ketton stone dressings. The roof to be of slates. The cost was estimated at 1,200*l.*

## COLOURED GLASS.\*

COLOURED glass windows may be divided into two grand divisions, the eastern and the western—the eastern formed by the insertion of thin unshaded coloured glass into or on to patterns cut in stone, marble, plaster, or wood; and the western, where the glass is fitted into leaden frames and shaded, although I believe the clear glass roundels of the lower windows in Eastern houses are set in lead, both methods having been used in Rome.

In Oriental work, the wide chamfered bars of plaster forming the pattern not only act as a dark separation, confining the radiation to their own chamfers, but when seen at a proper angle the effect of shading is produced. One bright jewelled spot of the pure glass is seen, and the remainder of the colour is but the reflection on the chamfer. The ground is formed in this wise:—The plaster is thinned and pierced with round holes, which are glazed with one colour, though often modified in tone and tint. From the small size of the holes, the radiation would be more confined; yet the light reduces this large area of blank space to a fine network. Although I have never seen it done, I should think this mode of glazing might even be adapted to figures. Of course, in Mussulman countries figures are inadmissible. I believe no complete coloured glass window in the West is older than the

twelfth century, though some of the tenth and eleventh centuries are spoken of.

It seems a contradiction to speak of grisaille windows under coloured glass, but in old glass the grisaille was not white, but of varied light tones, such as sea-green, pale blue, fawn, pink, pale brown, and such pale tints, and the glass was more like onyx, agate, or alabaster than like clear glass. The Cistercians eschewed colour, but tried to make amends for its absence by the choice of rich patterns in the lead-work. In many cases the early grisailles are almost equal in beauty to the finest coloured glass.

I once had a glimpse of the grisaille windows in the cathedral at Poitiers towards dusk, and the impression of the soft and varied loveliness of their pearly hues impressed me only a degree or two less than did the windows of Florence or Chartres.

When grisaille is made of pure white glass, even if it be ground or rough and full of bubbles, nothing more vapid can be imagined, and the introduction of one such window amongst coloured ones utterly spoils their effect in a building.

Even when the glass was of the thickest and best quality, and was greatly varied in tint and tone, it was found advisable to insert coloured bands and jewels, so as to lead the eye to the coloured windows, and to prevent a sudden break of continuity; but there was a general inclination to mingle coloured subjects with jewelled grisaille, or to alternate it with them.

We hear from Theophilus that he had seen, admired, and tried to imitate the coloured glass windows of Sta. Sophia, and we may well believe, from what we know of the mosaics at St. Vitale, St. Apollinaris, and the tomb of Galla Placidia, that the stained-glass windows were not less lovely in colour, and that the laws of harmony were as fully understood.

To whatever cause we may attribute it, the fact remains that the glass of the twelfth and early part of the thirteenth centuries is the most splendid that yet remains to us; the gorgeous colour indulged in by the Romans at Byzantium had no doubt its effect, for that was the centre from which all the arts had flowed. The Roman emperors found the Mosaic for the mosque at Damascus as well as for the Kaabah at Cordova, they found the architect for St. Mark's, and we hardly know when Byzantine influence was absolutely at an end before the final extinction of the Roman empire in 1453, by Mahomet II.

The splendour, too, of the Court of the Catephs must have had its influence on mankind, and doubtless the magnificent stuffs and tapestries made for it found their way into Europe, even if it were only in the shape of presents. The account of the presentation of the ambassador of Constantine IX. to the Caliph-el-Muktedir, A.D. 917, gives us some notion of the wealth and display then existing at Bagdad; and about this time Arab art and learning began to affect the West, though the forms in these twelfth and thirteenth-century windows are still mainly Byzantine.

The glaziers' art was then, too, at its zenith, and it is also possible that at this time the colour sense was exceptionally developed.

We know that Theophilus was a monk, and he apparently wrote his treatise for another monk. If he lived in the twelfth century, his being a monk may account for some of the excellence of the work; but whether the windows were done by monks or laymen, the same qualities would, and will, produce similar effects when the natural gifts exist and grand opportunities for their exercise—I mean a strong desire for the perfection of the art (for the art's sake alone, apart from all selfish considerations), combined with acute observation, untiring industry, and patience.

The twelfth and thirteenth-century windows were of the deepest and richest colours, the ground generally being of crimson and azure, and only rarely of emerald; the figures and objects in the pictures were paler in tone than the grounds, often strikingly original in their harmonies, and between the pictures there was a fully-coloured diaper; and white was used as a jewel so precious, indeed, that the narrow strips were often painted to form strings of pearls.

In the aisles of churches patterned windows were generally adopted, and in the clerestories gigantic figures. If you stand in the round part of the Temple Church you will observe the beauty of the east windows, and particularly the marvellous effect of the main forms of the patterns; but it is in the nave of Chartres that we find patterned windows that exceed in magical beauty any other manifestation of colour that man's hand has achieved. Some notion of their beauty may be got from those at Canterbury. I was unfortunately unable to get some tracings of these done in time.

When we look at Titian's *Entombment*, Bonifacio's *Finding of Moses*, or some of the sketches of Schiavone or Paul Veronese, we think it impossible to find greater beauty of colour; but these masterpieces, as far as their colour goes, leave us comparatively emotionless when put in the scale with these windows of Chartres. We say what geniuses these men were; but when we look at the windows it seems as if some divinity had melted every lovely jewel and every tone of mother-o'-pearl, and poured out a cascade of coloured glory that flames, sparkles, and throbs, that raises us to ecstasies, and makes us thankful that the tempter of mankind is not there to offer us the power of making such for his usual fee, and we ask ourselves if they were really made by men, and not

\* From a lecture by Mr. G. Aitchison, A.R.A., delivered at the Royal Academy on Monday, the 25th ult.

sent down to us direct from heaven, to give us a taste of its delights. We have the apotheosis of colour, and though, on close inspection, we may find the composition ludicrous, and the drawing childish, though the saints have purple or green hair, we are no more disturbed by that than a musical devotee when he hears the most exquisite song sung by a woman with the loveliest and most cultivated voice because she is singing nonsense in an unknown tongue.

After this apogee of the glazier's art two or three causes combined to drag it down; it is undoubtedly the case that this full and rich toned glass did produce, not merely "a dim religious light," but almost gloom, and this rich-coloured glass was probably very dear, the want of funds and of cheerfulness probably combining to urge the introduction of white glass.

So long as this so-called white glass was mainly as low in tone as the coloured, only one object was attained, but it was attained without a sacrifice of harmony; directly the white glass admitted the light freely, the whole window was out of tone, and you were blinded with the patches of light. The third cause was the insane attempt of the glaziers to vie with the painters when they could already produce more divine things. They lost the reality to seize the shadow. Accuracy of form, roundness, and shadow perspective, and aerial tints, so proper and excellent in a picture, where the light is reflected, were absurd in a transparent material, where the light came through the figures, and where the sun blurred or destroyed every outline. But, for all that, the glaziers came down from their glory in the heavens to strive on earth with the painters, and to be ignominiously beaten; and, until the end of the fifteenth century, we gradually pass from poetry to prose. A round or a cusped line in the old glass was a sort of note that a niche was meant; but afterwards the architecture was nicely drawn—at first gilt and coloured, but gradually it became white, with the curving only in pale gold, and filled more than half the window. The figures, too, became better drawn, but their white mantles filled the larger part of the space left; the under-dress, the background of the niches, and the little left of sky beyond the architecture, were alone deeply coloured. Even the flesh became at last white. There were, of course, clever fellows amongst the glaziers; and the velvety quality of the white, like the texture of a cumulus cloud, is fascinating, but the capacity of raising emotion was gone.

In the twelfth and thirteenth centuries the sun adds additional glory to the windows; in the fifteenth and sixteenth it rather spoils them, though you must understand that this does not apply to the fifteenth-century windows of Florence Cathedral.

As to the application of glass it is needless to say we do not want a brilliant light in cathedrals, in churches, in the halls of courts of justice, so pathetically called by the French the halls of wasted footsteps; in the halls and staircases of great public buildings, palaces, and private mansions; and the size of the windows in such places may be enlarged to make up for loss of light. In these stained glass of the most splendid quality may be put, glass of the quality of the finest of the twelfth century or of that of Florence; but, of course, as far as the figure drawing and composition go, we want to have the best that can be got, and I may here remark that when this jewelled brilliancy and depth of colour is got, all decorative wall-painting must be kept simple and unobtrusive, and not try to vie with the gorgeous colours of the glass, but leave spaces comparatively plain for the eye to rest on. I never saw the windows of the Ste. Chapelle in Paris lighted by the early morning sun, but in ordinary daylight the effect of the rich painting and gilding lighted up by the still richer windows is oppressive, and we long for plain stonework or white windows.

But this quality of coloured glass is not suitable for living-rooms; in these we want but little deep or positive colour. If the outlook is pleasant or necessary, the colouring must be confined to window borders, and the colours must be sober, such that will not dazzle, fatigue, or annoy us. Slight colour may be successfully used where a blank wall or an unpleasant prospect is to be shut out. In picture galleries and other places where pure white light alone is wanted, we must banish colour if we cannot so blend it as to make pure white light; still there is ample opportunity for much to be used, if it be but to give a little interest and warmth where half the year the prospect is most dreary, chilling, and forlorn. Nothing is prettier than to turn a skylight into a pergola, with vines and grapes, or to cover it with leaves of the Virginia creeper, or even with some pleasant pattern. A little colour with much human skill is mostly a pleasant object.

It is mainly owing to the Gothic revival that stained glass has been awakened from its long sleep, and has spread itself to such an amazing extent. Not only are our churches and cathedrals being filled with it, but it is a rare occurrence to find a new building or house of any pretension without some specimen of stained, painted, or enamelled glass.

Where the avowed object of the promoters of stained glass was imitation we cannot blame those who executed it for producing imitations. The stereotyped phrase of one at least of the great deceased architects was:—"What would a thirteenth-century architect say of this?" and, if it was not the phrase, it was the thought of many other deceased architects, who, if less able, were more influential. Though we are now beginning to deplore these

forgeries, whether in stone or stained glass, we must bear with what has been done, at any rate when it is not too abominably bad, and only hope that in the future the glass, as well as the stone, may bear the stamp of the century in which they are fashioned, that the figures should at least be well drawn, and the writing be that of our own day. The present European costume is so ignoble that I fear it is beyond the power of art to fit it for a picture. To the best of my belief I have never seen a modern imitation of a twelfth or thirteenth-century window that could be mistaken for a first-rate old one. The best imitations I know are those of the Ste. Chapelle, and, possibly, they might be taken for bad windows of the time, though the whole tone is too uniform. I do not say this out of any love for antiquity. I would, on the contrary, much rather think that the modern windows are the best. "The past is nothing, and at last the future can be but the past," but we must not shut our eyes to facts, and we must so use the works of the past as to enable us to excel them.

### THE SCOTTISH CONSERVATIVE CLUB, EDINBURGH.

THE new club, which has been erected on the site of the old Conservative Club House, in Princes' Street, Edinburgh, has been opened. The style adopted is Early Italian Renaissance, and the effect is most pleasing. The Princes' Street elevation is 76 feet high from the pavement to the cornice, and 95 feet to the ridge of the roof, and is divided into seven floors, two of which are in the roof. The stone-work of the street floor is rusticated, and all above is plain ashlar, finished with a carved frieze and cornice, from which, without the intervention of the usual blocking course, rises a steep red-tiled roof. At the level of the first floor there is a balcony extending along the whole front. The oriel window, which projects very little, is carried up as high as the smoking-room or second floor, where there is a small balcony extending across the two eastmost windows. All the windows have architraves—those on the dining-room floor being pedimented, alternately circular and triangular; while the smoking-room windows have cornices, and the upper or bed-room windows architraves only, used as an enclosing line on all sides of the building. The entrance to the house is by a spacious arched door and vestibule to the hall and staircase, which form important features in the internal disposition of the building. The walls are panelled with oak five feet in height, and the floors laid with marble mosaic, with ornamented panels and border. The hall is warmed by an open fireplace in oak and marble, with marble fender, tile hearth and sides, and dog grates, while a clock, encased in a circular oak frame, rests over the mantelpiece. Ascending three steps is the grand staircase. It is treated in the Italian manner, is of Arbroath stone, 8 feet six inches wide, and has a carved oak balustrade and hand-rail. Two sides of the staircase are arcaded, and the stair is worked through these; and along the other two sides to the dining-room landing, and from various points, the perspective effects produced by the combination of the stair and arcades are successful. The stair is lighted by a large three-light window, filled with stained glass, and forms a memorial of the late Lord Beaconsfield. The centre light is fitted with an emblematical figure of Britannia, with the motto "Imperium et Libertas"; and in the side lights there are figures symbolical of politics and literature—the arms of the late earl, his favourite flower (the primrose), and other devices being also introduced. In harmony with the building the treatment of the windows is Italian, the glass-work being entrusted to Mr. Ballantyne, Edinburgh. On the left of the staircase the morning or reading-room is situated. It is a large L-shaped apartment—the shorter arm being separated from the longer by an arcade of two arches. In finishing this room walnut has been used, and the constructional beams carrying the floor above form the design of the ceiling, and are cased in that wood. There are three fireplaces in the room, two of which form an important feature in the design of the room, and over one of them a panel is provided for a portrait. From the first landing of the stair a broad corridor with vaulted ceiling, extending backwards to Rose Street, gives access to the library, parlours, members' and strangers' billiard-rooms, and lavatories. The library, which is lighted from the roof, is finished with Sequoia wood, which has somewhat the appearance of cedar. The four sides of the room are fitted with bookcases, one of them having a fireplace treated architecturally, and having a place for a portrait. The billiard-rooms, which are finished with darkened oak, contain three tables, two in the members' room and one in the strangers' room. Both rooms are fitted up with settees on a raised platform. Ascending the grand stair, which does not extend beyond the first floor, one reaches the dining-room, a large and lofty apartment occupying the entire front of the building. Oak has been adopted in the finishing of the dining-room, the walls are panelled to the height of 9 feet 6 inches, and a large fireplace is worked in at each end of the room, having panels for pictures. The ceiling of the room adds much to its architectural effect. It is divided into compartments by large beams with carved corbels transversely, and longitudinally into five panels in the breadth by smaller beams,

the intermediate spaces being plastered and capable of decoration. A private dining-room, secretary's and house-steward's rooms, and a set of lavatories are situated along a corridor on the same floor. From this corridor access is obtained to the service-stair, which begins at the basement with an entrance from Rose Street Lane at the ground-floor level, and is continued to the top of the house—nine floors in all. All the service-rooms are reached from this stair, which keeps these apartments entirely distinct from the public parts of the house. At the end of the corridor there is a stair which leads to the members' bedrooms. Returning to the grand stair, a smaller stair branches off to the left and leads to the second floor. To the front is the members' smoking-room, which occupies the entire front of the building to Princes' Street, while immediately behind this is a large smoking-room for strangers, and a card-room, waiters' rooms, lavatories, &c. The remainder of this floor to the rear of the front block is entirely given up to members' bedrooms. The ascent to the next floor, which is entirely occupied by members' bedrooms, is by the bedroom stair. Conveniently situated among the bedrooms is a bedroom, footman's room, and brushing-room, with electric bell communication with all the bedrooms. The floors above are reached by the service stair, and are given up to women servants' apartments, while the kitchen, pantries, and larders are situated at the back. The topmost floor to the back is utilised as a laundry and wash-house, the roof of which is fitted up as a drying-place. Over the service stair and higher than all the rest of the building is a tank-room for water cisterns. The kitchen and offices are at the top of the house, and are, it is understood, the first of the kind that have been so built in Edinburgh. The kitchen itself is a large and lofty apartment, lighted from the top and north side, with mechanical arrangements for opening either side along its entire length for ventilation. Orders from the dining-room are despatched to the kitchen by means of a pneumatic tube, and one cage of a double-hand lift conveys all food down to the dining-room, the other cage bringing up the dishes, which are at once despatched for cleaning to the dish scullery, close at hand. Every endeavour has been made, and that successfully, in planning the building to provide a quick despatch and a complete separation of those parts of the building devoted to the service from public rooms. To economise labour, besides the dinner-lift a special lift has been fitted up in connection with the still-room and one for the wine cellars, and a powerful hydraulic one for the conveyance of stores from the basement to the top of the house and to any floor. Electric bells and speaking tubes are largely used throughout the building, and ample and comfortable accommodation is provided for the large staff of servants required in a building of such dimensions. The total cost of the site, building, and furnishings has been over 70,000*l.*, the building itself costing 32,000*l.* Mr. R. Rowand Anderson, A.R.S.A., was the architect, and the general contractor for the building was Mr. Arthur Colville, Edinburgh.

### BUILDING IN ROME.

THE population of Rome in 1871 was 244,484, and at the end of 1881 it had increased to 300,467, being an average of 5,598, or 2·29 per cent. a year. A greater extent of habitable ground and building of houses corresponds with the increase of the population, and this is linked with financial speculations, buying and selling operations, contractors' undertakings, and other industrial enterprise giving rise to an important movement in business—the only sort of business this which may be said to be really active, and often very lucrative, in Rome. A Scotch gentleman, who recently acquired ground for building purposes, has stated that he had noticed that, having treated with many people to carry out the transaction and for the commencement of the works, they all belonged to other provinces of Italy—proprietors, speculators, or contractors, who have come to settle in Rome. The original seller of the ground belonged, however, to an old family of the town.

For the first materials porzolana and lime are used; these exist in abundance in the neighbourhood. The cement is partly found on the territory, partly from other provinces or from abroad. Bricks are made in Rome; those for pavements come also from Naples and from Upper Italy, and some from Marseilles. The stone "tufa" is quarried from volcanic remains near Rome. For the travertine stone there are extensive quarries at fourteen miles distance. The masonry is generally solid and well done. The price of building ground in some places the most favourable amounts to 160 lire for each square metre (5*l.* 7*s.* per square yard). In the already populated and trading streets it may even be worth 200 lire (6*l.* 19*s.* per square yard).

From September 1870, to May 30, 1883, the number of rooms in the new houses built in Rome amounted to 51,293, which number corresponds much with the increase of inhabitants; so that one may observe that in Rome a room is built in proportion for each new individual in the population. The capital employed for the construction of a room is calculated at 2,000 lire (80*l.*), which would have given an amount of business done of 4,000,000*l.* in the before-mentioned period for the sole work of private build-

ing. The purchase price of land, and the buying and selling from one hand to the other, which so often takes place, ought to be added in order to calculate with some exactitude the total amount of business done dependent on the building of houses by private individuals in Rome. Lately the annual average of 7,170 rooms has been attained, which corresponds to a sum of 560,000*l.* annually employed; and indeed from October 1, 1881, to September 30, 1882 (12 months), the number of rooms newly constructed was 9,640. The Government and the commune have together spent until now in building works and improvements in Rome about 400,000*l.* a year in the average. Now, the commune of Rome has bound itself to employ 6,000,000*l.* in public works in the course of ten years. Adding what the Government has already decided upon spending, and the private house building in relation with what has been before stated, it is anticipated that in the next coming years an annual expenditure in works of 2,000,000*l.* will be realised.

It is well to make known how much has been done until now and prepared by the Government, and also by the commune of Rome, for this purpose, and what is the general condition of the city of Rome at this moment. The Government have adopted several legislative dispositions which, though apparently different, unite in one only and sole idea—that is, to render Rome more adapted to its high office. The embankment of the Tiber is intended to guard against inundations, the military defences to render Rome secure in case of war; the new streets and public works inside the walls, and the agricultural improvements outside the walls, have for object to increase the commodities of her existence, and surround the city with a healthy, flourishing, and cheerful country expanse. This last project, of the highest interest for the future of Rome, has been defined in a legislative form in the last sittings of the Parliament, after long study and many discussions.

The day's work of a carpenter is ten hours, with two or three hours' interval for dinner. His apprenticeship lasts from the age of ten until he is twenty. A master carpenter earns from 2*s.* to 2*s.* 10*d.* a day, and a workman from 1*s.* 7*d.* to 2*s.* Masons work nine hours in winter, and ten in summer, with a long interval for dinner. The apprenticeship lasts from ten or twelve to the age of seventeen or eighteen. Master masons earn from 1*s.* 10*d.* to 2*s.* 5*d.*, and apprentices and boys 1*s.* 5*d.* to 1*s.* 8*d.*

### GLASGOW ARCHITECTURAL ASSOCIATION.

THE sixth of a course of lectures was delivered on Tuesday night by Mr. James Sellars, the subject being "Fact v. Fiction." There was a large attendance, the president, Mr. P. M. Chalmers, in the chair. Mr. Sellars pointed out to the members, as the coming architects, some causes of the disappointment at times felt by the young practitioner with the imperfect realisation of his fond hopes; more especially regarding the subject of competition were they cautioned, the readiness which architects showed in entering some of these contrasting with the practice of other professions. The matter of estimating and measuring work, its superintendence, and the position occupied by the clerk of works were all considered at length. After some remarks from Messrs. Honeyman, Landless, and Geldard, architects, Mr. Wells, Mr. Buchan, and some of the members, a hearty vote of thanks was awarded to Mr. Sellars.

### THE FORESTRY EXHIBITION, EDINBURGH.

AT the meeting of the Executive Committee of the last International Forestry Exhibition, held in Edinburgh, copies of despatches sent through the Foreign and Colonial Offices were read. Besides the contributions previously intimated from Foreign and Colonial Governments, the State of New Brunswick has promised to send a large collection of their indigenous woods, showing the uses to which they are applied. The Governor of British Guiana has asked for the reservation of a space of 3,000 square feet, and these exhibits will be accompanied by maps illustrating the distribution of the growth of the various woods sent. Within the range of practical forestry, which it is the great object of the exhibition to advance, come the applications of the foresters of our large landed proprietors. These are intended to illustrate in some cases the natural diseases incident to trees, such as that which attacks the larch, &c.; and in others the injuries which have been done to trees by injudicious pruning. The information thus supplied as to the proper treatment of woods will, it is hoped, do much to take away the reproach at present resting on our knowledge of scientific forestry. Wood-working machines of all sorts will muster in great force, and the important wood-pulping industries of Norway and Denmark will be suitably represented.

The Police Buildings, which have been erected at Greenock at a cost of 20,000*l.*, were formally opened on Tuesday.

## SOME NINETEENTH-CENTURY ARCHITECTS.\*

By PROFESSOR T. ROGER SMITH.

THE title prefixed to this paper is so broad, not to say vague, that it will be desirable at once to state more definitely what is to be attempted. It is simply proposed to give some account of a few of the architects, no longer living, who have been for various reasons prominent during the recollection of the writer of the paper, and with most of whom, though not all, he has in some way come into personal relations. Neither the work nor the life of any living architect will be introduced—a circumstance which will remove any inducement to attempt anything so ambitious as a general outline of English nineteenth-century architects; and, in fact, nothing more must be expected than disconnected sketches, fragmentary and slight, but still, it is hoped, capable of interesting you for an hour, and of leaving some impression behind.

Thirty years ago the leading architects may be said to have been Barry, Cockerell, and Pugin, and each of these, in his way, has left his mark upon the architecture of the century.

*Professor Cockerell.*

Professor Cockerell was a man who managed to inspire something like enthusiastic admiration by his high character, his fine works, and the lectures he delivered at the Royal Academy. He travelled far as a student, and during a long time, and was the fortunate discoverer of valuable remains of Greek architecture. He was one of the most accomplished draughtsmen and colourists of his day, and a man of fastidious and refined taste; and his finished drawings, especially those which he contributed to the Academy exhibitions, were masterpieces. His studies, researches, and sympathies all ran in the direction of Classic and of Renaissance architecture; and though he took an interest and some share in the archæological pursuits of his time, I am not aware of his ever having designed or erected any building in any of the Pointed styles. He built for the Bank of England several branches, mostly of Greek architecture, in different provincial towns; and erected public buildings in Oxford, Edinburgh, Liverpool, and London, all of them original in their design and refined in the extreme in their details, but all Classic or Renaissance. Among these works the completion of St. George's Hall at Liverpool was prominent. Elmes, who designed it, died when the shell of the building only was up; and much of the interior, with, I believe, also the architectural surroundings of that splendid pile of buildings, were designed as well as carried out by Mr. Cockerell. He was the surveyor to the Dean and Chapter of St. Paul's Cathedral, and that post gave him an immense amount of pleasure, for he was an ardent admirer of Wren and his work. As Professor of Architecture at the Royal Academy, he delivered lectures which were listened to with profound attention and genuine admiration. Whatever the subject, we knew that we should have plenty of light cast upon it; but we knew also that from time to time there would be thrown out a short sentence of winged words—a maxim, a precept, or a criticism profound, suggestive, instructive—so tersely and often quaintly put that the words would remain in the memory, and so full of meaning that it would furnish food for reflection and consideration for long after. "Be a gentleman," said he one day, "among artists, and an artist among gentlemen." These lectures must have had no small influence on many of those who heard them, and the gallant, generous nature of the man, and the enthusiasm for his art which shone through and brightened up the whole of his life, were quite as influential as his words. Those who had the privilege of knowing him to any extent personally can all bear witness to the charm of his manner, due as much to a straightforward simplicity of character, which was apparent in everything that Mr. Cockerell said or did, as to his singular accomplishments, polish, and ability.

In appearance Professor Cockerell, in the last few years of his life, when alone I knew him, was still strikingly handsome. His gray hair was parted in the middle, his fine features were wonderfully mobile and sensitive, and the expression of his face would constantly vary as conversation went on, now lighting up, now quieting down, in harmony with what he was thinking; while, with the most appropriate gestures, he would emphasise the points of anything that he was saying in a manner more like an Italian than an Englishman.

When after being for some years presided over by a nobleman, a friend of art and artists, the Institute of Architects decided that their President should be a professional man, the unanimous choice of the body fell almost by acclamation on Professor Cockerell; and, when the Royal Gold Medal was granted by the Queen, he was the first architect recommended to Her Majesty to receive it. He was esteemed and recognised by foreign academies and learned bodies, as well as in his own country, and he died full of honours, as well as of years.

*A. W. Pugin.*

A very different kind of man, with very different ways and motives, and exerting a very different influence, comes before us

when we turn from Professor Cockerell to Augustus Welby Pugin. Cockerell was to some extent identified with a style which it seems impossible should ever take permanent root in England. I refer to Greek architecture; and when his work was not Greek it was Renaissance, a style which was beginning to lose ground, and which, though it has been continuously practised ever since, has not been always, or even usually, carried out with the skill, care, and knowledge of detail that mark Cockerell's work.

Pugin, on the other hand, came in on the rising tide of a complete change in taste, and had no small share in directing, popularising, and intensifying that change. His father was of French refugee family, and is best known by the books of Gothic details, and other illustrations of architecture, which he published. His son was his pupil; he was a man of genius and force of character. His knowledge of detail and fertility of invention were immense, but it is doubtful if, with our present experience, we should call him a thoroughly successful architect, as few of his many churches rise to a high standard of excellence. He went over to the Roman Catholic faith, and was chiefly employed on buildings for that form of worship, and his work, though better than that of most men of his day, is often poor and thin, and far from being impressive.

Pugin, however, exerted an immense influence on the progress of the country by his facility as a designer of ornamental metal work, wall papers, glass, and furniture, in all which works he was thoroughly at home, and was constantly fully occupied. He was really the creator of the modern school of art manufacture. He also did much by a series of shrewd, caustic, well-illustrated publications to foster the growing taste for mediæval art and architecture. The "Contrasts" and the "True Principles" are now all but forgotten, but they were as powerful in their day as anything which Ruskin has written has since been.

Pugin was appointed to superintend the details of the wood-carving at the Houses of Parliament, and had also under his charge the metal-work, stained glass, and encaustic tiles, and here there can be no doubt his services were most valuable. Barry was fully equal to the highest work of the architect of the building, which Pugin, even in works of a far smaller calibre, had been barely able to discharge; but it is no disparagement to Barry to say that Pugin was absolutely unrivalled as a master of detail, and that his ornament added a grace to the work which no one else could have so well imparted. Perhaps having alluded to this association, I ought here to refer to the claim, raised long after Pugin's melancholy end and when Barry was no more, that he had been the real designer of the Palace of Westminster. That claim, which it is charitable to consider had its origin in a disordered brain, was finally disposed of by Barry's son; but if anyone is inclined to believe that there was something in it, I would suggest his looking carefully over the vast pile at Westminster and noticing well how masterly is the treatment of the whole, and then crossing to Southwark and inspecting Pugin's most important work, the Roman Catholic Cathedral there. He will find the latter with thin, poor, feeble features, its exterior undignified and its interior by no means impressive, and the better judge he is of architecture the more thoroughly convinced will he be that Pugin, who was so unequal to cope with the moderate difficulties of a church of not very unusual size, was not the man to master the infinitely harder task which Westminster presented.

Pugin built several dwelling-houses which were successful, and he built at his own expense a church at Ramsgate, said to be, though small and simple, his best work. His drawings were wonderfully rough, though effective; but they could hardly have been carried out except by artisans whom he had trained and who understood his intentions; and this he generally managed to accomplish. He must have been a man of immense force of character as well as originality, and he probably did more than any other man to promote what has been termed the Gothic movement.

*Sir Charles Barry.*

Sir Charles Barry ought to be ranked as the foremost architect at least in Great Britain, and possibly in Europe, of the present century. No other man has had so great an opportunity in England in our time as he, and I think no other man has made such good use of his opportunities, great or small, as he made of almost every opening for his talents that was presented to him. In other words, I claim for Barry that he had the most difficult single work to carry out which has arisen, and that he succeeded not only as well, but better than other men have succeeded in less arduous tasks; and that, in addition to this, he has left fewer failures, and a larger proportion of highly finished and admirable performances—apart altogether from the Palace of Westminster—than any English architect of our day.

Probably the two greatest undertakings that an architect can encounter are a church of the dimensions and dignity of a great cathedral, and a secular building of the first importance. Of the two the cathedral may, no doubt, be the higher work of art; but the difficulties of its architect are wonderfully lessened by the fact that it is a product, not of this age, but of some fifteen centuries of continuous unbroken traditions and effect. Limitations, even when they are irksome ones, act as a guide to the architect, and the best designed buildings have probably always been those where

\* A Paper read at a meeting of the Leeds Society of Architects.

site or use prescribed many conditions which it was impossible to escape from, and the worst those where the architect has absolute *carte blanche*. The architect of a great secular building has often little or nothing by way of precedent to guide him. The requirements are modern ones; the scale of expenditure is dictated by the resources of communities whose wealth has been amassed since the invention of steam; and so the designer of a parliament-house or a palace of justice has to originate the *idea* of his building as well as its features, to an extent which is not required of, or indeed possible to, him who designs a cathedral.

Barry was blessed with genius and strong will, a sound constitution, a fertile invention, great constructive ingenuity, and that combination of fine qualities, natural and acquired of taste, eye and hand which go to make an accomplished designer and draughtsman. He had few advantages in the way of early education, but had a long and probably very useful apprenticeship in an office where much of the more prosaic detail of surveyor's work fell to his lot, as well as pure architecture. He inherited a little money at the time when he could best use it, and wisely spent it in a prolonged period of study on the Continent. He was absent more than three years, and travelled and studied during that time in France, Italy, Greece, Turkey, Egypt, Palestine, and Syria; and thus his preparation for professional life extended over no less than ten years, from the age of fifteen to that of twenty-five; a commentary on the notion now not unusually entertained that three years in an office are amply sufficient preparation for the arduous and complicated duties of an architect's profession.

In the early period of his practice Barry built several churches which were not much in advance of the imperfect Gothic of sixty years ago; but in 1824 the Royal Institution at Manchester, from a refined Renaissance design, and one of the works which shows the peculiar bent of his genius was erected; and in 1829 the Travellers' Club House, a comparatively small but very successful work in Italian Renaissance, was gained in limited competition. The Pall Mall front of this design was more or less based on the Pandolfini Palace, in Florence, but the beautiful garden front was strikingly original, and the plan is as happy a composition as any architect could desire to produce. After this success there is no doubt that private commissions, with from time to time a public work, would have continued to occupy Barry; and the way in which they were discharged would have marked him out as distinguished among his contemporaries for skill in design, refinement of detail, and cleverness in planning, even had no great opportunity presented itself. But such a chance came to Barry as no one since Wren's day has enjoyed. The Houses of Parliament were destroyed by fire on October 16, 1834, and after various delays a public competition was instituted, with the result that Barry's design was accepted in 1836, and the work actually began in the following year. From that period till his death in May 1860, he was constantly at work on this great undertaking, which was all but completed at his death. The long period of nearly, if not quite a quarter of a century, during which his active mind and pencil were busy on this building, allowed time for not a little recasting of the design; and though I believe it may be said that the plan was never varied in any essential feature, the treatment gradually changed from Elizabethan to Tudor, and a far greater degree of richness than had been at first thought of was introduced.

The works at Westminster became a real school of art. Barry had the talent (indispensable to the man who would do a great work well) of getting round him men of ability and power as assistants, and he knew how to trust them. Pugin's engagement led to the formation of a kind of museum of works of Tudor decorative art, and many carvers in wood and stone and workers in metal got their best art training in the workshops at Westminster. Mr. Thomas, who looked after the stone-carvers, was a sculptor of the highest talent. Pugin, as we have already seen, directed the wood-carving, metal work, and stained glass; and men of unusual ability were found to fill the posts of clerks of the works. The long and unhappy controversy with Dr. Reid, who was to have arranged the ventilation, and did not, and many other disputes and troubles which are now happily forgotten arose in the course of the undertaking. No doubt for some of these Barry was to blame. He was constantly improving the building, and this means constant change; and, though the result of his efforts was an immense advance upon original ideas, there were many bitter complaints about expense and delay; indeed, it is not too much to say that these complaints and the publicity given them tended for years to render the position of other architects engaged on other works more difficult, and made their relations with their clients less confidential than would have been otherwise the case. A curious and unfortunate result of the great length of time which elapsed was a change in public taste, or at least in fashion, which interfered very much with the due appreciation of this fine building as it approached completion. In 1834 Tudor was quite the fashion, and that portion of the public who cared for architecture, and those architects who practised Gothic, were pretty generally agreed in its favour. Long before 1860, however, the general taste had gone back from Tudor to Decorated, and from Decorated to, or towards, Early English, so that I well remember being told gravely by a man, now of great eminence,

that he did not consider the Palace of Westminster Gothic at all!

There can, however, be no doubt that the influence, direct and indirect, of this great work was extremely powerful and lasting, and that the perfection with which it was wrought out has contributed materially to that influence. The architect has shown himself master of his work, and whether we regard the splendid plan, the general design, the varied sky-line, the beauty of the towers, or the high finish of the detail, we have a building of which England may be proud, and one which fortunately is designed in a style more entirely and peculiarly English than any that either preceded or followed it.

Of Barry's other works only the most prominent can be mentioned. He gained the Reform Club in a limited competition, and at a later period he built, not far from it, Bridgewater House. In London he also erected the Treasury and the College of Surgeons, and these buildings, with those above-mentioned, form his chief record in the metropolis. Out of London there are several princely mansions, such as Cliefden and Clumber, and several public buildings, such as Birmingham Grammar School, and his last and most florid Renaissance work, the richly-ornamented Town Hall at Halifax, to bear witness to his skill.

My personal recollections of Sir Charles are confined to seeing him occasionally at the Institute, where, however, I do not think he often took much part in what was going on, and to one interview from which I came away a good deal impressed with the strong impenetrable manner of the man. I remember well feeling that if one had wanted to persuade him one might as well have talked to a stone wall; and yet it is stated that Barry was very accessible to the advice, and valued highly the opinions of those on whose judgment he could rely on points of construction, and even in artistic matters. Barry published no books, but his official reports and memoranda, of which he had to prepare many, were excellent specimens of clear statement and cogent powerful reasoning in good clear English. He was buried in Westminster Abbey, as were also Scott and Street, and the first time that a flag was raised on the newly-erected flag-staff on the summit of the Victoria Tower of his great work, was when it was hoisted half-mast high on occasion of the architect's funeral.

#### *Sir William Tite.*

The names of some other architects who practised chiefly in the Classic styles must be passed over with rapidity. Among them were Sir Robert Smirke and Sydney Smirke, with neither of whom was I ever brought into contact, and Sir William Tite, a prominent figure in London professional life for many years. Tite was an excellent man of business and made a large fortune, much of it, however, being gained by work in connection with sales and purchases of land, and railway compensation cases. He had the reputation of being a dangerous opponent and a firm friend. He was a man who was proud of his profession, and was generous towards it; and his position as an influential member of Parliament enabled him now and then to stand up for architects and architecture. A tall man—but not handsome—strongly built, with deep lines in his face, a strong voice, he had a singular power of removing all expression from his countenance if he was hearing things he did not agree with; but he could show himself genial, courteous, and kind when business was over. His best and best-known work was the Royal Exchange, which he obtained in competition, the choice having ultimately lain between his design and a very beautiful one by Professor Cockerell.

#### *Mr. Hardwick.*

Mr. Hardwick, an architect like Tite, better known in London than elsewhere, has a strong claim for mention in any paper by the present writer. He was a man of great personal ability and highly esteemed, as singularly upright and honourable. His skill in planning was great, and he was among the first to inaugurate, at the Euston Terminus, the system of railway hotels which has since become so common. His best work was Goldsmiths' Hall, London, an admirable building for its purpose, whether its skilful planning or the general appropriateness of the dignified architectural treatment be taken into account. He was also the architect of the picturesque hall and library of Lincoln's Inn—an excellent Tudor building—which was, however, to a great extent carried out (in conjunction with him) by his son, Mr. P. C. Hardwick.

#### *T. H. Wyatt.*

An architect better known in the provinces, and, like Hardwick, one of a family of architects, was Thomas Henry Wyatt, a most genial man, and a successful practitioner. His best-known work, perhaps, is the Liverpool Exchange, but he obtained many commissions in various parts of England, and led a life of great activity. He, like Cockerell and Tite, was President of the Institute of Architects, and in that position his devotion to his duties and his kindly cordial manner made him very welcome both to the general body and his colleagues on the council. At the time of his death he was erecting a very interesting work—the Consumption Hospital at Brompton—which has been completed by his son.

*Sir Matthew Wyatt.*

From Thomas Henry Wyatt we pass naturally to his younger brother, Sir Matthew Digby Wyatt, who was a more brilliant man generally, and perhaps better known, but hardly so successful as an architect. Digby Wyatt was a highly-cultivated man, most industrious, most energetic, and almost universal in his knowledge of the Fine Arts. His studies and his sympathies were, however, turned chiefly in the direction of Renaissance, and especially Italian art. He had a fine critical taste, and his judgment on points connected with pictures, sculpture, enamels, decorations, was rarely at fault. He was a rapid and effective draughtsman, and altogether an accomplished scholar, artist, and man of the world.

As a young man Wyatt worked a good deal on the preparations for the Great Exhibition of 1851, being, I believe, secretary to the Commissioners for part of the time. When it was proposed to establish the Crystal Palace at Sydenham, Digby Wyatt and Owen Jones were sent all over Europe to obtain casts of sculpture and architecture, and collected that superb gallery of specimens which buyers have forgotten at Sydenham, and which unhappily few architectural students ever look at, much less study.

For the Crystal Palace Mr. Wyatt wrote several of those excellent manuals on art which were published by the directors at the opening, and which now few people know of. He also wrote or edited two or three books on art subjects.

He held the appointment of architect to the Indian Government, and in that capacity designed and carried out the very beautiful Renaissance interior of the India Office, which was probably his finest work, though he erected some excellent houses of large size, and some other public buildings.

Wyatt's influence was mainly directed towards keeping up the traditions and knowledge of Italian and other Renaissance work. His sympathies with Gothic were not keen, and his weight, which was not inconsiderable, was thrown into the opposite scale. He was a most energetic worker, and in fact wore himself out, and had to retire from active practice almost in the prime of life, with his health impaired, unfortunately too seriously for its restoration to be possible. Wyatt was a man of a commanding appearance—tall, strong, with a dark beard, and a fine presence, he could not for a moment be overlooked. Speaking several languages, familiar with many countries, on terms of intimacy with all artists and many persons of distinction, he was at home and at ease in any society and under any circumstances. He was a ready public speaker, an excellent man of business, a good writer, and a clever designer, and being so much, we need hardly add that he was one of the men who raise the credit of our profession, and of whom we ought to be proud.

Wyatt was genial among acquaintances, and trustworthy with friends. I was once concerned with him and Owen Jones in affairs of no small importance, of which I had had little previous experience and they much; and the cordial yet delicate way in which they both let me have the free use of the results of their practice is one of the pleasant things which one not only desires never to forget, but which, when an opportunity like the present offers, one is bound to put on record, and to commend to others as an example.

*Owen Jones.*

Owen Jones, whose name was at one time constantly associated with that of Digby Wyatt, was an artist in the truest sense of the term, and one of the first architects of his day, if abilities are to be taken as a test. He was a highly-educated and accomplished man, and spent, while a young man, much time and no small sum of money in studying and making known to the public the decorations of the Alhambra Palace in Spain. His volume on this building is one of the few fine architectural publications that this country has produced, and its publication made a fame and a position for its author. The Great Exhibition furnished him an opportunity for becoming famous, since he designed and successfully carried out the simple but telling decorations it received; he also planned all the plotting of the space in the building. The success of his colouring led to no small amount of decoration work, and to a great development of other sorts of occupation in connection with the Sydenham Crystal Palace. Owen Jones built the St. James's Hall in London, one of the most original interiors of modern times, and one of the most successful of music-rooms. But though a good deal of work, some of it of an interesting character, passed through his hands, several of his best designs were unsuccessful. He had a very thorough knowledge of the qualities of iron, and far better ideas of how to treat it so as to make it effective than most architects, and he designed a magnificent iron building to stand where the ill-starred Alexandra Palace now stands, and another for erection at Saint Cloud, neither of which, it is hardly necessary to say, ever was carried out. Owen Jones was one of the men with a logical mind who think out the matters to which they turn their attention thoroughly, reduce them to the first principles, and thus can attain something like absolute certainty where common minds cannot get beyond a vague notion. He thoroughly knew what he wanted to arrive at, what means to employ, and what the result of these means would be; and he was thus able to go to work with a directness which gave him prepon-

derating influence. He was a man of striking personal appearance, of very courteous manners and rather retiring disposition; he was a great ornament to our profession, and by his practice and his writings, which though few and short, were cogent, he helped not a little to advance the use of coloured decoration and the right understanding of the principles upon which it should be designed.

The name of Sir Digby Wyatt, whom we reached a moment ago, recalls another set of associations besides those connecting him with Owen Jones. He was one of the examiners in the first Voluntary Examination. The rule which I have laid down for myself prevents my going into the history of all that preceded that event, one of great importance to our profession, for, happily, several of those who carried on the movement which led up to it are still living among us; and without referring to them, and, above all, to my friend and predecessor at University College, who, as honorary secretary of the Institute, made the examinations possible, the story could not be told. Of the five architects, however, who actually conducted that examination (which took place in 1863) the speaker is, alas! the only one left. The three examiners were Sir Gilbert Scott, Sir Digby Wyatt, and Mr. Arthur Ashpitel; the two moderators, Mr. John W. Papworth and Thomas Roger Smith. Let me say a word or two about Ashpitel and Papworth, as, unlike Wyatt and Scott, they might hardly on other grounds enter into our enumeration.

*J. Papworth.*

Mr. John Papworth was a man of extensive attainments, a vast power of work, and an energetic nature. He was one of those who devoted much time and trouble to the elaboration of the scheme of examination and the preparation of the comprehensive list of books which once formed part of it; and he was of great service in that rather troublesome duty, for he shrank from no amount of trouble or pains. There was nothing connected with architecture which he did not know, or, at any rate, did not know about, so that on any subject he could either furnish the information required or tell where it must be sought for. In many matters, such as the work of the Architectural Publication Society and of the Institute, especially in connection with the formation of our library, he rendered essential but unobtrusive service to our profession, and any who knew him will consider that his name ought to have a place among our worthies.

(To be continued.)

**Buckfast Abbey.**

SIR,—In an article on Buckfast Abbey, Devon, which appeared in your paper a week or so since, but which owing to absence I have only just read, the author, Mr. Tom Burgess, F.S.A., says that in the explanatory remarks made by me before a meeting of the Society of Antiquaries, of what was being done at Buckfast under my direction, I appeared not to be aware of the existence of a detailed account of the abbey by Mr. Brooking Rowe, F.S.A. I cannot think how I could have led Mr. Burgess to suppose this, as at the meeting in question I read from Mr. Rowe's book itself the description of the buildings as existing at the end of the last century, which Mr. Burgess inserts in his article. I also prefaced my remarks by giving Mr. Rowe as my authority. I may add that it was the clue given by Mr. Laskey's description of the ruins, in the *Gentleman's Magazine* of 1796, which Mr. Rowe quotes, that guided me to the discovery of the foundation of the abbey church and other monastic buildings uncovered up to the present time. Before last December no trace of these buildings save "the abbot's tower" were visible, the whole having been carefully covered over and levelled at the beginning of the present century. I should be obliged by your kindly inserting this letter.

I am, Sir, yours faithfully,

4 Great Queen St., Westminster:

February 25, 1884.

FREDK. A. WALTERS.

**Llanely Hospital Competition.**

SIR,—In some references which have been made to this competition it has been stated that the designs of Messrs. Wilson & Dyer, of London and Swansea, were placed second by Mr. Salter, the referee.

Will you permit me to say that the order should have been reversed, and the note have read thus:—"Wilson & Dyer, joint architects, of Swansea and London."

Your obedient servant,

CHARLES E. DYER.

2 John Street, Bedford Row, W.C.

**The Death** is announced of Mr. William Huggins, the animal painter, at Christleton, Chester, aged 63.

## WORKS IN PROGRESS.

**The Morningfield Hospital**, King's Gate, Aberdeen, now in course of erection under Messrs. W. Henderson & Son, architects, of that town, is being warmed and ventilated throughout by means of Mr. E. H. Shorland's Manchester grates.

**Messrs. Burt & Potts**, of York Street, Westminster, are now supplying the whole of the iron casements for St. Paul's New School, Hammersmith, under Mr. A. Waterhouse, A.R.A., and also those for the Turner Memorial Home, Liverpool, under the same architect. They are also supplying large quantities for several other mansions in different parts of the country.

**Haseley Manor**, near Liddington, Oxon.—Mr. Tollit, architect, of Oxford, has been executing extensive alterations at this residence, and has fitted the place throughout for gas, which is supplied with one of Müller's patent Alpha gas-making machines for 60 lights, the piping being supplied and laid, and also the machine supplied and fixed, by the patentee, Mr. H. L. Müller, of Birmingham.

**Ashby Lodge**, near Kilsby.—This residence is being considerably enlarged, under the superintendence of Mr. Tollit, architect, of Oxford, and the place fitted with gas to be supplied by one of Müller's Alpha patent gas-making machines of 150 lights, this work being done by the patentee, Mr. H. L. Müller, of Birmingham.

**Messrs. Mappin & Webb** have supplied the very handsome Abbotsford stoves in use at the new Princes Theatre, in Coventry Street, which are giving great satisfaction.

**The Great Northern Railway Company** are establishing a new hospital for horses at Finchley, and are providing a very well-constructed Turkish bath, to be used in the treatment of sick horses. The bath is to be heated by the convoluted stove which has been patented by Mr. Joseph Constantine, of Oxford Street, Manchester.

**A New Memorial Home for Incurables** is being erected at Lisburn, near Belfast, from plans prepared by Mr. Godfrey W. Ferguson, Lombard Street Chambers, Belfast, the contractor being Mr. Robert Corry, also of Belfast, and Messrs. R. Waygood & Co., of Falmouth Road, London, have received instructions to erect one of their patent hydraulic balanced passenger lifts for the use of the patients.

**The Order for the Mosaic Flooring** for the new building of the Birkbeck Institute has been placed in the hands of Messrs. Diespeker & Co., 40 Holborn Viaduct. The same firm have also received several orders from Glasgow, in consequence of the excellent workmanship of the mosaic which they have been laying at Glasgow University buildings, from the designs of the architect, Mr. John Oldrid Scott, F.R.I.B.A.

**Stained Glass**.—Messrs. Garvie & Sons, builders and decorators, Aberdeen, have lately fitted up, in connection with their Union Street premises, the requisite appliances for carrying out the manufacture of cathedral glass, and have secured special artists for the work.

**A New Factory** has been just completed in Stanwell Street, Colchester, for Mr. Kavanagh, from plans by Mr. J. F. Goodey, of Colchester. The arrangements include a lift driven by an Otto gas-engine, and provided with a safety apparatus to prevent accident, in the unlikely event of the steel wire rope giving way. This apparatus has just been tested in the presence of the Mayor and Corporation, a trolley of goods being placed on the lift on the top floor and the wire rope removed, an ordinary hempen cord having been previously attached. The man who works the lift then stepped into the trolley upon the lift, and with a knife severed the rope which held it suspended. In an instant the apparatus on either side of the lift gripped the uprights, and the lift was brought to a dead standstill, the descent in consequence of the severance of the rope being only about 3 inches. The experiment was pronounced by all to be a complete success. The premises were fitted up by Mr. A. Chambers, of Magdalen Street, and the lift and gas-engine were supplied by Messrs. R. Waygood & Co., of Falmouth Road, London.

**Ornamental Wrought-Iron Gates, &c.**, by Messrs. Barnard, Bishop & Barnards, Norfolk Ironworks, Norwich, and London, E.C., have been erected at the Great Eastern Railway Depot, Bishopsgate, E.C. The principal entrance facing High Street, Bishopsgate, is fitted with a pair of wrought-iron gates, 28 feet wide by 10 feet high, hung upon brick piers. The design is of a florid character, and in it are represented fruit, flowers, fish, &c., indicative of the purposes to which the market is devoted. The arms of the company are effectively introduced in the centre of each leaf. At right angles to these, and serving as the entrance up the incline to the depot, is a mighty single gate 28 feet wide by 16 feet high; this is constructed in one leaf, and is hung upon a substantial ornamental cast-iron pier (surmounted by four very large and handsome lamps). This pier alone weighs 11 tons, and the foundation is entirely of iron. It may here be remarked that no quadrants are used for the hanging of this gate, which is only

supported by the pier. This gate has to swing up an incline of 15 inches to 18 inches, and, owing to its weight (some 3 tons), special machinery has had to be constructed for opening and shutting it. This machinery is contained in the wall at right angles to the gate. A similar gate, but of even larger dimensions, 30 feet by 16 feet, forms the entrance at Wheeler Street, and several other pairs of gates of a highly ornamental character, and of great size, shut off the public at various points in the depot. All these gates are constructed with small "clicks" for the ingress of passengers.

**Messrs. Suffling & Co.**, 143 Edgware Road, have just finished the stained glass windows for Almond's Hotel, Clifford Street, Bond Street. Those in the dining and smoking rooms are of large dimensions, and are very unique in their treatment, great brilliancy being imparted by the judicious employment of Venetian fluted glass. The lobby of the dining-room is glazed in roundel work. The same firm last week fixed the new west window in Esher Church, Surrey, replacing the very dilapidated one which was partly blown out by the January gales. The new window is of painted and stained quarry work, and in the large tracery rose bears the sacred monogram and other devices.

**The Approaching Building Trades Exhibition at the Agricultural Hall**.—The arrangements for holding this exhibition, from March 24 to April 5, are proceeding in the most satisfactory manner under the active management of Mr. Philip Shrapnell, the secretary. So far as the number of exhibits are concerned, at present they are about the same as last year; but it is not at all unlikely that by the day of opening they will be in excess of 1883. A large number of architectural drawings will, as before, be exhibited in the galleries; and we are promised some new features in sanitary appliances, ventilation, and heating apparatus. A new grate, made on smoke-consuming principles, and recently introduced into the London market, will be amongst the latter. Speaking from our present knowledge, we have reason to believe that the display generally will be as varied and interesting as in former years.

## CHURCH BUILDING AND RESTORATION.

**Garforth**.—An organ-loft has just been built in the north transept, and the organ moved from the west end and erected therein. The front of the gallery is an arcading of pitch pine, with traceried and cusped heads and moulded and battlemented cornice, the centre portion of the front projecting so that the organist can have a view of the choir. This projection has canted sides, and is carried on moulded brackets. The ceiling under the gallery is richly panelled in pitch pine, with moulded ribs. New windows have been inserted beneath the gallery to give light to the transept. Additional choir stalls have also been provided. The work has been carried out by Mr. John Hall Thorp, of Leeds, under the superintendence of and from designs furnished by Messrs. Smith & Tweedale, architects, Park Square, Leeds.

**Walsall**.—Some time back Mr. Butterfield was asked to inspect and report upon the state of St. Mary's Church, Walsall, and he has now presented a detailed report to the church council, who will shortly lay it before the parishioners. The results of his investigation are as follows:—Estimating the weight of lead necessary for re-covering the roofs, fixing gutters, &c., at 48 tons, the cost in this direction would be about 1,650*l*. A further sum of 2,800*l*. will be required for building up masonry to the lower part of the eight side windows, repairing windows, balustrades, vases, parapets, and cornices, and internal masonry. A sum of 250*l*. is estimated as necessary for a tile floor, and 1,200*l*. for oak seats in the nave, aisles, and transepts. The total estimate is 6,250*l*., from which the value of old lead and other material will have to be deducted. Mr. Butterfield thinks that another sum of 3,500*l*. will be needed for repairs to tower; but in order to make a reliable calculation, it will be necessary to examine the tower from a scaffolding.

**Shrewsbury**.—St. Julian's Church has been reopened after alterations and renovations, which have been carried out from the designs of the late Mr. S. Pountney Smith. The interior has been covered with a thick coat of concrete, on which the new wood and tile floors are laid. The nave and aisles have been re-seated with open seats, in which the old oak has been used as far as possible. The passages of the nave and of the chancel are laid with Messrs. Maw's encaustic tiles, those of the chancel exhibiting a handsome design. The windows of the south side have been re-glazed with rolled cathedral-tinted glass. The colouring of the walls and the whole of the other decorative work have been executed by Mr. John Robinson, St. Mary's Street. The lighting is by means of coronæ and brackets, supplied by the Shrewsbury Gas Company, and the warming by hot water, the pipes being kept above ground, and branching into coils in the vestibules and window spaces, and executed by Mr. W. B. Morris, of Pride Hill. The contractor for the re-seating and general builder's work has been Mr. H. T. Darlington, of the Wyle Cop. On removing the panelling and plaster of the old vestry, traces were found of a pointed arch on each side, north and south of the tower space, in the position proposed for the new entrances; but the masonry which supported

the arches, and through them the entire weight of the tower, was in a terribly shattered condition. All the defective work has been removed, and by shoring and under-building the fabric of the tower has been made firm and secure. The space beneath it now forms the baptistery. Since the death of Mr. Smith the work has been carried out by Mr. J. Nurse, the principal assistant.

**Kirkliston, W.B.**—The parish church, an interesting building of the twelfth century, has been reopened after being closed during the past nine months for repairs and additions. The work has been carried out under the care of Mr. Rowand Anderson, architect, of Edinburgh.

**Hereford.**—The foundation-stone of a church for the White-cross district has been laid. The building is designed by Mr. F. R. Kempson, of Hereford, in the thirteenth-century style, and will consist of nave, chancel, chancel aisle, organ chamber, vestry, north and south aisles, south porch, tower and spire, seating accommodation being provided for at least 600 people. The foundations for the whole building have been put in, but the nave and north and south aisles and south porch and heating chamber only will now be erected. The contract for this part of the work is 3,800*l*. The nave is divided into five bays, and is 27 feet wide by 90 feet long. The aisles are lean-to, and the porch is placed opposite the fourth bay from the east. The church is lighted by seven three-light windows, one two-light window in each aisle, and ten clerestory windows in the nave, six lancets in the west end of the nave, and two lancets in the west end of aisles. Messrs. Huckson & Warwick are the contractors.

**Alne.**—The church of Alne, in the rural deanery of Easingwold, York, has been reopened after having undergone thorough renovation. The church is a Norman structure, with a richly carved Norman doorway, and arch opening to the tower, which is manifestly a subsequent addition. In the interior of the church there is also a Norman font. The gallery on the north side has been removed, and the high-backed pews have been replaced by open seats of oak, erected by Mr. Wilson, of York, from designs by Mr. E. Willink, architect, of Liverpool. The floors of the aisles have been laid with large flags, inlaid with squares of encaustic tiles. The chancel has been re-seated by Mr. Taylor, of Alne, and has been re-laid with encaustic tiles from the works of Messrs. Goodwin, of Lugwardine.

### SCHOOL BUILDINGS.

**Bromsgrove.**—The erection of a school for young children and infants has just been commenced at Sidemoor, near Bromsgrove, according to plans recently selected in competition by this Board, and approved by the Education Department. It will accommodate 150 children. The contractors are Messrs. Read & Sons, builders, Birmingham Road, Bromsgrove. Mr. F. J. Yates, 1 Colmore Chambers, New Hall Street, Birmingham, is the architect.

### ARCHÆOLOGY.

**Discoveries near Rome.**—A discovery of statues, busts, and other works of sculpture, almost equalling in number and importance those found in the atrium of the House of the Vestals, has just been made at a place called Il Sassone, situated between the town of Marino on the Alban Hills and the farm of the Frattocchia, where, at the beginning of the last century, the Constable Colonna was wont to receive and entertain the Popes on their way from Rome to Castel Gandolfo. At that spot the remains of a very extensive villa, ascertained to have belonged to the Voconia Gens, are now being excavated by Signor Boccanera. There have been dug out no fewer than eighteen pieces of sculpture, including statues of Marsyas, of an athlete, a faun, a genius, a Silvanus, and a copy of the Laocoon—the first ancient copy of this group that has yet been found—five marble candelabra, a bust with a curious kind of Phrygian cap, a group of an eagle devouring a lamb, and several pieces of marble, vases, and very fine bas-reliefs. The Marsyas, the athlete, the bust with the Phrygian cap, and the eagle with the lamb all exceed life size, the Marsyas measuring three metres in height. The others are less than the size of life, and the copy of the Laocoon is smaller than the original.

### ART WORKMANSHIP.

**Lincoln.**—A new font has been placed in the church of St. Swithun, Lincoln. The font is octagonal in plan, and upon each face is an arched and cusped niche finished with a crocketed pediment, and at the angles are panelled and gabled buttresses. The panels of the sides are square, and have the following carvings:—The crossing of the Israelites through the Red Sea, the sacred monogram, lilies, and the symbols of the four Evangelists. The tracery is filled in with conventional foliage of varied designs, and adds much to the general appearance. The bowl is massive,

being in one piece of Ancaster stone. It stands upon a shaft consisting of a large central block with eight Irish red marble columns around it, one at each angle. The font stands upon a high step of polished red marble, octagonal in form, with the alternate sides projecting in the shape of a cross. The carving has been executed by Mr. Barrett, and the work has been done from the designs and under the immediate direction of Mr. James Fowler, architect, Louth.

**Messrs. Cotterell's Paper-hangings.**—The city of Bristol has in Messrs. Cotterell one of the most enterprising firms in England. Their collection of wall-papers will, for excellence and variety, stand a comparison with the first Metropolitan houses in the trade. It is their custom to prepare every year pattern-books of the papers in stock, and from the extent of Messrs. Cotterell's trade it is necessary to use for that purpose more than eighteen thousand pieces. We have examined some of the new books, and can testify to the good taste with which they are compiled, and the tact with which present fashions are met. It would be difficult to meet with a tawdry piece of wall-paper among the patterns, although the prices range from 3*d*. to 10*s*. a piece. The new washable papers are seen in many varieties. Architects and builders in the district must find it a great advantage to have so select a stock available, and Messrs. Cotterell are now able, owing to the cheap rates offered by railways, to send their papers to all parts of the country.

### TOWNS IMPROVEMENT.

**Blaydon-on-Tyne.**—Acting under the instructions of Mr. Frank Parmeter, the newly-appointed receiver of a portion of the Towneley estates, Mr. T. C. Nicholson, architect, 24 Grainger Street West, Newcastle-on-Tyne, has just prepared a plan for extensive building operations at Blaydon-on-Tyne. The plan indicates twelve acres of land belonging to the representatives of the late Colonel John Towneley, and is laid out for freehold building sites. The front streets will be 36 feet in width, a width of 18 feet being allowed for the back streets. All the houses will be self-contained, and will have large yards behind. For some years past there has been a demand for houses in the Blaydon district; but, with the exception of the ground laid out by Sir Henry Clavering, there has been no freehold land in the market; and this circumstance led to the decision to allot this portion of the Towneley Estate for building sites. Should the twelve acres already planned not be sufficient, and with the rapidly increasing population of the district the demand is likely to continue, other portions of the estate contiguous to the above will also be offered to builders. The streets will be, as it were, enclosed on two sides, being bounded on the east by Shibdon Dene, a wooded ravine, and on the west by Blaydon Bank, a deep cutting.

### GENERAL.

**The Competitive Designs** for the proposed new War Office and Admiralty are to be addressed to the "judges," and must be delivered before twelve o'clock noon, to-day (Saturday), into the custody of the Clerk of the Works, Houses of Parliament, at the St. Stephen's Porch entrance, in Abingdon Street, and not at the Office of Works.

**Mr. J. M. Gray** has been nominated as curator of the National Portrait Gallery which is to be established in Edinburgh.

**Mr. William Morris** on Monday delivered a lecture on "Art under Competitive Commerce," at the Town Hall, West Bromwich, in connection with the scheme for the establishment of an educational institute.

**A Fine Art Association** is to be formed for the university, town, and county of Cambridge, and a provisional committee was appointed for the purpose at a meeting held on Tuesday under the presidency of Mr. Redfarn, the mayor.

**The Late Mr. J. Moffat**, of Port Glasgow, has left 3,000*l*. to provide a free public library for that town, while the residue of his fortune of 100,000*l*., after paying certain legacies, is to be devoted, it is understood, to the founding of an orphanage on his estate of Carnegie, Port-Glasgow.

**A Building** is to be erected in Weston Park, Sheffield, at a cost of not less than 15,000*l*., to accommodate the collection of paintings recently left to the town by the late Mr. Mappin, of Birchlands. The building will be erected so as to admit of extension, with a view to other bequests.

**The Spire of the Church at Kidwelly**, Carmarthenshire, 180 feet high, and one of the highest in Wales, has been struck by lightning, which carried away 30 feet of masonry.

**Messrs. Grainger & Naish**, of Adelaide, have secured the third premium in the competition for the erection of Government offices at Brisbane, for their plans designed in French Renaissance style.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, MARCH 1, 1884.

### CONTRACTS OPEN.

ASHTON-UNDER-LYNE.—For Building Shop and Cottages at Greenfield. Messrs. John Eaton & Sons, Architects, Ashton-under-Lyne.

ASTLEY BRIDGE.—March 3.—For Boundary Walls, Iron Rails, Entrance Gates, &c., for Cemetery. Mr. J. Lomax, Surveyor, 11 Fold Street, Bolton.

BALIFFE BRIDGE.—March 6.—For Building Mill. Mr. E. Bull, Clare Hall Road, Halifax.

BARNSELY.—March 4.—For Building Three Houses, Blacker Hill. Mr. William Guest, Blacker Hill, Barnsley.

BELEFAST.—March 13.—For Sheds, &c., for Agricultural Show. Mr. W. Hastings, Engineer, Victoria Hall, Belfast.

CALVERLEY.—March 10.—For Works in Building Weaving Shed at Mill. Mr. Jowett Kendall, Architect, Idle.

COBRIDGE.—For Building Methodist Chapel and Schools. Mr. A. H. Goodall, Architect, Nottingham.

CORK.—March 5.—For Additions to Harbour Commissioners' Offices. The Engineer, 10 Lapp's Quay, Cork.

DROGHEDA.—March 14.—For Works at St. Mary's Church. Mr. J. F. Fuller, Architect, 179 Great Brunswick Street, Dublin.

DUNGENESS.—March 6.—For Building Hotel. Messrs. Burrell & Valpy, Architects, 5 Victoria Street, S.W.

EASINGTON.—March 12.—For Additional Buildings to Workhouse. Mr. John Dote, Clerk to the Guardians, Easington.

ELLAND.—March 5.—For Building Warehouse. Messrs. Jackson & Fox, Architects, 22 George Street, Halifax.

GOLCAR.—March 4.—For Additions to Residence. Messrs. John Kirk & Sons, Architects, Huddersfield.

GUILDFORD.—March 7.—For Buildings and Boundary Walling in connection with proposed Hospital. Messrs. Peak, Lunn & Peak, Architects, 3 Market Street, Guildford.

HARROGATE.—For Building Bank and Business Premises. Messrs. H. E. & A. Brown, Architects, James Street, Harrogate.

INVERNESS.—March 3.—For Alterations at Northern Meeting Rooms. Messrs. Matthews & Lawrie, Architects, 2 Church Street, Inverness.

LEAVESDEN.—March 4.—For Erection of Building at Schools. Mr. H. Robinson, C.E., 7 Westminster Chambers, S.W.

LEEDS.—For the Erection of New Premises for Messrs. Julius Sewell & Co. Names to be sent to the Architect before March 8. Mr. William Bakewell, Architect, 38 Park Square, Leeds.

LIVERPOOL.—March 5.—For Contracts No. 4 and No. 5 at Zoological Gardens. Messrs. W. Sugden & Son, Architects, Leek.

LOSSIEMOUTH.—March 15.—For Works in Building Public Hall. Mr. D. Cameron, Architect, Inverness.

LOWER WORTLEY.—March 3.—For Building Methodist Chapel and School. Mr. T. Howdill, Architect, 40 Park Lane, Leeds.

MIDLAND RAILWAY.—March 7.—For Construction of Gas Works, Bromsgrove. Drawings, &c., at the Clerk of Works' Office, Camp Hill Station, Birmingham.

MIDLAND RAILWAY.—March 7.—For Additions to Engine Shed, Bath. Drawings, &c., at Clerk of Works' Office, Temple Meads Station, Bristol.

MIDLAND RAILWAY.—March 7.—For Repairs and Painting, Giggleswick Station. Specifications at the Engineer's Offices, Derby.

MIRFIELD.—March 26.—For Building Warehouse, Willey Rooms, Tenter Stoves, &c. Messrs. Kirk & Sons, Architects, Dewsbury.

MORLEY.—March 1.—For Building Minister's House. Mr. A. Battery, Architect, Queen Street, Morley.

NEWPORT.—March 13.—For Erection of Gasworks. The Engineer, Gas Offices, Mill Street, Newport, Mon.

ORMESBY.—March 5.—For Additions to Railway Station. Mr. W. Bell, Architect, Railway Offices, Northgate, Darlington.

PETERBOROUGH.—March 7.—For Alterations to House, Priestgate. Mr. H. M. Townsend, The Precincts, Peterborough.

PRESTON.—For Building Wesleyan Chapel. Mr. Robert Curwen, Architect, 103 Palace Chambers, Westminster, S.W.

SHELF.—March 1.—For Additions to Dean House. Mr. H. Oddy, Dean House, Shelf, near Halifax.

STALHAM.—March 10.—For Building Baptist Chapel and School. Mr. G. Baker, 28 Queen's Road, Yarmouth.

ULVERSTON.—March 8.—For Enlarging National Schools. Mr. J. W. Grundy, Architect, Brogden Street, Ulverston.

WALLSEND.—For Building Two Villas. Mr. J. Angus, 55 North View, Heaton, Newcastle-on-Tyne.

WANSTEAD.—March 17.—For Additions to Caen Hall Lane Schools. Mr. J. T. Bressey, Architect, 70 and 71 Bishopsgate Street Within, E.C.

WEST BROMWICH.—March 10.—For Building Board Schools at Black Lake, for 1,060 children. Mr. E. Pincher, Architect, 274 High Street, West Bromwich.

WIGAN.—March 7.—For Building Business Premises. Messrs. Scott & Verity, Architects, Clarence Chambers, Wigan.

YEovil.—March 25.—For Erection of Public Baths. Mr. J. Johnson, Architect, 9 Queen Victoria Street, E.C.

YSTRADYFODWG.—March 2.—For Extension of Tylorstown School. Mr. J. Rees, Architect, Pentre, Pontypridd.

### TENDERS.

#### BELEFAST.

For Building House and Premises, Antrim Road, Belfast, for Mr. Patrick Leonard. Mr. G. J. BYRNE, Architect, Belfast.

McLrean . . . . .	£950 0 0
Fulton . . . . .	530 0 0
Kerr . . . . .	927 0 0
Campbell & Lorny . . . . .	920 0 0
Kidd . . . . .	907 0 0
Murdoch . . . . .	837 0 0
Collin . . . . .	810 0 0
ROONEY & MOONEY (accepted) . . . . .	755 0 0
Macaulay . . . . .	696 0 0

All of Belfast.

#### BRISTOL.

For Alterations, Repairs, and Rebuilding Party Wall at No. 1 St. Stephen Street, Bristol, for Mr. Fredk. W. Sinnock. Messrs. J. W. TREW & SONS, Architects, Broad Street, Bristol.

	Repairs.	Party Wall.
Higman . . . . .	£954 0 0	£151 0 0
Gay . . . . .	700 0 0	150 0 0
Cowlin . . . . .	675 0 0	190 0 0

Bastow . . . . .	630 0 0	115 0 0
JAMES (accepted) . . . . .	489 0 0	—

#### GRAVESEND.

For the Erection of a Pair of Villas, Parrock Road, Gravesend, for Messrs. T. G. & G. Sandford. Mr. EDMUND J. BENNETT, Architect, Gravesend.

ARCHER (accepted) . . . . .	£1,054 0 0
-----------------------------	------------

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a **Semi-Vitreous** nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c.

Samples free to Architects and Engineers.

**BANBURY.**

For Erection of Warehouse, adjoining Steam Flour Mill, for the Banbury Co-operative Society.		
Kingerlee, Banbury	£360	0 0
Grant, Banbury	358	10 0
Page, Banbury	353	0 0

Hobley & Bennett, Banbury	340	0 0
Bullock, Wellington, Salop	294	10 0
BAILEY, Leamington (accepted)	289	0 0

**BLYTH.**

For Erection of the Thomas Knight Memorial Hospital, Blyth. Mr. J. HOGG, Architect, 4 St. Mary's Place, Newcastle-on-Tyne.

Accepted Provisionally.

J. & W. Simpson, builder	£1,594	0 0
Bell & Co., plumber	110	0 0
Purdy, slater	51	6 0
Innes, painter and glazier	49	6 0

Total . . . £1,804 12 0

**BOULTHAM.**

For the Erection of an Engine-house and Boiler-house at the Waterworks at Boultham. Mr. TEAGUE, Engineer.

Cowen & Lansdown	£2,448	0 0
J. B. Harrison	2,348	0 0
S. & R. Horton	2,304	0 0
H. S. & W. Close	2,294	0 0
J. M. Harrison	2,246	0 0
Crosby & Sons	2,219	0 0
WRIGHT (accepted)	2,065	0 0

**BURSLEM.**

For Building Church at Porthill, near Burslem. Mr. A. R. WOOD, Architect. Quantities by the Architect.

Bradney & Co., Wolverhampton	£5,270	0 0
Gallimore, Newcastle	4,964	0 0
Grosvenor, Tunstall	4,949	0 0
Inskip, Longton	4,535	0 0
Webb, Silverdale	4,500	0 0
Collis, Longton	4,411	0 0
YORKE, Tunstall (accepted provisionally)	4,389	0 0

**CHIPPING WARDEN.**

For Erection of Chapel and School, Chipping Warden.

Watson & Golby, Napton	£714	19 0
Smith, Cropredy	695	0 0
Hobley & Bennett, Banbury	675	0 0
Horseman, Oxford	670	0 0
Bailey, Leamington	638	0 0
Cotterill, Culworth	615	0 0
Kimberley, Banbury	600	9 0
Lambert Bros., Cropredy	586	10 0
Grant, Banbury	545	0 0
CHERRY & PAGE, Banbury (accepted)	535	0 0

**ELTON.**

For Construction of Covered Tar Tank at the Bury Gasworks, Elton. Mr. J. CARTWRIGHT, Borough Surveyor.

France, Stalybridge	£1,721	11 1
Dawson, Bury	1,508	0 0
Byrom, Bury	1,462	10 2
Dennis, Bury	1,346	12 2
Comfort, Bury	1,328	0 0
NEWHOUSE & WRIGLEY, Bury (accepted)	1,261	18 8

**ENFIELD.**

For new Schools at Enfield for the Guardians of Edmonton Union. Mr. T. E. KNIGHTLEY, Architect.  
Through an irregularity in the delivery, the Tender of Messrs. Howell & Son was not discovered till a formal resolution had been passed accepting Mr. Wall's offer; and as he had done work before for the Board, and given satisfaction, they refused to reconsider their decision. The list of Tenders for this work will be found in *The Architect* of February 23.

**HOVE.**

For Alterations and Additions to St. Catherine's Lodge, Hove, Brighton. Mr. WM. FLOCKHART (Messrs. Wallace & Flockhart) 27A Old Bond Street, Architect. Quantities by Mr. Frederick Thomson, London.

	Main Estimate.	Extra for Alterations to fronts.	Extra for Wainscot.	Deduction if for Conservatory in deal.
Goddard & Sons, Farnham	£1,437	0 0		
Kempe, Brighton	4,197	0 0		
Ancombe, Brighton	3,836	0 0		
Howard & Co., Brighton	3,674	0 0		
Parsons & Sons, Hove	3,645	11 10		
Dowsing & Sons, London	3,370	9 0		
Light & Co., Portsmouth	3,198	0 0		
Peters, Horsham	3,100	0 0		
Toms, London	3,043	0 0		
Taylor, Brighton	3,026	0 0		
Webber & Sons, Hove	2,987	0 0		
Reynolds, Hove	2,937	0 0		
Robertson, London	2,813	0 0		

	Extra for Alterations to fronts.	Extra for Wainscot.	Deduction if for Conservatory in deal.
Goddard & Sons	£110	£155	£52
Kempe	136	310	70

SEWER GAS.

AS AN ABSOLUTE PREVENTIVE  
of the entry of Sewer Gas into Dwelling  
Houses by way of the most dangerous inlets,  
viz., the waste and overflow pipes from cisterns,  
baths, lavatories, and sinks, DOULTON & CO.  
strongly recommend the use of

MANSERGH'S  
IMPROVED GULLY.

By the insertion of this Gully in the line  
of drain OUTSIDE the house, the common and  
UTTERLY USELESS bell-traps may be dispensed with,  
and direct communication with the sewers is  
effectually broken.

"This is undoubtedly a most important and  
effective trap for preventing the entrance of sewer  
gases into dwelling-houses."—LANCET.

PRICE 10s. 6d. EACH, COMPLETE.

MANUFACTURED BY

DOULTON & Co.

High Street, Lambeth, S.E.

DEPOTS:—

GRANVILLE STREET, BIRMINGHAM,  
AND  
100 SOHO STREET, LIVERPOOL.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ESTABLISHED A.D. 1774.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large  
quantities for Greenhouse Shades, Public-house Shutters, and  
other heavy work. The Manufacturers would recommend it for  
its strength, and the large amount of wear in it, consequent on its  
peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND  
BLIND LINES (two Prize Medals awarded). The manufacturers  
of the above articles particularly wish to draw the attention of  
the trade to their Imperial Patent Flax Sash Lines, of which  
they are now making five qualities; and they strongly recommend  
that in all cases they should be purchased in preference to the  
patent lines made from jute, which article has neither the strength  
nor the durability of flax, consequently cannot give so much  
satisfaction to the consumer.

They also invite the particular attention of the trade to their  
IMPERIAL PATENT BLIND LINES, which are very superior  
to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Mer-  
chants, Factors, and Wholesale Houses in town or country.

N.B.—Please note that all our goods as advertised above are  
labelled either inside or outside with our Trade Mark—The  
"A.W.O.R."

PADDINGTON IRON WORKS, LONDON, W.,

AND SANDYMOUNT FOUNDRY, LLANELLY, CARMARTHEN.

**PATENT WROUGHT-IRON SASHES AND WROUGHT BOSSES**

SPECIALLY ADAPTED FOR WAREHOUSES, SCHOOLS, AND PUBLIC BUILDINGS.

CABLE LIGHT

The Patentee begs to call particular attention to the great strength of this construction. The Bars and Bosses, being of malleable wrought iron, form an exceedingly firm joint at the intersection of bars. They are durable, and of light appearance, the Bosses being small and not unsightly. They can be made at very short notice, and at the price of an ordinary cast iron sash.

PRICES UPON APPLICATION.

CABLE LIGHT.

CLOSE BAR SASH (obviating use of Window Guards.)

ORDINARY WAREHOUSE AND SCHOOL SASHES.

VENTILATOR

Back view of Boss, full size.

Section through Boss, full size.

These can be glazed flat, like ordinary wooden sashes, without the corners of the panes being chipped off.

Front view of Boss, full size. Obscuring no appreciable light.

# The Architect.

## MEDALS AND PRIZES AT THE INSTITUTE.

ENGLISH institutions, as all of us know, are everywhere moving with the times, some more decidedly, some less; and amongst the rest the Institute of Architects ought to be moving. We see, for instance, the clerks of works publishing a periodical. We see the Association of district surveyors assuming an attitude of energy, appointing a President, Vice-President, and large Committee to indicate its resolve to serve the general interests of building progress by the practice of corporate activity. We may

perhaps all the more expect and hope therefore to see the Institute, in the present somewhat critical position of all things architectural, preparing in one way or another for the inevitable pressure which modern vitality is everywhere occasioning. And such, we think, is really the case; for the meeting of last Monday, although scantily attended owing to the bad weather, was singularly characterised by a display on the part of the members at large of that personal earnestness in business which is the lifeblood of a guild, and which has been rather kept in check during the last few years by a peculiar course of treatment, under the direction of certain doctors whose intentions, to give them their due, may have been on a higher level than their skill.

It is to be regretted very much that the gold medal of the late Mr. GRISSELL—a builder's prize for building science—has this year attracted not a single competitor. We cannot help, indeed, making this a matter of distinct complaint against our rising men of the junior class. If their artistic ambition is, as many say, a good deal overdone just now, their scientific knowledge most certainly is not; and we do not hesitate to say that, of all the prizes at the disposal of the Institute of Architects, that which is meant to be so handsome a reward for the cultivation of constructive science might at the present moment perhaps be made of more practical advantage to a judicious beginner in business than any other on the list. Not only so, but inasmuch as the members have shown so laudable a readiness to supplement this prize (as also others) by means of a second and even a third acknowledgment of merit, so much the more may we recommend our young men to take up the subject with a serious determination to do justice to it, and to themselves.

For the prize endowed by the late Sir WILLIAM TITE there were, as is not always the case, several good designs submitted; and everyone will be ready to congratulate the winner, Mr. POLEY—who is one of the new Associates by examination—upon his success. None the less, however, may we congratulate Mr. CAMPBELL, of Glasgow, upon the award to him of the second reward of an Institute medal, and especially upon the stout fight which was made on his behalf—or rather on behalf of his work—for a money addition, in recognition of merit which had only lost the first place before the committee of private adjudicators by a very close vote. He may possibly be amused, also, and edified when he comes to know that this generous proposal, by some strange twist of temper, came to be the cause of what we take leave to hope may be the final struggle between the spirit of independence in the body of the Society and the incomprehensible self-assertion of the little knot of compensation surveyors and competition adjudicators who have recently been able to assume a position of arbitrary authority as the representatives of “order,” not only as Heaven's first law, but much more as King WILLIAM the Fourth's, it being proclaimed, as they say, once for all in the charter granted by that nautical monarch, that (although Britons never, never must be slaves) “British architects” never must be anything else. The sitting President was, in short, led to signify his personal opinion upon this outrageous doctrine with such characteristic warmth as to bring down upon the chair, for the first time in the history of the Institute, the express rebuke and defiance of the meeting. It was the Sedan of the “new system”; and perhaps Mr. CAMPBELL had the benefit of this in the unanimous award of his well-earned gift

of money. At any rate, it becomes all the more important that, in the election of a new President and Council now coming on, all members of the Institute who value the true dignity of their guild should be a little more on the alert than they have been. As Sir WILLIAM HARCOURT in his forcible way pointed out the other day, in connection with another matter of annual appointment, English electors have themselves to blame if they do not make their act of election the reality which it is by law intended to be.

The SOANE medallion, with its 50*l.* for travelling money, was won by Mr. HARRIS, of Bolton-le-Moor, by means of a highly creditable set of drawings; and a second prize was awarded in the shape of a medal of merit to Mr. CRESWELL, whose address is in London. In this competition also the question was raised whether a third prize might not be bestowed upon the author of a design which was of striking character. The claim, however, was not successful. The subject happened to be a “Theological College,” and this design was in a Classic style. In the opinion of one of the members present—not himself, by the way, a “Gothic man”—this circumstance placed it *hors de concours*; as if theology could not be rightly acquired except amidst the quaint features—and grotesque ornaments, perhaps—of mediæval fancy. This argument, however, although not resented by the critical common sense of the meeting as it might have been, was at least not further alluded to; for indeed the drawings—one might almost take a wager they came from the city of “Greek Thomson”—had demerits much less visionary in their nature. In a word, the perspective view was rendered in the vehement manner of Mr. BERESFORD PITE, and the meeting resolved that there had been enough of this. Mr. PITE, it will be remembered—it will not be forgotten for a long time—produced in a recent competition for this same prize a “West End Clubhouse” of such strange device as to involve a whole catastrophe of taste, and with this production, in spite of protest, he actually won—we cannot say in a canter, but rampant—kicking, as it were, all other West End clubhouses into the limbo of the too-utterly commonplace. Perhaps it was excusable, if no more, in view of the success of this powerful piece of work on a former occasion, that another young gentleman should make an adventure in the same vigorous direction with a hope of the same satisfactory result; but at all events the certificate of merit was flatly refused—and we cannot so far regret it—although, no doubt, the author is left to congratulate himself upon having made his work the subject of an earnest debate, in which no speaker could deny that he was deserving of commendation. After this, wolfish draughtsmanship is not to be encouraged.

No less than five acknowledgments were cordially awarded to those sets of measured drawings, all of churches this year, which almost always seem to be so particularly well done as to constitute in one sense the most valuable of the competition works of the Institute. Mr. ANDERSON of Kensington, Mr. WILSON of Manchester, Mr. SUTTON of King's Lynn, Mr. MITCHELL of Clapton, and Mr. DOWNES of Hull, all deserve the utmost praise. A proposal was debated for publishing such productions as these in the Institute Transactions, and perhaps all parties might be much benefited if it could be carried out.

Four essays had to be dealt with on the subject of “Staircases,” and Mr. MARWICK of Edinburgh, an Ashpitel prizeman, carried off the medal. One other essay at least seemed to be very creditable to its author. It may be explained that the chief merit of these dissertations lay in the collections of sketches, engravings, and photographs by which they were copiously illustrated.

It can scarcely escape notice that the majority of the prizemen above catalogued are persons resident in provincial towns—six of them, indeed, as compared with four Londoners. Although the test is obviously not conclusive, we regard this as affording valuable evidence of the spread of advanced architectural skill all over the country. As we have often had occasion to say, the ascendancy of the metropolis in architectural practice, and in artistic taste particularly, is now a thing of the past. London is still a kingdom in itself, architecturally as otherwise, and it is the head-quarters also of English architecture as of all else; but the “country architect” is no longer the mere country cousin of the “London architect,” awkward and shy. He “runs up to town” any day, and sees all and knows all that “town” can offer him; his education is the same education, and his work the same work; and if the question were pressed upon us whether in some instances

his quiet surroundings in a cathedral close or a rustic lane, instead of a London street, may not be more rather than less conducive to the cultivation of artistic grace, we should hesitate very decidedly to answer in the negative.

### ARTISTS AND PATRONS.

IF the sarcastic article by M. DARGENTY which appears in the last number of the *Courrier de l'Art* is to be taken as an indication of public opinion in Paris, we may assume that in the MEISSONIER-MACKAY affair the painter has made a *faux pas*—and in France that kind of mistake is rarely forgotten. M. DARGENTY says he has had his information from a friend who, while fully cognisant of all the circumstances, is entirely unbiassed; and, unless there is an error in the account, it is difficult to avoid the conclusion that the American millionaire has not been mercifully treated. The story, of which so many versions have been repeated, would seem to be as follows. About two years ago Mr. MACKAY was asked by one of his countrymen to accompany him to M. MEISSONIER'S studio in order to see a portrait of Governor STAMFORD. The artist and Mr. MACKAY were not strangers to one another, and the latter naturally expressed his admiration of the latest among the painter's works. Whereupon he was surprised to hear M. MEISSONIER declare that his best work would be found in a portrait of Mrs. MACKAY, if ever he were allowed to paint one, as it was a subject which he greatly desired. The painter's own words were more fervid and characteristic:—"Je désirerais vivement faire le portrait de Mme. MACKAY; je suis certain que j'en tirerais le plus beau morceau de mon œuvre, la perle de mon écrin." A proposal of this kind may not be unknown among struggling artists, but artists in M. MEISSONIER'S position should not seek commissions so plainly. It is possible that Mr. MACKAY'S first thought was the enormous cost of so interesting an experiment, for he was not elated, and merely promised to talk over the matter with his wife. What woman, and especially an American woman, would hesitate when she heard that a famous artist like M. MEISSONIER was ambitious to give immortality to her appearance? Mrs. MACKAY consented; and we assume that there was a good deal of speculation that night in the costly house near the Champs-Élysées about the kind of picture that the artist contemplated. One thing was certain, that it was not to be a mere portrait, like the hundreds that are to be seen every year in French and American exhibitions, but a picture. In the immortal historical picture of the PRIMROSE family the Vicar's wife was represented as VENUS, and the Vicar in his gown and band was seen presenting her with his tracts on the Whistonian monogamist controversy; but although Mr. MACKAY was to have the privilege of paying for the picture, it was never supposed that he was to be depicted. The canvas was to be appropriated to Mrs. MACKAY and whatever accessories the artist might select. M. MEISSONIER was duly informed of the resolve of the family council, and he repeated that it was his intention to produce a *chef-d'œuvre*. Not a word was said about cost. Both parties were eager for the masterpiece to be commenced. The summer holidays were approaching, and it might have been foreseen that neither Mrs. MACKAY nor M. MEISSONIER could be expected to remain in Paris. But a few sittings were given, and then operations were suspended on the understanding that the work was to be resumed when Paris again became habitable. When everybody had returned to town Mrs. MACKAY wrote to the painter, in the most polite terms, offering to sit again. There was no reply, and a second letter was also unsuccessful in overcoming the artist's silence. There is nothing unreasonable in the supposition that in the interval M. MEISSONIER would have been able to paint the accessories in the picture, no matter whether they belonged to millinery, furniture, or jewellery, if the originals were left with him; but a portrait could hardly be completed from memory. It was somehow completed, and, to the surprise of Mr. MACKAY and his wife, figured among the works that represented M. MEISSONIER in the Triennial Exhibition of 1883. The portrait did not win applause from Parisian critics. The hands especially were not suggestive of elegance, and it was explained that as Mrs. MACKAY was unable to leave her hands with the other accessories which had been entrusted to the painter, he was compelled to utilise those belonging to a model. A similar plan was adopted by VANDYKE, but he was careful in his selection.

M. MEISSONIER is too great a man to care much for plebeian critics, and, so far as is known, he made no effort to improve the picture after it left the exhibition. One day Mr. MACKAY saw the so-called portrait of his wife arrive at his house, accompanied by a note which was signed "PETIT," requesting payment for it, the amount being 70,000 frs. Large as was the sum it was paid without demur, and Mr. MACKAY kept the transaction to himself, just as a business-man would who had made what he deemed a bad bargain. However, after three months had elapsed the story of the picture got abroad, and of course was much distorted in the relation. It was only on reading one of the journals that Mrs. MACKAY discovered how she was made the cause of a ferment in the art world. The affair gives opportunity to critics like M. DARGENTY—and there are a great many who coincide with his opinions—to dispute the supremacy of M. MEISSONIER. A visit to the Louvre is, it is said, enough to demonstrate that M. MEISSONIER is not on a level with artists such as METZU, TERBURG, JAN STEEN, VAN DER MEER, and others of the Dutch school. His style is said to be characterised by littleness, timidity, dryness, and other defects. M. DARGENTY'S criticism is so freely expressed that the judge and jury who tried the BELT case would be appalled if they read it, and nothing corresponding to it dare be attempted in an English journal. But it may be taken for granted that all the efforts of the critics will never induce M. MEISSONIER to abate his prices or diminish the value of his pictures whenever one finds its way to the Hôtel Drouot.

The position adopted by M. MEISSONIER suggests the relations which now subsist between painters and the public, and which are entirely modern. There was a time when a painter was bound to please his patrons in the same manner that a tailor had to please with a coat, and probably it would be nearer the truth to say that the law in the case of the artist was altogether on the patron's side. This is suggested by GAY'S fable, which once formed the subject of a picture by the late Mr. SOLOMON. A painter, we are told, took the greatest pains to produce good likenesses, and succeeded in doing so; but, in consequence of their accuracy, his pictures were left on his hands, and lay in dusty piles. In despair he set up busts of *Apollo* and *Venus* in his studio, and contrived to use them when he was supposed to be copying the faces of his patrons. Everybody was delighted, and the painter gained fame and fortune through his busts. The moral to be drawn is that people rarely care to appear on canvas as they are, but desire to be shown as endowed with imaginary gifts. Photography has done much towards making men and women be satisfied with accuracy, but there is a lurking belief that a painter's eye should be competent to discern beauties which cannot be reproduced by a lens. Whether M. MEISSONIER'S portrait was what is commonly called a good likeness or the reverse does not seem to be clearly stated; but it is almost incredible to hear that a painter who is so microscopic in his details should fail in accuracy when rendering a lady's face. On the other hand, it must be admitted that portraiture demands special qualities which are not necessarily possessed by every figure-painter; and although M. MEISSONIER has produced a pleasing head which is called *Charlemagne*, he might not succeed so well as M. BONNAT in representing M. GRÉVY.

But what is deserving of note is the acceptance of the work by Mr. MACKAY, although it was not considered satisfactory, and the doubt which has been expressed whether he could legally do otherwise. An artist in M. MEISSONIER'S position risks his reputation by a defective work, and therefore would hesitate before parting with one of that character. It may also be said that a painter is generally a better judge of the merits of a work than the critics, and why should it not be so in this case? At any rate Mr. MACKAY did not care to take his case into a French court, and to pay at once was probably the most economical course.

In England a case of the kind would hardly be decided in favour of the plaintiff, unless the artist's success in portraits was universally acknowledged, for so impalpable a quality as "artistic merit" is beyond the comprehension of a modern jurymen. But if it were a case in which an architect had prepared plans which did not meet the approval of the client, there could be no doubt about the verdict. It is almost impossible to imagine that in this country any architect's claim which resembled M. MEISSONIER'S could be upheld. Mr. MILLAIS might demand—and, if a jury

were in a liberal mood, obtain—a sum for a portrait that was in excess of his customary fee and far beyond the average price of other men. But, unless there was a special agreement, an architect Academician could hardly expect to be awarded for his plans more than  $2\frac{1}{2}$  per cent. on the estimated outlay. The late Mr. BURGESS, it is understood, was sometimes paid 15 per cent.; and the Institute schedule says that in the cases where the expenditure is mainly for skilled labour, and not for materials, the charge should be regulated by special conditions. It is to be feared, however, that unless an agreement in writing could be shown, the Courts would decline to recognise 15 or even 10 per cent. But there is nothing equitable in the arrangements by which an abnormal commission can be paid to a painter, while architects of all degrees of skill are remunerated at an uniform rate, which is altogether inadequate for all but the plainest class of work. Some years ago the painter's position as regards fees nearly corresponded with what the architect's is now; but the absence of restriction has enabled them to obtain very large fees, and the remarkable demand of M. MEISSONIER is but the latest example of freedom in dealing with patrons.

### PARIS NOTES.

THE "oldest inhabitant" fails to remember when the main thoroughfares of Paris were cut and blocked up to the extent they now are. The works in progress are of three kinds, and those being executed in the central part of the city alone furnish employment to nearly eight thousand men. In the Avenue de l'Opéra and on the main boulevards the macadam or granite paving is being taken up, and the new system of creosoted wood pavement laid on a bed of cement substituted for it. At the same time new water-mains are being laid down in the 1st and 2nd Arrondissements, and fire-hydrants established at fixed intervals. Finally, the roadways are cut up on all sides for the execution of a work that could no longer be delayed, viz. the substitution in the asphalt-paved streets of a thick bed of mortar and cement in place of the old lime *béton*. This operation alone will entail an outlay of close on two million francs.

The special Committee on Works of Art (*Comité des travaux d'art*), the appointment of which was announced in last week's *Architect*, has been constituted as follows:—President: M. A. Kaempfen, Director of Fine Arts. Members: MM. R. Ballue, Ph. Burty, G. Lafenestre, Ch. Yriarte, Inspectors of Fine Arts; A. Dayot, Assistant-Inspector; P. Mantz, ex-Director of Fine Arts; A. de Ronchaud, Director of National Museums; Poulin, Inspector of Public Buildings; and Etienne Arago, Conservator of the Luxembourg.

On Saturday last the Académie des Beaux-Arts proceeded to the election of a member, in the section of Architecture, in the place of M. Lesueur, deceased. The six candidates were presented by the examining committee in the following order:—MM. Diet, Daumet, André, Normand, Hénard, and Magne. At the third ballot M. André obtained the requisite absolute majority of votes cast, and was declared elected by 27 against 8 given to M. Daumet, and 1 to M. Diet. The new member gained the Grand Prix de Rome in 1847, is Inspector-General of State Buildings, an officer of the Légion d'Honneur, and has been professor at the School of Fine Arts for over twenty-eight years. He has designed many public buildings, his most notable work being the zoological section of the Natural History Museum.

The ruins of the old Palais de la Cour des Comptes appear doomed to stand indefinitely, silent witnesses to the internecine strife that brought them to their present state. A recent inspection has shown that what remains of the buildings cannot be utilised in any way. Thus the proposals put forth by the Union Centrale des Arts Décoratifs and the Société des Artistes Français respectively, to utilise the ruins in the construction of an art palace have to be abandoned as impracticable. Perhaps the Government will now decide upon taking the only step that appears feasible to bring about the removal of this unsightly memorial of civil war—or in other words, sell the ground for what it will fetch as building sites.

It is proposed to create, at a short distance from Paris, branches of all the great public schools in the capital. For that of the Collège Chaptal—the great commercial school of the city of Paris—several sites have been proposed, and, among others, the historic domain of Malmaison; but the school council have decided that the new buildings must be situated somewhere on the line of the Western Railway, for the convenience alike of the professors and pupils' families. Choice will probably be made of the Villeneuve l'Etang estate, near the Park of St.-Cloud, where a site for buildings covering a space of 2,000 mètres, and capable of accommodating 200 scholars, may be obtained.

A special meeting of the Société Libre des Artistes Français was held on Monday at the Café Hollandais, when over a hundred members attended. After a discussion lasting an hour and a half, it was decided that no programme should be submitted for acceptance to the candidates for the jury of this year's Salon. At the annual general meeting of the society, held during the previous week, a declaration to be subscribed by candidates, and couched in the following terms, had been adopted:—"The undersigned engage to combat with all their might the 1886 Triennial Exhibition, inasmuch as its opening is fixed for May 1 of that year, and will necessarily prevent the Association of French Artists from holding its yearly Salon under the conditions that were formally guaranteed by the State." This declaration has now been abandoned, and the previous vote cancelled. A further meeting will shortly be held to vote the preliminary list of candidates for the jury.

The Department of Public Instruction and Fine Arts is engaged in drawing up for submission to the President of the Republic, a general report on the present condition of the museums and historical buildings of France.

In the competition for the Labarre prize, the architectural jury at the School of Fine Arts have just awarded the first place to M. Risler, a pupil of M. André.

M. Wertheimer, the Viennese painter, who obtained the Medal of Honour at the Amsterdam Exhibition, seems ambitious of following in the footsteps of his fellow-subject, M. Munkacsy. His remarkable picture, *The Syren*, has just been placed on view in a room in the Rue Montmartre.

The Museum of Decorative Art at the Palais de l'Industrie was opened on Saturday, the 1st inst. The most noteworthy object in this year's collection is the monument designed by M. Coutan, the sculptor, for the historic tennis-court at Versailles. This work is better in its details than in general effect; the statuettes round the base of the column, that rises from the centre, are of exquisite workmanship, but must be approached very nearly in order to be appreciated. They are four in number, and represent Bailly, Sieyès, Mirabeau, and Lafayette. Artistic furniture is but feebly represented this year, the best exhibit under this head being a magnificent oak cabinet—German Renaissance of the sixteenth century—presented by M. Dollfus. The exhibits of old china and pottery are very fine. Among the chief collections in this section may be mentioned that of Comté Kleczkowski, an exceedingly rich one, occupying a considerable portion of one of the large rooms; M. Antonin Proust's interesting specimens of Bosnian pottery; the antique terra-cottas and vases lent by MM. Rollin and Feuarent; the choice examples of Sèvres work presented by the Minister of Public Instruction, and some beautiful Limousin porcelain executed by the pupils of the Limoges School of Decorative Art.

A novel feature of the exhibition is a collection of ladies' *coiffures*, all, or nearly all, of the eighteenth century. There are, moreover, many rare books, manuscripts and old illuminations, as well as a room set apart for decorative drawings, besides collections of fans, old Japanese carvings, mosaics, enamels, tapestries, artistic designs for wall-papers, ancient weapons, &c., &c.

The exhibition that is being organised by the Union Centrale des Arts Décoratifs, especially for artistic wood and stonework, will open on August 1 next. Applications from intending exhibitors must be sent in before May 31.

By decree of the Minister of Public Instruction and Fine Arts, M. Thomas, a member of the Académie des Beaux-Arts, has been appointed Professor of Sculpture and head of an *atelier* at the National School of Fine Arts, in place of M. Dumont, deceased.

Important works, which are estimated to cost 15,000,000 frs., are about to be commenced on the Saint-Denis Canal and the Villette Dock, which will thus be closed to navigation for some time. Both the canal and dock are to be deepened and the former widened in parts, in order that boats of much greater tonnage may enter the city.

### GLASGOW INSTITUTE OF ARCHITECTS.

THE annual dinner of the Glasgow Institute took place in the St. Enoch Hotel, on Friday, in last week. Mr. James Thomson, F.R.I.B.A., president, was chairman, and Mr. David Thomson, F.R.I.B.A., vice-president, croupier. Among the guests present were Mr. Arthur Cates and Mr. J. Macvicar Anderson. The President, in proposing the toast of the evening, "The Glasgow Institute of Architects," said:—"We have been having prominently before us of late a book called 'Progress and Poverty,' but I think I may safely say that so far as general business connected with our profession is concerned the only progress we have made has been towards poverty; for, alas! the crisis of 1878 still leaves its dregs behind, and the consequence has been a very decided lull in all building and improvements. But your council has not been idle; it has had various matters before it. The consideration of the Health Bill and the Building Act has led me to look somewhat into those matters now so prominently before the public, and well known to the country as the 'Housing of the Poor' and the 'Bitter Cry of Outcast London.' The poor we shall have with us always, and I think no one knows that fact better than the Glasgow ratepayer. Since the machinery of the Improvement Act for the city of Glasgow in 1866 was set in motion, exposing the close, pestilential nests of misery and crime, the citizens saw additional evidence of the necessity for a change in the housing of the poor. But those who have known Glasgow for the last thirty or forty years, as I am sure the men did who urged on the Improvement Scheme, required no education from the modern speeches or pamphlets to show the horrible state of some of our lanes and closes in Glasgow; and I am not sure but much more strongly-coloured pictures could have been drawn of the horrible squalor, wretchedness, and crime in our Black Boy Close, Havannah, and the Fiddler's Close in High Street. Although the 'closes' I have named are now gone it is much to be feared that the evil is but partially removed—in many instances removed from one place to another, only to break out again with greater violence it may be on account of its being in a new place. These considerations have been forced upon us in connection with the new Building Act, for we all know that unless the people who are to inhabit the better kind of dwellings which we aim at for artisans and the poor are educated and made better, good and improved houses will be thrown away upon them. We know that the workman likes to have his house near his work; and it appears to be great nonsense talking about suburban cottages and cheap railway trains for the special accommodation of workmen to and from their work. The great difficulty, however, is not with the workmen, and the houses suitable for them; it is with those whose earnings are uncertain, and whose occupations are not to be found in the 'Directory.' Their rent payment is uncertain, but they must be housed. There are different grades of these also—one with fairly honest intentions, if these can be carried out; another with no intention at all but to prey upon his neighbour and steal. I would not like just now to draw out a plan and specification for the sort of home I should recommend for the 'abject poor' of Glasgow, but would leave the matter in your hands for due consideration. Whatever we may have to say of the quiet and gloom of the present time, we can fall back upon the time not long ago when property round about us rose in the market to an almost fabulous extent. I think it is now about time to lay our grumbling aside and look forward to what is to come. You will remember one notable instance in connection with the rise of property in our town which of itself is enough to rouse us up whenever it is named, and it has been often quoted—I mean Yorkhill, an estate of 104 acres, which was bought in 1823 for 19,000*l.* This property is not all realised yet, but 44 acres of it has already brought 220,000*l.*, so that a moderate calculation for the whole is given at 600,000*l.* This is but an instance of the rise in one locality in Glasgow, but it furnishes an illustration of the great progress which has been made, although some districts have not risen to the same extent, and I think I see the indication of a halt in the long-continued depression which will cause all who are interested to look about for the symptoms. At present we are working at the beginning of railways under our city, like London when it began its underground railway twenty-three years ago; and who knows where it may stop? At present the system which is being wrought

out is only from College Station to Stobcross Station, but when that is finished I think the necessity will be seen for more lines and junctions. This probable increase of work and provision for future work around us brings me to a point of our history which is very peculiar. It is exactly fifty years since Telford, the engineer, erected Glasgow Bridge. At that time the city was very different in dimensions from what it is now, and, remember, the growth has not been confined to one point, but has spread and increased until on the north side of the city it has touched Partick and Tollcross, and on the south side of the river it has extended itself from Govan to Rutherglen. Yet Broomielaw remains where it was fifty years ago, and while the harbour has been extended miles down the Clyde, the Glasgow Bridge, at the Broomielaw, is the westmost bridge still. It is extraordinary to think that, with all the development of Glasgow, this has been overlooked. That Jamaica Street Bridge has been greatly overworked and overloaded has been evident for many years. So much has this been the case, that it has sometimes been compared to London Bridge in respect of the enormous traffic which passes constantly over it. The relief so needed has been long talked of, and a glance at the map will show at once how matters stand. The Finnieston district is one which has been largely developed, and has been fixed upon as the one which the business part of the community seem to think is the right place for new cross-river communication; and certainly there is good reason for such a decision. Notwithstanding the fact of this means of communication being so necessary so far west, and, if executed, may be quite sufficient there, I have such an idea of the necessity of more immediate relief to our Jamaica Street Bridge that we ought to have a permanent way, in addition to the swing bridge, across the river for our general traffic further up, and nearer to the centre of the town. Were the swing bridge at Finnieston built and opened for traffic to-morrow, I believe there would not be the requisite relief to the Broomielaw Bridge, and the necessity for another crossing nearer the town would be forced upon the community.

### THE CHURCH AT KNIGHTON-ON-TEME.

THE following description of the church at Knighton-on-Teme is by Mr. Wright Wilson, of Birmingham:—

Accompanied by two friends of kindred tastes, I lately visited the secluded little hamlet of Knighton-on-Teme, having been incited thereto by an enthusiastic description, given to me by an artist friend, of its deserted little Norman church. Having derived much gratification from my visit, I am anxious to direct the attention of artists, antiquaries, or lovers of rural scenery to the many attractions of the place.

From Newnham Bridge Station, Knighton lies about a mile to the north-west. Ascending by the road at the back of the station, the summit of a hill is soon reached, from which an extensive and beautiful view is obtained of the Teme valley, with grand blue-hills to the south-west. A few yards further on, a field gate presents itself on the left, which admits to an unenclosed road at the top of a steep descent, with high banks on each side, between which appear, on the rising ground on the opposite side of the valley, a cluster of buildings half-hidden by trees, and among them the grey shingles of the weathercock of the wooden tower of the church can just be distinguished. Descending the hill the lane passes through an orchard, crosses the little brook which runs along the bottom of the valley, and ascends the opposite bank. The church is now just before you, but on arriving at the churchyard I would advise the visitor to resist the impulse to climb the bank and get over the rails, and to pass along the cartway winding round to the south-east side of the slight mound on which the church is built, to the yard gate, as from this side the building is seen to the greatest advantage. From this point of view will be seen a small and extremely simple chapel, without aisles or transepts, but with an unusual extension of the walls of the nave westward, from within which rises a remarkable wooden tower, the spaces between the tower and the outer walls covered by lean-to roofs hipped at the north-west and south-west angles. This tower, with its silvery-grey, time-worn oak boarding, rude contrivances for emitting the sound of the bells, its pyramidal roof and slender oak pinnacles at the corners, is the most striking feature in the scene, and is charmingly picturesque and beautiful in colour. Next will be noted the Norman features of the church, the flat buttresses, and the remarkable south doorway with blank arcade over it—a feature to be found in several of the small churches of the district. The doorway is of unusually lofty proportions; it has angle shafts in the jambs with rude capitals, and an arch with cabled or twisted mouldings, and a broad band of diaper on the outer rim. The door itself retains the old band hinges with ornamental ends, which are probably of the same age as the stonework. In the eastern jamb an aperture has been rudely cut, partly through the shaft, probably to admit a stoup for holy water, which has since been removed. The arcade over the door is of four arches on detached columns, enriched with twisted, reticulated, and chevron ornaments. Placed against this doorway is an oaken porch of the fifteenth century, of very good design and proportions,

with carved spandrels. This porch cuts rather awkwardly across the columns of the arcade, but adds very much to the picturesque effect of this side, which without it would be rather flat, and wanting in shadow.

Passing to a closer examination of the exterior, it will be found that the walls stand on a bold moulded base, which is distinctively Norman, though there are reasons for supposing that when the western extension was built the old base mouldings from the western wall were reused, and the deficiency supplied with new, imitated from the old; but we had not time enough to examine the walls with the minuteness necessary before speaking with confidence on this question.

Of the chancel, the south wall was rebuilt from the base mouldings in the sixteenth century or later, and the eastern end in a barbarous way in the nineteenth. The north wall is original, and the jambs of a Norman window now walled up may be discerned from the interior. In the north wall of the nave there is a door opposite to that on the south, and a very narrow lancet window of the thirteenth century. There is also, close to the eastern end, a window of the fourteenth century of two lights with geometrical tracery, in the head of which are some interesting fragments of stained glass. There is a similar window on the south side opposite to it, and another of two lights with a square head west of the porch. Passing into the church we find a fine chancel arch of the Norman period, with enriched mouldings and shafted jambs. On each side of the arch is a blind arcade of two arches within an enclosing arch, with columns and rude capitals.

The roof is a fine specimen, probably of the fifteenth century, with moulded tie beams and principals, and curved ribs. Additional importance has been given to the western bay by boarding the rafters and forming a ceiling half-way up, the spaces being divided into panels by mouldings with bosses at the intersections. The feet of the principals rest on corbels carved with devices, some of which might have been intended as punning rebuses.

The seats are of a mean character, of deal, and the pulpit a gigantic three-decker of the same material, with a sound-board.

At the west end is a gallery, and the nave is here divided from the tower by an oak framed and plastered partition. West of the partition the huge oak supports and braces of the tower and bell cage are seen; two western lancets light this space, and I think it probable that these were taken out of the western wall of the church, and re-inserted when this part was added. There are three bells, one of considerable weight.

The chancel does not retain anything of much interest; there are slight indications of early painted decoration on the north wall. The sanctuary rail is of oak, with turned balusters, and not bad in its way.

There are no monumental remains of importance, the pavement of the chancel consists principally of grave stones to two or three local families, but none are older than the eighteenth century.

The church is in a dilapidated condition, and unless something is shortly done to keep out the rain it will soon be a ruin. The wet now comes through the roof in many places, and the tower is half uncovered, admitting the rain to the oak framing of the tower and bell cages. The walls are 3 feet in thickness, but, as was generally the case, were badly built, and have stood their seven hundred years in spite of, rather than because of, the way in which they were constructed. The facings of the exterior and interior are hardly bonded together at all, and considerable spaces in the middle of the walls are filled with clay. This, soaked with rain, has split the walls in several places, and will shortly destroy the whole if the very moderate sum that it would cost to repair the roofs cannot be found. I can hardly believe it possible that this will be withheld by the inhabitants of the well-kept and comfortable residences we saw in the neighbourhood; but it is a lamentable fact that the inhabitants of country towns and villages seldom appreciate in their old churches any of the qualities which give them their chief value in the eyes of others. Picturesqueness, unpretending simplicity, beauty of colour, the softening and harmonising effects of time, and the venerable associations which should especially endear them to the families who have long been settled in the district, go for nothing, and even the clergyman is seldom found who can be got to acknowledge any sympathy with these things, which are all willingly and joyfully sacrificed to the desire to have a smart, bright looking church, with staring and harsh colour, red and raw tile pavements, and "store" fittings selected from a trade catalogue. What are the historical associations and the effects produced by the mellowing hand of time for seven centuries when put in the scale with these?

The Norman font, hallowed by its office as one would imagine, is, in a neighbouring village to Knighton, mutilated, and lies turned upside down in the churchyard to make way for a new one.

Let us hope that in the work that may be done at Knighton one shall hear nothing of "thorough restoration," as it is generally understood. It were better that the church should become a ruin. Judicious repair is all that is necessary; the exterior faces of the wall need not be touched, nor should any of the masonry be even cleaned, or the charm of colour would be lost.

But while avoiding the destructive process called restoration, a

judicious repair may be safely effected, and is absolutely required. The roofs should be carefully examined, strengthened if necessary, and the coverings made watertight; and although it will be a difficult and delicate operation, the splitting of the masonry of the south doorway and the chancel arch may be arrested, and to some extent repaired. The exterior faces of the walls should be left as they are. The stained plaster, with brown masonry peeping through here and there; the warm broken colour of the tiled roof, and the soft grey of the tower, are charmingly harmonious and beautiful, and may remain to be a source of pleasure to many future generations of wanderers among these softly-rounded Shropshire hills, if a little money can be found, and a jealous care exercised in the way in which it is applied.

## SOME NINETEENTH-CENTURY ARCHITECTS.\*

By PROFESSOR T. ROGER SMITH.

(Continued from page 148.)

*Arthur Ashpitel.*

ARTHUR ASHPITEL, affectionately known for many years and in many circles as dear old Ashpitel, was a remarkable man. Concealed under the exterior of a sturdy, unimpressible-looking, John-Bullish Englishman—conspicuous, however, for those never-failing tokens of something good behind, a bright eye and a massive head—lay a warm heart, a kindly nature, an elegant fancy, true wit, classic learning, and the power of a natural but not an untaught musician. In easy circumstances, and taking an interest in many things, Ashpitel did not push his practice with keenness, and did not, in fact, build much; but he had a wonderful knowledge of all matters connected with materials, construction, the history of architecture, and the literature of all the arts; and his contributions to the early numbers of the Dictionary of the Architectural Publication Society, each of which goes far towards exhausting the subject on which it treats, are good witnesses to his attainments and his thoroughness. Ashpitel was the most delightful of companions and one of the most sociable of men, so that it was sometimes hard to understand when he made the time to be alone and do his work. But he did perform a great deal of that sort of work which is of essential service to the members of a liberal profession.

*Sir James Pennethorne.*

Sir James Pennethorne, who held for many years the appointment of architect to Her Majesty's Commissioners of Woods and Forests, was a remarkable man, little known outside London, but much employed in the metropolis. He began his career under Mr. Nash, the architect of the Brighton Pavilion (built in "Mr. Nash's positive order"), a man whose talents for street improvement erected Regent Street, Carlton House Terrace, and the Regent's Park. Pennethorne was employed to form New Oxford Street, Battersea Park, and Victoria Park, and he was the architect of several very good public buildings, such as the Museum of Practical Geology, the buildings of London University (behind Burlington House), the Record Office, the extension of Somerset House, and the Queen's ball-room at Buckingham Palace. He was a most painstaking and fastidious worker, grudging no trouble to improve and perfect his designs, and frequently recasting them. Like many other architects, Pennethorne's best design was never executed; it was for the Government Offices since built by Scott, and was one of several made by him for the Government before the competition took place. Had it been adopted, we should have to-day a far finer structure than the one actually built. Pennethorne did not mix much with his brother architects, and fancied himself unpopular, but he was the subject of a demonstration of respect which no other member of our profession, so far as I am aware, has received; for when his difficult and excellent work in the enlargement of Somerset House was completed, the architects of London subscribed, and had a gold medal struck and presented to him to testify their admiration of his work.

*Mr. Walters.*

Other architects of the Classic and Renaissance school were Walters, Thomson of Glasgow, Edward Barry, and F. P. Cockerell. Walters, who practised in Manchester, was a man of real genius, and has left his mark on the buildings of the great city where his chief work was done; but, if I mistake not, specimens of his skill are to be seen as far afield as Constantinople. His most considerable work was the Free Trade Hall, a building with an original but rather heavy exterior, and a fine interior, very cleverly arranged as an auditorium, and very successful. More original were the warehouses which he designed and erected, at a time when warehouses with an architectural exterior were all but unknown in Manchester; and so well did he grasp the conditions of the problem, that in all probability a sound judge of architecture examining the whole of the fine piles of such buildings now to be found in Manchester critically, would select Walters's as the best

\* A Paper read at a meeting of the Leeds Society of Architects.

The only other works of his that I am familiar with are the elegant stations which he erected for the directors of the Midland Railway on part of their line between Derby and Manchester. These are simple and unpretending, and at the same time each one of them is unmistakably an architectural work.

*"Greek" Thomson.*

"Greek" Thomson, as the eminent Glasgow architect was sometimes called, was a man whom I only had the opportunity to know through his works and by corresponding with him, but his buildings are so remarkable that his name seems to call for mention. He believed in the superiority of Greek architecture to every other style; he held the faith that a Greek Renaissance was as practicable as the Roman Renaissance with which we are all familiar, and he devoted his life to a practical demonstration of the soundness of this belief, for he erected in an Anglo-Greek style a large number of important buildings, the bulk of which are in Glasgow; and he suffered, I have been told, both from loss of commissions and from opposition, on account of his sturdy adherence to the lines he had laid down. He has, however, enriched Glasgow with some public buildings of the most delicate refinement, joined to vigour and originality. No one can pretend that his works are not thoroughly modern; no one can for a moment hesitate to admit that the feeling which animates them is quite Greek. They differ widely from the *néo-Grec* of France, and yet in many points they recall it. Few architects or critics will admire the whole of them; some may not admire every part of any one of them, and yet few will fail to admit that they are works of genius, that they are eminently successful, and that they include Renaissance work as beautiful as any city in Europe can show.

*E. M. Barry and F. P. Cockerell.*

Edward Barry and Frederick Pepys Cockerell have been too recently among us for me to be willing to say much about them. There was something of resemblance in their circumstances. Each was the gifted son of an eminent father; each was a singularly cultivated man, as well as accomplished architect; both possessed in no common degree the rare gifts of a power of conversation which made them welcome wherever they came; and in both cases a brilliant career met with a tragic ending by a sudden and unexpected death. Cockerell did not secure much public work, but the galleries of one of the water-colour societies in Pall Mall East, and Freemasons' Hall, remain as sufficiently conspicuous and striking specimens of his skill; but he was much employed, and was very successful, in domestic work. He was one of the most accomplished draughtsmen of his time, and was a gallant, high-spirited gentleman—and as much artist as gentleman. Cockerell will have been known to many here as having filled the post of honorary secretary of the Institute of Architects. By many of his colleagues, and many artists of all kinds, he was regretted as a beloved and trusted friend, singularly brilliant in society, of the finest and most generous temper, and capable of doing the noblest acts in the most simple, unobtrusive manner possible. Few men, in short, have been such a loss to us as he.

Edward Barry worked with his father during the closing years of his life, and after his death completed his Halifax Town Hall and some of his works at Westminster. Energetic and able, he sought and secured a fair share of public work, and his magnificent design for remodelling the National Gallery, which was successful in competition, but a mere fragment of which was carried out, will be remembered by many. He rebuilt Covent Garden Opera House, and added the Floral Hall, and built the Cannon Street and Charing Cross Hotels. Barry, in his domestic work, introduced the beautiful Renaissance of France, of the time of Francis I., and carried out several very successful country houses in it. He adopted the same style for his buildings belonging to the Temple, erected on the Thames Embankment. Here, however, he pushed ornament too far, and this can hardly be called one of his successful designs. Barry underwent a severe disappointment in connection with the Law Courts competition. The judges originally recommended that he and Street should be jointly employed, and after seeing this great prize within his reach he had to reconcile himself as best he could to the work being placed entirely in the hands of Mr. Street.

Edward Barry for some time held the position of Professor of Architecture at the Royal Academy, and his excellent lectures there delivered, and republished in a volume, remain as a memorial of him. His removal in the prime of life was a misfortune for our profession, and cut short a career which already had been crowned with brilliant success, and bid fair to be a prosperous and distinguished one had it been more prolonged.

*The Gothic Revivalists.*

The association of ideas, and the chances of personal acquaintance or friendship, have led almost unavoidably to the grouping together of many more architects of the Classic school than of any other, so that space has not been left for adequate mention of the men who, after Pugin and Barry, carried on the Gothic revival. Happily not a few of them are still living and working among us, as is the great master of English prose whose pen so powerfully aided that revival; and in one or two other instances, as

for example in the case of that able and most distinguished artist Mr. Street, whom we have only very recently lost, various considerations would seem to make it a little difficult to include an adequate notice. Some other observer of men and things may, I hope, sketch for you the whole group complete. I can only undertake three members of it. Among those who should be noticed in such a paper would be some whose archaeological inquiries, following in the wake of Pugin and of that accurate and indefatigable pioneer, Mr. Rickman, extended, and we may almost say perfected our knowledge of the architecture of the Middle Ages in Great Britain. Foremost among these was the learned and acute Willis, who seemed to read an old building just as easily as the merchant can detect the state of trade from the city article of his newspaper and the price list of his stockbroker. Hope, Petit, the most rapid and clever sketcher of his time, Brandon, Hudson Turner, and the indefatigable Parker, were among those who laboured successfully in this field. Last, perhaps, but by no means least, among these was Edmund Sharpe, of Lancaster. His books are among the best, his "Parallels" probably the best, of the publications of this century that illustrate English Gothic architecture; and his spirited and repeated expeditions when, in connection with the Architectural Association, he conducted an excursion of architects and architectural students to fields of study in this country and in France, have established an extraordinary claim on our admiration and respect. Sharpe was full of enthusiasm, energy, and knowledge, and was as keen a student of his art down to the day of his death as at any period.

Blore and Salvin, Carpenter and Woodward, Raphael Brandon and Somers Clarke, and that genial and kindly pair, Talbot Bury and Benjamin Ferrey, both, I believe, pupils of Pugin, are among the architects whose names occur to us as active in the earlier and middle days of the Gothic revival, and whom it would have been pleasant to notice, but this paper must close with a few words on Gilbert Scott, George Edmund Street, and William Burges.

*Sir Gilbert Scott.*

There are few names, if any, which I should wish to mention with more emphasis, and at the same time with more cordiality, than that of George Gilbert Scott. The man and his work filled a conspicuous place among the architects, and in the architecture, of the nineteenth century. The story of his life, told with a frankness that is at times startling, is readily accessible, and need not be here related, except in the shape of a very bald summary.

Scott was a man of immense application and perseverance, and his power of concentrating his efforts on the object before him, and of continuing them till that object was attained, was remarkable. His first successes, when in partnership with Moffatt, were won in competition. A large number of union workhouses were to be built under the new Poor Law, and Scott and Moffatt embraced every opportunity of competing for these, and had an extraordinary run of success. During this time he used to work with wonderful energy, late and early, and sometimes all night through; and he obtained a good deal of enthusiastic help from men who, like himself, were students of Gothic architecture, with the hope of practising it. This hope in Scott's case, at any rate, was abundantly realised, in the many churches he built and restored, and in his cathedral restorations. Some, at any rate, of his first churches were Early English of a severe type, like the one at Ambleside, and inclined to be heavy. Later he seemed to prefer late Early English or Decorated, and his work was a little tinged with Continental Gothic, though this appears much more in his secular buildings than in his churches.

The pressure of work was for some time such as to task the energies of the most active of men, even with the aid of a large and highly-trained staff, and some amusing stories were circulated about the results of such high-pressure work; but I believe that all which could be done by untiring diligence and rapid despatch to keep himself personally abreast of his work was done. I once, in the height of his busiest time, called on him to borrow the drawings of a public fountain which he was erecting in India. Scott was out, and the drawings were not forthcoming, but one of his staff offered the loan of Mr. Scott's sketch. This, when produced, turned out to be a sheet of double elephant paper, on which the plan, section and elevation were all drawn to quarter scale roughly, but with fair accuracy, and in full detail; and in addition sketches of the profiles of every moulding, and an idea of the character of the carving in capitals and other enrichments were added. In fact, every inch of this comparatively modest work was there designed, ready to be translated by a draughtsman into working drawings.

Scott had an intimate knowledge of the architecture of every part of England down to the peculiarities of individual churches; and with all building materials and modes of construction he was thoroughly conversant, as he was with every part of the history and features of Gothic architecture. His largeness of knowledge, his experience, and his great reputation, which was a tower of strength on which restoration committees and cathedral chapters could rely, caused him to be selected, and rendered him perhaps the fittest man to deal with difficulties in our cathedrals and abbey churches; and, however disappointing the employment of a stranger may have been to individuals who had strong claims in respect of individual fabrics, it was, on the whole, a happy circum-

stance that at the moment when nearly every cathedral in England was being repaired, there should be an architect of sufficient standing to command general confidence, and whose position entitled him to ask (and enabled him to obtain) funds large enough adequately to carry out the restorations he undertook; and who, when these works were entrusted to him, found skilled and experienced clerks of works who were good antiquaries themselves, and carried them out with, I believe, as little damage to the architecture, and as much sound construction and faithful restoration as was possible. This cathedral restoration practice was no doubt Scott's most important work, and it was work, so far as I am able to judge, which he did extremely well, far better, for example, than it had been done by an architect and antiquary of European reputation across the channel.

To see or hear Scott at his best, it was necessary to see him at Westminster Abbey. I well remember on the occasion of the first visit paid by the Architectural Association to the Abbey, the pains he took to see that the preliminaries were all in order; and when, at his request, the President and I called on him the day before the proposed visit, he startled us by saying: "I think we had better go down to the building and lay out the route." He then and there left everything else, walked down with us to the Abbey, summoned the clerk of works, and went through almost every portion of the building with us, so as to make sure that we understood the way in which the party would be led. He met us the following afternoon, and for about four hours led our party up and down and in and out; and when at last the endurance of some began to flag, it was not Scott, but the students who showed signs of fatigue.

The descriptions he would give on these occasions were admirable and were well delivered, for he would halt at a point of interest, wait till the party had clustered round him; and then with distinctness, and in a loud voice, different from the rather hurried utterance of his ordinary conversation, he would indicate what he wished us to look at, and pour forth from stores of knowledge which seemed inexhaustible, a flood of explanation, illustration, and criticism.

The best of many addresses on professional subjects which I have ever heard him deliver in public, were two papers read in the chapter-house of Westminster Abbey to parties of architects, on occasion of visits paid by the Conference of Architects. In 1876 he addressed us on the ancient examples of English architecture to be found in London. On another occasion he spoke on the varieties of vaulting to be found in the Abbey, and pointed out that, with one exception, every phase of vaulting current in the country was to be met with there. Nothing could exceed the learning, the simplicity, the directness shown in these two papers, and they produced a very great impression.

Hardly less effective were his lectures to the students of the Royal Academy. Happily these have been published in two goodly volumes, and their great value can be recognised by all. As actually delivered, there was not quite the same sense of perfect ease due to being on his own territory and addressing none but his own profession, which struck one so in the addresses given at the Abbey or at the Institute: there was, however, the addition of a marvellous set of drawings of great size and splendid execution, some notion of which may be got by examining the illustrations reduced from them in the published volume.

Scott was always willing to engage in a competition for a work of importance, and he threw himself into such a struggle with the greatest ardour. The Government Offices' competition found him successful in obtaining a high position, though not the first, but ultimately the work was put into his hands. Hamburg Cathedral, Edinburgh Cathedral, the Albert Memorial, and the Midland Railway Terminus and Hotel are among his successes in competition. He tried hard for the Law Courts but failed, and he must have been engaged on very many others. I have a vivid recollection of calling on Scott, at his request, on the day when the competitive drawings for the Law Courts went in. The whole house in Spring Gardens was like a bee-hive with clerks drawing, painting, tinting, scratching out, and putting last touches; there were vans at the door, and men struggling with enormous strainers on the stairs and along the passages. In the midst of this busy turmoil, but in a room a shade less disturbed than the rest of the place, sat Scott, haggard, unshaven, and looking as if he and many others had been up all night, as I have no doubt had been the case. He was engaged writing his report, about a paragraph in which he wished to see me. While we were considering this, I well remember how Thomas Allom came in fresh, bright, and cheery, unwound himself from a long comforter, and promptly taking up a brush and his colour-box, proceeded to finish up one of the perspectives with its last finishing touches, with a leisurely ease that formed a strange contrast to the hurry and pressure all round.

Sir Gilbert was a tall, well-built man, slightly inclined to be bald, of a fair complexion, with light hair. He had fine features, especially a well-cut mouth and chin, and a lofty, well-shaped head, with a high brow. His bright eye could light up with readiness. His manner was simple and unaffected; but there was at times a kind of hesitation about his address which was far, I believe, from being a true index of character.

Scott was buried in Westminster Abbey, as Barry had been before him, and Street was at a later and very recent date.

It is not so easy to form a just estimate of Scott's work now as it will be a generation hence. No doubt much of his ordinary church work suffered from hasty design and from being too much the work of his assistants; but his best churches, as for example the one built by him at Edensor, and Doncaster Church, are excellent. I have already said, or at least implied, that I consider the work he did in the restoration of our cathedrals his most important and in many respects his best work; and I have some reason to believe that he attached great importance to it himself. He had the good fortune to build two cathedrals, Hamburg and Edinburgh, but I have not had an opportunity of seeing either. If, however, Edinburgh is equal to the drawings he exhibited of it, there can be no doubt that it ranks high as a piece of sound, well-designed modern Gothic work.

His secular buildings include several very prominent ones, and some smaller. Of the latter, a very elegant example exists in Leeds in the shape of a banking office. Glasgow University College, one of his largest piles of building, is certainly disappointing both in mass and in detail. His Foreign and Colonial Office, a Renaissance building, with many deficiencies in the eyes of a careful student of Italian architecture, has certainly the merit of a good deal of boldness in its principal front, and a simple plan.

The Midland Station and Hotel at St. Pancras seems to be the most successful of his secular works with which I am acquainted. The richness of many of its features and the boldness of the skyline make it one of the best modern buildings in London, and perhaps the best example of the application of Gothic to business purposes which has been carried out there on a large scale since the Houses of Parliament.

In the Albert Memorial Scott has left behind him a work on which he managed to secure the co-operation of a large number of the first artists of the day, and which probably no other architect could have so enriched. It has not been the custom to be enthusiastic in its praise; but it is not the custom to be enthusiastic about any sort of artists or their works, except actors and actresses. Probably this Memorial will be considered, in after times, Scott's greatest success, and one of the architectural achievements of the century; and certainly I should be disposed myself to give it that praise, and to claim for Scott the merit of having conquered very great difficulties and produced a very striking monument.

We must not omit his literary work. In addition to other writings, Scott has the merit of having produced two of the best architectural books of the century. His lectures (already alluded to), published just after his decease, are equal to any piece of architectural analysis by Willis, or Sharpe, or Viollet le Duc, and his "Memorials of Westminster Abbey," a volume in which he enlisted the aid of several first-class men, is the best account of an ancient monument which has yet been given us by any writer.

(To be continued.)

## THE WINDSOR TAPESTRY WORKS.

THE following letter has been addressed by H.R.H. Prince Leopold to the various town councils of the country:—

"Claremont, Esher, Feb. 21, 1884.

"Gentlemen—You are probably aware that about seven years ago some tapestry works were established at Old Windsor with the object of reviving an art which had practically been lost in England since the time of King Charles II. They were at first carried on by Mr. H. Henry, the present director, with my approval and support, but on his own responsibility. About three years ago the works were taken over by a committee of guarantors, whose names you will find annexed. The production of the Windsor looms gained distinction at the Irish Exhibition of 1878, and large orders have been executed from persons in England and America.

"It is now felt that, in order to carry out the object in view, and to establish thoroughly and permanently an art industry, which is at once a connecting link between painting and manufactures, in order to do this it is necessary that its aims should be widely known, and that it should be understood that not only are works of production and reproduction undertaken at Windsor, but at this institution the beautiful specimens of ancient tapestry which decorate so many of the great English houses, and which time and moth are ruining, may be perfectly repaired. Although much has been already done to extend its sphere of action, I now desire to appeal to those public bodies who have so warmly supported technical education.

"A number of English apprentices are being trained at the works, and have shown remarkable aptitude. Tapestries have at all times commanded the interest of the art-loving world, and are particularly suited for the decoration of the large halls which belong to the various Corporations, to whom I am now appealing for support.

"I should be pleased to have your views on this matter, and to call a private meeting to discuss the subject and talk over the means by which a permanent national institution could be established.—Believe me, yours faithfully, LEOPOLD."

## NOTES AND COMMENTS.

THE designs for the proposed War and Admiralty Offices will be examined by a committee of five members, consisting of Mr. CHILDERS, the Chancellor of the Exchequer; Mr. SHAW-LEFEVRE, the First Commissioner of Works; and Mr. W. H. SMITH, who was First Lord of the Admiralty in the late Government, as representatives of official experience; with Mr. P. C. HARDWICK and Mr. EWAN CHRISTIAN to represent architecture. One hundred and twenty-seven sets of designs will have to be considered; the number is less than was anticipated, but many competitors gave up the contest before their designs were completed. It may be assumed that twenty-seven plans at least will be set aside at once from want of merit or from non-compliance with the conditions, so that the examiners will not have to deal with more than a hundred designs. As ten of them will be selected to be made the basis of the second competition, the chances of a good design are much greater than in ordinary competitions. The constitution of the committee is to be approved. There can be no question about the fairness of the architectural members.

A GOOD many years have elapsed since it was first suggested in *The Architect* that an exhibition of the works of former students of the Schools of the Science and Art Department ought to be held, in order to demonstrate the worth of the Government system. At last the suggestion has been taken up by the authorities, and the regulations for the proposed exhibition will be found in another column. If all the students who now occupy good positions as designers and artists will send examples of their work, the exhibition must be a success. But it is not improbable that many men will hesitate to acknowledge their indebtedness to the Department schools, and on that account the first experiment may not be an adequate test of the influence of South Kensington.

THE Bill for the Sanitary Inspection of Dwelling-houses, which bears the names of Mr. MONCKTON, the Marquis of STAFFORD, Mr. DAVENPORT, and Mr. H. H. FOWLER, demands attention from architects, for, if passed, it will add to the inconveniences which arise to them from official and officious people. It is proposed to appoint sanitary inspectors, who are to have powers corresponding with those of the inspectors of nuisances. Plans and descriptions of every proposed building are to be submitted to the said inspectors, and must have their approval before the building is erected. The plans are to show clearly the position of the drains, soil-pipes, traps, closets, privies, refuse receptacles, cisterns, pipes and fittings, ventilators, and "all other sanitary appliances and things in any such building," a description which is sufficiently comprehensive to include a chimney-breast ventilator. The elaborate plans showing all those details are to become the property of the local authority, and are to be filed by them for future reference. The drawings are to be open to the inspection of the owners and tenants, and copies may be supplied on payment of a fee, which is to be fixed. During the erection of the building the sanitary inspector is to have power to inspect the works as often as he considers necessary, and on their completion the owner is to give notice, and the inspector is then to test all the drains, soil-pipes, and sanitary fittings, and, if he is satisfied, he is to grant a certificate, without which the building cannot be lawfully occupied. So much for new buildings; but it is proposed that once a year at least the sanitary inspector and his assistants are to make an inspection of all the "sanitary appliances and things" in all buildings in his district. If anything is considered defective it is to be forthwith remedied; and in case of refusal or delay, the local authority may do the work at the owner's or occupier's cost.

THE final clause in the Bill is likely to insure that it will never pass through Parliament, for it says that "the expenses of the inspectors, as well as the expenses of any alterations required to be made to place buildings of every description in a proper sanitary condition, including the expense of opening the drains and pipes for inspection, to be paid by the owners of the property." Everyone knows that inspection of any description under a local authority is an expensive luxury,

giving rise to controversies, and exciting indignation in rate-payers' associations. But when individuals are responsible for the cost there will be no check, and it is difficult to estimate to what sum the outlay under "dwelling-houses inspection" will mount. Defects exist in some houses, and it would be possible to remedy them without the machinery that is proposed in the Bill. In regard to plans, the scheme is absurd. At present it is difficult to find a reasonable town surveyor; but to have men of the inspector-of-nuisances type sitting in judgment on architects' designs would be to bring back the old days of DOGBERRY and VERGES.

THE appendix to the Report of the Historical Manuscripts Commission, which relates to the documents preserved at Carlisle, throws some light on the history of the Cathedral. In 1359 a complaint is made as to the condition of the choir of the Cathedral, and to this the existence of the clerestory and east end of the choir is probably due, a remission of forty days' penance being assigned to all who gave assistance either in money or in manual labour. The licenses granted year by year to *questors*, empowered to beg round the country for the funds required for repairing the Cathedral, show that the beautiful decorated windows of the choir were not put in but at the cost of money obtained with difficulty. According to the Report, the manuscripts belonging to the See are well cared for, and in good condition at the present day, but the modern date of most of the registers and documents proves that at some time, shortly before the beginning of the eighteenth century, a wholesale destruction must have taken place, which spared but few examples of an earlier period. Valuable contributions to comparatively recent parochial history may be collected from a great number of bundles, each labelled with the name of some parish in the diocese.

SOME English painters have a reputation in France, although it is rarely sufficient to gain them commissions, but they are few in number. Our neighbours do not necessarily esteem a picture because it was produced in England. This was evident from the low prices obtained for portraits of race-horses at the sale of the late Count LAGRANGE's property. Although there are enthusiastic members in the French Jockey Club who are more English than the English themselves, not one of them cared to give more than thirty shillings for one of Mr. HARRY HALL's paintings. The art of the English goldsmith was not more fortunate, for the big cups, with figures from history and romance and sprawling horses, did not realise a third of the value that was attached to them when they were put forward as prizes at race meetings.

Mr. POYNTER, when addressing the students of the National Art Training School, on Wednesday, spoke on the subject of industrial design. The method adopted for teaching design in the art schools, he maintained, was the right one; and the designs produced by the students were generally well adapted to the purposes for which they were intended. But it could not be denied that manufacturers did not make much use of the talent in the local art schools. Mr. POYNTER admitted that too much attention had been given to painting in the schools—but the cause was the high price which was to be obtained for pictures. The effect of the address will be that more attention will be given to industrial design. If, however, it is desired that manufacturers should be attracted to the schools, it will be necessary to adopt some plan by which designers of position will be connected with them. This would not be an impossibility in any of the great manufacturing towns.

IT may be well to remember that in cases of dilapidations, it is necessary for the defendant to make a legal tender of the amount named in his surveyor's valuation. In a case relating to a house in Portland Place where the owner claimed 111*l.*, and the defendant's surveyor's valuation of the dilapidations was 14*l.* 10*s.*, Master FRANCIS said that even if he agreed with the latter valuation he must award costs against the defendant, because there had been no legal tender of the sum. He suggested that as a compromise 26*l.* should be paid beyond what had been paid into Court, that each party pay their own costs of action and reference, and divide the cost of the certificate.

STANDARD INSURANCE CO.'S OFFICES, MANCHESTER.

THIS illustration shows the design for the new Insurance Offices which are to be erected in King Street, Manchester. A description will be given afterwards. The architects are Messrs. CLEGG, SON & KNOWLES, of Manchester.

STAINED GLASS IN DRAWING-ROOM, FINGARRY, STIRLINGSHIRE.

THE subjects illustrated, typical of out-door sports, occupy the seven upper lights of drawing-room oriel in Fingarry, a view of which we illustrated recently. Each panel is surrounded with a rich border of roundells, &c., and the effect, enhanced by the strong setting of mullions and transoms, is exceedingly good. These windows, with the other stained glass throughout the house, were designed and made by Mr. JOSEPH MILLER, St. Vincent Street, Glasgow, after sketches and suggestions by the architect, Mr. J. B. WILSON, A.R.I.B.A., Glasgow.

PARK HILL CONGREGATIONAL CHURCH, NOTTINGHAM.

THIS building has been recently erected by Messrs. G. BELL & SON, of Nottingham, the contractors, from the designs of Mr. TAIT, architect, of Leicester. The walling is of Loughborough red pressed brick. The masonry is externally of Mansfield stone, and internally of Ancaster stone. The cillings are of deal, and the other internal joinery of pitch pine, unvarnished. The transeptal portion of the church is not at present executed, but a commodious lecture-room and vestries are provided in the rear of the building. The heating is by Messrs. BACON & Co.'s high-pressure hot-water system. The ornamental glazing and gas-fittings have been executed by Messrs. WINFIELD & Co., of Birmingham, and the furniture by Messrs. JONES & WILLIS, of Birmingham.

DESIGN FOR CEMETERY CHAPEL AND LODGE.

THESE designs were prepared for competition by Mr. ARTHUR G. CROSS, architect, Hastings. The materials proposed to be used were, for the walls, either sandstone ashlar from Colton Hill, Hollington, or other approved Staffordshire quarry, or built in brickwork faced with Fareham bricks. The dressings in either case to be of Ancaster or Douling stone. Half-timber work is introduced in the upper portions of the buildings. To be roofed with Broseley tiles. Estimated cost, 600*l.*—chapel, 350*l.*, and lodge, 250*l.*

## ARTISTS' BENEVOLENT INSTITUTION.

THE annual general meeting of the members of the Artists' General Benevolent Institution, which was held in the rooms of the Arundel Society, was presided over by Mr. Marks, R.A. The members present were, in addition to the chairman, Messrs. P. C. Hardwick (treasurer), J. E. Millais, W. Gale, J. R. Clayton, A. W. Hunt, T. W. Woods (Christie, Manson & Co.), W. W. Fenn, R. Brandon, J. W. S. Woods, and R. Collinson. In submitting the annual report of the President and Council for the adoption of the meeting, the Chairman congratulated the subscribers upon the continued prosperity and usefulness of the Institution. For the past year the income amounted to 4,683*l.*, of which 2,579*l.* was subscribed at the annual dinner, when Sir Stafford Northcote presided. Mr. Fenn seconded the motion for the adoption of the report, which was passed unanimously. Other formal resolutions as to the re-election of President and committees and officers having been passed, the Treasurer intimated his belief that General Lord Wolseley would take the chair at the annual dinner of the Society, to be held in May, the exact date not having been fixed upon. Subsequently, in the same rooms, an annual general meeting of the members of the Artists' Orphan Fund, established some dozen years ago to provide aid for the education of the sons and daughters of deceased painters, sculptors, &c., was held. According to the report, which was approved in 1883, the income of the Fund amounted to 1,188*l.*, which had afforded assistance to fifty-eight orphans, some of whom had been partly, others wholly, maintained and educated. The proceedings closed with a cordial vote of thanks to the Chairman.

## THE PROPOSED CAVENDISH MEMORIAL.

ABOUT six months ago a meeting of the subscribers to the monument proposed to be erected to the memory of the late Lord Frederick Cavendish on the South Nab at Bolton, was held for the selection of a design for the memorial. A resolution was passed by the meeting approving of the design of Mr. Thomas Worthington (of the firm of Worthington & Elgood), F.R.I.B.A., of Manchester, and that gentleman was at once instructed to prepare working drawings and a specification, and to invite tenders for the execution of the work. This he proceeded to do. Some delays, however, were unavoidable, as examinations of the ground were required in order to ascertain how far materials could be obtained on the site, and it was only a few weeks ago that tenders were obtained. At the time the tenders were under the consideration of the committee a letter was received from the Duke of Devonshire, enclosing the following appeal addressed to His Grace by various gentlemen well known in art circles against the erection of the monument on the proposed site:—

TO HIS GRACE THE DUKE OF DEVONSHIRE, K.G.

We, the undersigned, desire most respectfully to lay before your Grace our urgent appeal against the proposal to erect a monument in the immediate neighbourhood of Bolton Abbey, in such a position as to form a prominent feature in the scenery of Wharfedale.

While we sympathise most heartily with the feelings of those who desire to obtain your Grace's consent to placing the monument in that spot, we beg leave to express our opinion that by giving that consent your Grace would allow the beauty of what is, perhaps, the most perfectly beautiful valley in all England to be most seriously injured. It would be troubling your Grace far too much if we were to set forth in detail the reasons of that opinion. We may suggest that where every line of hillside is exquisite in curvature and proportion, the introduction of a break such as would be caused by the erection of the proposed memorial would be painful to the eye, while the scale of both hillside and abbey would be injuriously affected. The poetical power of the whole scene would also, it seems to us, be destroyed by the intrusion of any other architectural work, even though it were noble in itself, and possessed of noble associations, into a valley where both eye and mind are so completely satisfied as with the Priory of Bolton.—We remain, &c., Walter H. Pollock, A. W. Hunt (member of the Royal Water-Colour Society), Edmund Gosse, W. T. Loftie, J. C. C. Ripon, C. E. Dawkins, and Thomas Oldham Barlow, R.A.

His Grace's letter stated his own opinion that the choice of the position for the memorial was regarded with marked disapproval by the artistic world generally, and the honorary secretaries, in a circular issued to the subscribers in the matter, observed that the committee "could not read it otherwise than as an expression of his wish that the scheme should not be carried out in the mode proposed by them."

In order to decide on the course to be adopted in the altered circumstances, a meeting of subscribers has been held at the Law Institute, Piccadilly, Bradford. Mr. W. Fison presided.

Mr. J. H. Wade, at the outset, detailed the reasons which led to the meeting being called, and read the letter and memorial above referred to, as well as letters of apology from a number of gentlemen unable to attend the meeting. One or two of the writers proposed that the funds raised should now be devoted to educational purposes. Mr. Wade added that some time ago, when the Duke's steward, Mr. Martin, called upon him with reference to the matter, he said that the family would prefer the monument to be in Bradford.

The Chairman remarked that he had frequently heard objections to the monument as proposed, on the ground that, whilst it was in every respect a fitting memorial, it, in a very sensible manner, perpetuated crime.

Alderman Holden stated that, at the request of the committee, his father, Mr. T. Shaw, M.P., and Mr. A. Illingworth, M.P., had had interviews with the Marquis of Hartington, Lord Edward Cavendish, and Lady Egerton in the matter, and he gathered that on the part of the family there was an objection to the monument being erected on the South Nab. The committee had an idea that this was the case, and he thought the Duke's letter confirmed it. The committee had met that morning, and he would now move the resolution they came to, which was "That the memorial take the form of a statue or monument in Bradford or neighbourhood." He afterwards urged that it was absolutely necessary that something should be done without further delay, as the funds raised were fast dwindling away. The 1,500*l.* originally subscribed had been reduced, by various expenses, to a little over 1,000*l.*, and unless some decisive steps were soon taken he was afraid that there would be nothing left.

The resolution was seconded, and a somewhat long discussion ensued, in the course of which an amendment was moved by Mr. Briggs, and seconded, "That the memorial be erected at Bolton or in the neighbourhood."

On being put, seven voted for the amendment and eleven against, and thereupon a second amendment was moved to the effect that the funds should be devoted to certain scholarships to be decided by the committee. This motion, however, was not seconded, and the original proposition was afterwards voted upon.

and carried. A second resolution which was adopted empowered the committee to carry out the decision previously arrived at in regard to the selection of a design for the memorial.

### THE GOTHIC REVIVAL.

ON Monday evening Mr. William Morris delivered, in the hall of the Birmingham and Midland Institute, the first of two lectures on "The Gothic Revival." He said that the intellectual revolt to which that name was given was at its inception and in its present stages connected very really with the general progress of the world—with those aspirations towards freedom from which, in truth, no sincere art could ever be dissociated. It was the very essence of the academic pedantry to which the Renaissance led as its natural degradation that it was ignorant of real history. For it history fell asleep sometime about the death of Nero, to awake in Italy in the days of the Kaiser Maximilian. All that had gone before the days of Pericles was a vague, ill-understood, and empty dream; all that took place after the first palmy days of the Roman Empire was but a confused jostling of barbarous interests not worth looking at or considering. But the intellectual revolt which he had to speak about was even in its first days founded on an appreciation of the value of history. That feeling grew as the revolt strengthened, until at last a new science arose—almost a new sense, one might say—and real, living history became possible to us. Before describing the results of the revolt, the lecturer rapidly reviewed the history of Gothic art, showing how it was influenced in the various countries where it spread, and announced that for his next lecture he would give his opinion of what the chances of Gothic art are for the future, and whether or not we may have to dread for the twentieth century a recurrence of that inane tyranny of the eighteenth which our own time had, at least, felt uneasy under. By art he meant not only the lesser or architectural arts, or those allied to industrialism, but also that side of literature which was born of phantasy and imagination. Of Gothic art fully developed, and untouched as yet by the spirit of the Renaissance, he said that, wrapping in its folds all Europe and a large part of Asia, it created such a body of beauty as the earth had not seen before or since. The very essence of its beauty was that it was founded on reason, and, above all other arts, was intelligent and free. If the industrial arts in the north of Europe were in a very rude condition at the beginning of that period, if the technique of some of the arts—pottery, for instance—was rude, there was nothing either coarse or careless about their artistic qualities. The fourteenth-century furniture did not reach our standard of comfort, but every piece was properly made and properly ornamented—that was to say, was beautiful. Contrast that state of things, and the naturalness and absence of effort which marked it, with the fact that in the present day one could get nothing beautiful without very distinct and decided effort, and not too much at that. Gothic art had, moreover, another characteristic—it was progressive, confident, and intolerant. If there was history in every atom of it, it was not conscious history, but only an exultation in the present and a hope for the future. Deep in its soul, at the same time, lay the melancholy and sentiment of the North, and there was no stint in it of rough but kindly humour. Such as this it lasted, with some gains in certain directions, but on the whole with more losses, till the end of the fifteenth century; but with the beginning of the sixteenth came the change. Not only that it grew coarser and more meagre, but that on the top of this coarser popular art was thrust another art, produced by men who had gained a little more knowledge than the naive workman of the fourteenth century, and with that had gained some feeling for history. At the head of the great impulse towards change which then revealed itself was a mass of talent and genius composed of the most gifted men the world had ever seen, the blossom of the centuries of free art which had gone before; and the fatal effect which the change had upon art was for a time hidden by their splendour. But when they passed away they left behind them a mere dead mass of academical whims and pretences—the so-called art which prided itself on being exclusive, narrow, and uninteresting. The decay was in the end manifest in painting and poetry, as well as in architecture. That strange force which, for lack of a better word, we poor mortals called civilisation, played us a scurvy trick certainly, till it landed us, at the end of the eighteenth century, stripped of all poetry, with history despised behind us, and nothing but a blank prospect of mere utilitarianism. Nevertheless out of this came the intellectual rebellion which he had ventured to call the Gothic revival. The stirring among the dry bones began from some inspiration of what must perhaps be called a science—an historical research, at all events, on the side of language. The philological scholars discovered the true relations of one tongue to another, and so began that great demonstration of the unity of mankind, which was still going on. In the course of the study they discovered also the literary merits of the non-classical poems and other literature, and learned very much of the history and social conditions of the earlier nations, so that even the earliest of our ancestors became visible to us as men of like passions with ourselves. It was clear that imaginative litera-

ture could not sit quietly by while historical research was providing her with so large a mass of material, and accordingly from this time poetry—to use the term in its largest sense—was born again, and the school of art, which for lack of a better word we were compelled to call the school of romantic writers, arose. The long-faded splendour of the Renaissance was now to be illuminated by flashes of genius, as strong and real as that of the time before the first day of that tyrannous Renaissance. What that revival turned out to be, what might yet come of it—whether it was the glimmer of real daylight or the false dawn of a cold moon—all this he should have to ask them to consider in his next lecture, which is to be on Monday next.

### LONDON HOUSES.

ON Monday Mr. R. W. Edis, F.S.A., concluded his series of Cantor Lectures on "Building of London Houses." Referring to furniture, Mr. Edis said a certain eclecticism must prevail in items of movable furniture, but the general scheme of decoration and fittings should form part of a harmonious whole. Having built our houses, we crammed them with heavy, useless, and inartistic things, which recalled the line, "In dark places of the palace stood uncertain shapes." It was true we had brought in a new order of things, but to him it seemed we were yet labouring somewhat in the dark with regard to the comfort and general sanitation of houses. We were apt to get furniture and fittings which, like ready-made clothes, were often misfits, and not inclined to consider the requirements of the various rooms. By this want of forethought there was much increase of expense which might have been avoided. For instance, window recesses which could be fitted with box seats were finished with panelled and moulded box, altogether unnecessary. Recesses in rooms were completed with mouldings and skirtings, instead of cupboards. Window shutters and fittings were often so arranged that when the blinds were put up the shutters would not open, and when cupboards were provided their tops formed dust-traps, which helped to make the room unhealthy. The question of planning furniture should form part of the original design of the architect. He was reminded that constructive furniture could not always be carried out, inasmuch as the fittings if fixed to the walls became more or less the property of the landlord; but he believed the incoming tenant would be glad to take them over at a fair valuation. Mr. Edis complained that builders do not adopt the innumerable small fittings which are the invention of Americans, adding that persons who had visited the exhibitions of building appliances would have noticed the various articles to which he referred. Finally, he maintained that all those shams and absurdities of false construction, which, like Tennyson's "Brook," went on for ever, might be remedied if the control of the work was entrusted to a master mind.

At the close of the lecture the chairman, Mr. B. Francis Cobb, announced that the Society of Arts had decided to offer prizes of 500*l.* and 100*l.* for essays on the rebuilding of London, on architectural and sanitary construction, and on the rehousing of the poor.

### THE HISTORY OF ART.\*

THE origin of any art or science is not so much owing to the particular accident which happened to the individual concerned in that origin, as to the intellectual adaptiveness of that individual to receive impressions from the particular circumstance which occurred. Thus, whether painting was first discovered by the lovely girl who, watching the shadow of her lover, traced it in the wall as a memento of their affection, or whether it originated with Philologes in Egypt, or Cleanthes in Corinth, or long before Greece was inhabited, the principle is the same. Without the inherent susceptibility of form in the girl the intellectual faculties would never have been excited to define figures. Aristotle ascribes the honour of being the first painter to Euehir, a relation of the famous Dædales who lived in the year 1218 before the birth of Christ; but whoever was the inventor there is no doubt that its appearance among the Greeks was in no better a dress than what served just to represent the bare shadow of the object, which was done by merely circumscribing the figure they had a mind to express with a single line only. Afterwards two men in Corinth began to add other lines to their figures, which gave them an appearance of roundness. This manner was called "graphic." But even the improvement on the original one-line manner was so inconsiderable that they found it necessary to write underneath every drawing what it was designed to represent. When the Spaniards landed in South America, the mode by which the natives conveyed intelligence of the arrival of their king was by painting the dress of the strangers and their ships. This certainly was a simple and obvious mode of thought and communication; but, independent of all theory, there cannot be a doubt of the

\* An address delivered by Mr. Andrew Blair, artist, at the first annual dinner of the Dunfermline Art Club.

extreme antiquity of painting. The walls of Babylon were painted with different kinds of animals, hunting expeditions, and combats. We find in Ezekiel viii. 18, "And I went in and saw and beheld every form of creeping things, abominable beasts, and idols of the house of Israel portrayed on the walls round about." And again in chap. xxiii., "She saw men portrayed upon the walls; the figure of the Chaldeans portrayed in vermillion." The course of civilisation probably descended from Ethiopia to Egypt, yet there is evidence of the existence of painting and sculpture in Egypt more than eighteen centuries before Christ; and at that time the arts were in the highest condition that the Egyptian school ever attained to. It is now certain that as early as the nineteenth century before Christ the walls and temples of Thebes were decorated with paintings and sculptures. After this period art became a mere tool in the hands of the priests, and degenerated into *facsimiles* of perverted forms of gods and goddesses. Not a single picture by these painters has reached us, and the only works of sculpture are three statues by Memnon at the entrance of the temple at Thebes. Cimon, the Athenian, was the first, it is said, who designed the figure in a variety of postures, distinguished the several parts by their joints, and was the first who took notice of the folds of drapery. In what century most of the old masters lived we have no account, but about the foundation of Rome in 1750 B.C. the Greeks had carried painting to a great reputation. Phidias, who painted *The Battle of Marathon*, lived in 442 B.C., was famous both for painting and sculpture, particularly the latter. His statue of Jupiter was considered one of the seven wonders of the world. Zeuxis was another of those men who flourished about this time. He was famed for being the greatest colourist of the ancients, though Pliny tells us there were but four colours in use—white, yellow, red, and black. His famous picture of *Helena*, which he painted for the people of Cortona, was considered his best. Being very rich, he never sold any of his pictures, but gave them to public societies and his friends. He is said to have died from a violent fit of laughter brought on by his looking at a picture of an old woman of his own drawing. I hope none of us will meet with the same fate. Between the time of Zeuxis and Apelles a great many geniuses lived, but Apelles was so far ahead of them that he was called the prince of painters. He was a native of Largos, and lived about 330 B.C. Alexander the Great strictly commanded that no other painter should draw his portrait, and he gave him for his wife the beautiful Campaspe, with whom he had fallen in love; and it was her he had for his model for the famous picture of *Venus Rising from the Sea*. From the days of Apelles to Turpessus, the last of the ancient masters, who lived in the year 69 of the Christian era, and who painted with his left hand, from his time till 1240 there were a great many famous as painters or sculptors, but their names have perished with their works. All those who practised the arts of painting and sculpture before the year 580 I have classed as ancient masters. At that time Latin ceased to be the common language of Italy; all the arts and sciences which in the two preceding centuries had been brought very low by the continued invasion of northern nations, expired with it; and in the reign of the Emperor they soon after lay buried together in one common grave in the ruins of the Roman Empire.

I come now to the modern masters. The first of which we have any mention is Giovanni, born at Florence in 1240. He learned the art of painting in Italy, and was the pupil of some poor painter sent by the Government of Florence from Greece, and whom he soon surpassed both in drawing and colouring. It is said he was but little acquainted with the rules of perspective; yet the foundation he laid for future improvement entitles him to the name of the father of the first age of modern painters. Some of his works yet remain in Florence. He was also an excellent architect, and died very rich in the 60th year of his age. I shall pass over a number of years from his death in 1300, until we come to Jan Van Eyck, born in a town on the river Maas in 1370. He it was who invented the art of painting in oil, in 1410, thirty years before John Guttenberg, of Strasburg, found out the art of printing. He died in 1441, at the age of seventy years. In our National Gallery in London there is one specimen of his work; and I have seen a great number of beautiful, highly-finished pictures by him in the Museum of Bruges, in which city he spent most of his days, and he is therefore called John of Bruges. The Belgian Government erected a fine statue to his memory in a square of that city, which is called by his name. In speaking about Bruges, this reminds me that, in St. John's Hospital in that city, there are a number of beautiful pictures by Memling—a painter whose pictures are scarcely to be seen anywhere else; I do not think there are more than four or five of his works in England. If any of you chance to be in that city, I would recommend you to go to St. John's Hospital, where you will get a rare treat in seeing the "Memlings." The Corporation have also erected a statue to his memory in one of the squares. There are also to be seen in that city some of the finest examples of Flemish architecture to be found in Belgium; some of the finest houses have not been inhabited since Philip of Spain over-ran the Netherlands, and William the Silent was the means of the rise of the Dutch Republic. We come now to the greatest master of the moderns—Michael Angelo—born near Florence in 1474. This great man,

born only one year after Leonardo, has the reputation of being the greatest painter, sculptor, and architect that ever lived. He was profoundly skilled in anatomy, was also an excellent poet, and greatly esteemed by several Popes, the Duke of Tuscany, by the Republic of Venice, Francis I., and by other great men of his day. He was invited to Turkey by Solyman to consult about a design he had of making a bridge across the Hellespont, from Constantinople to Pera. His greatest work is *The Last Judgment*, in the Sistine's Chapel at Rome. He was the architect of St. Peter's at Rome, and he died in 1564, in the 90th year of his age. What a galaxy of great men lived at this time—Albert Durer, Melancthon, Leo X., and others. Albert Durer was born in 1470. His principal works were painted at Prague, in the palace of the Emperor Maximilian. He was loved by every person for his agreeable temper and happy manner in all places but at home, where the penurious and sordid humours of a miserable shrew—his wife—shortened his life, and he died in 1528 at the age of fifty-seven. Titian, born at Cadore in 1477, is said to be the best colourist of the moderns. He was eminent as a historical, landscape, and portrait painter. Like the great English master of portrait painting—Sir Joshua Reynolds—Titian painted the portraits of most of the nobility of the country where he lived. He had a splendid constitution, and was never ill until the year 1576, when he died of the plague, at the age of ninety-nine years. Giorgione was born in the same year as Titian. Having studied under Leonardo, he soon excelled him in beauty and strength of colouring. His principal picture, *Christ leaving the Cross*, is now at Venice, where it is held in great esteem. He died very young of the plague (which he got from his mistress, who was infected), at the age of thirty-four. Raphael, of Urbino, born in 1483, was styled the divine Raphael, and he was so admired by most of the artists of his day that they were ambitious of working under him. He seldom went out without a crowd of artists and others attending him, purely out of respect. He was anxious to join the Church in hopes of a cardinal's cap, but, falling into a fever, he died at the age of thirty-seven. When we think of the great number of splendid works which he produced, and which are in existence at the present day, we are reminded of another great genius—our own countryman, Robert Burns—who died at the same age. When we think of these two great men, we are lost in wonder how they produced their works unless it was by inspiration. Raphael entered the Vatican at the age of twenty-five. What then must have been his diligence, his devotion, and his genius? Incessant application and incessant thinking weakened his delicate constitution, his devoted passion for Fornerina, and the endless demands on his brain, brought him to the grave—borne down like Burns by excitement of every description, both mental and physical. In a life of him, an attempt is made to prove that his death was caused by a cold brought on by his hurrying from his work to the palace at the Pope's order. Hayden says of him in connection with this:—"But this is no refutation of the previous causes; the question is, What prepared him to be killed by such a cause? Incessant work and dissipation? no man can do both. He was an extraordinary creature, modest, amiable, and affectionate. His death gave a shock to Rome which those only can estimate who know the depth of Italian sensibility. But did he die too young? Not at all. He might have decayed, or he might have become more luxurious or more neglectful. No man dies too young who dies with all the sympathies of the world unexhausted about him. He has no manner, no affectation, no grand style—all is simple, natural, and unaffected; in fact, he was a great Christian painter, and seemed born to extend the influence of Christianity by his art." His cartoons at South Kensington Museum are splendid works. I may mention that there is one of his pictures in Broomhall House, the residence of the Earl of Elgin. Quentin Matsys, the blacksmith of Antwerp, who became a painter through the force of love, and for the sake of a wife; I dare say you all know his history. Salvator Rosa, born in 1456—called Rosa from his red hair. He painted both landscapes and figure subjects. Holbein, born at Basle in 1498, famous for being the painter of *Death's Dance*, which is in the town-hall there. A number of his works are in Hampton Court Palace, he having been employed by Henry VIII.; he died in 1554 at the age of fifty-six. Not to linger too long, I must pass on to 1577, when Rubens was born. He was not only a great painter but a statesman. A number of his works are at Antwerp, the Luxembourg, Paris, and in England. A collection of pictures which he bought in Italy he sold to the Duke of Buckingham for 10,000*l*. Snyders was born two years after Rubens, and was famous for his hunting scenes. A magnificent example of this renowned master is also to be seen in the Earl of Elgin's collection. Vandyke was born at Antwerp in 1599. He came over to England after Rubens had left it, and was employed by Charles I., who sat for his portrait, and conferred the honour of knighthood upon him. He was small in stature, but very handsome. He married the Lady Mary Ruthven, daughter of the Earl of Gowrie. There are a number of his works in the Scottish National Gallery. He died in 1641, and was buried in St. Paul's Cathedral. My time will not permit of speaking about a number of great painters who lived after Vandyke, such as Claud of Lorraine, Poussin, and others; but I will go on to the year 1606, when Rembrandt was born near Leyden. He had a method of preparing his grounds peculiar to

himself in those days, that was by making his grounds parti-coloured, and with colours that came nearest to the life. Upon this he touched in the virgin tints as little disturbed by the pencil as possible, and with great masses of lights and shadows, gave great force and freshness to his subject. Rembrandt was a great humourist, dressed himself in an old-fashioned slovenly manner, and delighted in mixing with the lower orders of the people. His *Night Watch*—a copy of which you see on the walls here—hangs in a room of the museum in Amsterdam, along with Vanderhelst's *Banquet of the Civic Guard*. Both of these pictures are worth going a long way to see. The *Night Watch*, unlike the copy before us, is not black and dark in colour, and when I entered that small room and saw those two pictures, I was perfectly astonished at their brilliancy. When I am speaking about Rembrandt, I cannot help referring to another of the Dutch masters, Paul Potter, whose famous *Bull* is at the Hague. I confess that this picture disappointed me. It appeared to me to want strength, but this was perhaps owing to my having seen so many "Rembrandts" at the same time. Rembrandt died at the age of sixty-two. I shall now pass on, and conclude with the founder of the English School—Sir Joshua Reynolds. Although there were some painters of note in England before his day, such as Dobson, John Greenhill, and John Riley, these men have left no permanent mark of their existence as painters; it was reserved for the great master of portraiture to form the British School of Painting.

### THE BIRMINGHAM GAUGE.

A MEETING of sheet-ironmakers was held in Birmingham on February 28, in order to decide what gauge was to be adopted in their trade after March 1, when the new standard wire gauge came into operation. The chairman, Mr. B. Hingley, said he was in favour of adopting the gauge approved by the Committee in Wolverhampton, and formulated by Mr. Hatton at their request.

Mr. Hatton said they lived in an age when many matters of disorder were being reduced to system, and the Birmingham wire gauge was one of them. Many of them thought that the inch, which was a standard measure, might consistently be subdivided into tenths, hundredths, and thousandths, and that the thousandth part of an inch, which scientists called a "mil," or any number of them, might be so arranged that in like manner they would serve for describing the thickness of copper, brass, iron, steel, lead, and all other metals and things, and that a series of numbers, as in the old Birmingham wire gauge, rearranged upon a scientific principle, would suffice as one gauge for all purposes, instead of having several gauges for several purposes. But they were told by those placed high in authority in the country that the standard wire gauge authorised by an order in Council was for measuring wire only, and not for flat iron; and if they used that gauge for flat iron it would be by sufferance, and without authority. The difficulty they were thereby placed in was that they had no standard or authorised gauge for flat iron, and the Birmingham wire gauge in about thirty-four hours' time would be a myth. While in that dilemma their counsels had been divided, some saying "Let us have the Whitworth gauge;" others, "Let us embrace the standard wire gauge;" others again—the do-nothings—"Let us go on as we are." To go on as they were implied that each manufacturer for himself, as long as he was undisturbed, would continue to interpret, according to his own fancy, and utilise the so-called Birmingham wire gauge, but which inevitably would terminate, and at no remote period, unless some other standard was subsequently provided, in an absorption into the standard wire gauge. Then, to embrace the standard gauge meant a large amount of sacrifice. As far as sheet iron went, it meant that all sheets that were 035, and now 21 w.g., would have to be sold as No. 20 w.g.; that all sheets that were 022, and now No. 25 B.w.g., would have to be sold as No. 24 w.g.; that all sheets that were 016, and now No. 28 B.w.g., would have to be sold as No. 27, all of which would suffer a clear loss of all the difference in price between singles and doubles, doubles and lattens, and extra lattens. Hoops would be similarly, but much more prejudicially affected. All this evil would happen, unfortunately, at a time when the trade was most heavily burdened with depression, and when selling prices carried very meagre profit. To adopt the Whitworth gauge in lieu of the old Birmingham gauge doubtless would be to substitute a scientific arrangement for a rude scale which possessed little merit, and which had nothing to recommend it but its bare antiquity. The general application of the Whitworth gauge would be utterly subversive of the rules that hitherto guided them, and productive of great vexation. Another method was open to adoption, and it was one that would cause the least possible disturbance to existing practice and calculation. It would operate without loss of any kind, and might be as satisfactory in every way as anything else that could be designed. The method which he recommended was a symmetrical adjustment of the Birmingham gauge under the assumption of a new name—an adjustment that for its simplicity, harmlessness, and general familiar features must, he thought, commend itself to all intelligent

and unprejudiced minds. The standard gauge probably suited the wire trade, or a portion of it; but it was unsuitable to the trades they represented, and it was very important that they should obtain the sympathy of the Board of Trade, and, if possible, induce the Board to make the gauge they might ask for a standard. To go on long as they were, which was equal to a muddle, would be impossible. The standard wire gauge would be injurious to them. The Whitworth gauge would entail great and vexatious alteration, and consequently it would be necessary to fix on some other way out of the disorder, and to have their practice made legal. If a better gauge than his could be put before the meeting he would gladly support it.

After some discussion the meeting resolved to adopt Mr. Hatton's gauge, and to deposit a copy at the Board of Trade offices, in order that it might be made legal by an Order in Council. The following is the proposed gauge:—

Parts of Inch.	No. of Gauge.	Proposed Thickness.	Parts of Inch.	No. of Gauge.	Proposed Thickness.
1	15°	1'000	1/32	20	0'392

### EXHIBITION TO ILLUSTRATE THE OPERATIONS AND INFLUENCE OF SCHOOLS OF ART.

THE Committee of Council on Education consider that it will be of advantage to the art education of the country if an exhibition of works of art manufacture designed and executed by students of schools of art be held during the present year, in connection with and forming part of the International Exhibition at South Kensington. The works will consist of carvings in all materials, furniture, decorations, metal working of all kinds, jewellery, goldsmiths' work, pottery, glass, woven and printed fabrics, &c. All articles exhibited must be the work of past or present students of schools of art, or executed from designs by such students, the works themselves having been executed since the year 1862. The articles must be certified by the manufacturers, by the master of the school of art in which the student has received instruction, or by the student himself. The name of the manufacturer, of the school of art, and of the student will be published. The decision as to the acceptance of any work for exhibition will rest entirely with the Committee of Selection. The works must be sent to the Department on or before March 31. They must be addressed to the secretary, and accompanied by a note (written only on the first and third pages) describing them as they are meant to be inserted in the catalogue. The note should also state the names of the manufacturers, the designers, and the artisans; the names of the schools of art attended by any of them; and the periods for which they attended. The prices of each article may be given if it be desired. Every possible care will be taken of the works sent for exhibition, but the responsibility for loss or damage in transit and during the period of the exhibition will rest with the exhibitor.

Examples in the following sections will be eligible for admission:—Section 1. School studies in stages of instruction;

designs and models executed by the students in the schools. The latter will be placed with the section to which they belong. 2. Ceramic manufactures, porcelain, earthenware, stoneware, terra-cotta, &c. 3. Glass, cut, engraved, flashed, pressed, &c.; stained and painted glass in windows or panels. 4. Enamels on metal, cloisonné, champlevé, &c. 5. Ornamental metal-work—bronze, brass, iron, cast or wrought; drawings and photographs of such works as may have been executed. 6. Silver and gold plate, plated wares, electro deposits, including models for silver and gold work; drawings and photographs of such works as may have been executed. 7. Jewellery and personal ornaments—gold, silver, plated, or in any other suitable materials. 8. Furniture and wood carving, inlaid wood, parqueterie, papier mâché ware, &c. 9. Decorative carvings in stone or marble. 10. Lace—point, pillow, and machine-made lace; drawings and photographs of such as may have been executed. 11. Woven damasks in linen and cotton, plain or in colours. 12. Silks, ribbons, trimmings, &c., including furniture and dress fabrics. 13. Mixed woven fabrics for dresses, shawls, scarfs, &c. 14. Printed fabrics. 15. Carpets and tapestry, curtains, table-covers, &c. 16. Painted decorations, wall-papers, &c. 17. Lithographs, chromolithographs, &c. 18. Illuminations, illuminated addresses, title-pages of books, book-bindings, &c. 19. Etchings, engravings on wood, and drawings for engraving. 20. Painted photographs of objects of decorative art. 21. Architectural drawings, designs, and models of buildings. 22. Miscellaneous: articles not included in any of the above divisions, but yet coming within the object of this exhibition.

### THE LATE MR. C. J. LEA.

A WELL-KNOWN painter and decorator of Manchester has died somewhat suddenly, and has left a gap which will not easily be filled. The late Mr. Lea's place of business is in John Dalton Street—an old-established painter and paperhanger's shop known twenty years ago or so as Crowther's. Mr. Lea was no ordinary painter and decorator, no mere employer of hands, who found the capital and hired men to do all the work. He not only knew how the plainest, as well as the most elaborate, work of his trade should be done, with what materials, how they should be prepared, and how applied, but he could do every part of the work with his own hands. In the higher class of ornamentation and decorative work Mr. Lea was skilled. It was a treat to see him on the scaffold, first lightly sketching out symbol or ornament, fruit, flower, or foliage, and then with practised hand firmly, boldly, and quickly putting in the exact forms in permanent colours which were to be a delight for years to come to those who looked at them.

Mr. Lea's eye for harmony of colour was very good. He gave one the rich, warm, luxurious comfort that befits the drawing-room, the cheerful brightness of a bedroom, or the quiet dignity that one looks for in a church. The number of houses that Mr. Lea's taste and handiwork made graceful and comfortable in appearance, and of churches that he rendered seemly for divine worship, is very great. His talents procured him distinguished patronage. His work is to be found in the Duke of Westminster's Palace of Eaton, in the Manchester Town Hall, and in the Natural History Museum at South Kensington. Those architects who once availed themselves of his services were only too glad to secure his help in their after works. He cared about his work for the work's sake, and what was or could be hidden or concealed was as well and conscientiously done, as regards its quality, as work which must be done well because any defect would be certainly revealed. Mr. Lea was, moreover, a man of reading, culture, and refinement, a gentleman in the proper acceptance of the word, a man who was worth knowing for what there was in him. He was a good man too. Those near to him whom he leaves behind have no anguish to add to their sorrow for his loss. Modest and unpretending he was, but of a sort that we can ill afford to lose. We were all the better for what he was to and did for us, and none one whit the worse. Of how few can as much be said!

### TECHNICAL EDUCATION IN IRELAND.

A DEPUTATION of working-men a few days ago waited upon the Lord-Lieutenant to represent the desirability of the establishment of technical schools in Ireland. The deputation was introduced by the Lord Mayor. Mr. Dooney expressed a hope that if the movement proceeded the teaching would not be left altogether in the hands of professors. Mr. Simmons said he felt that if the Government did not assist them the industries of the country would die out. Mr. Mathers said the trades would prefer that the lectures should be delivered in their own halls rather than in public institutions. Alderman Dawson, M.P., said that the establishment of large factories and concerns had swept away the apprenticeship system, and they now wanted the technical training that was given under the old system. The Lord-Lieutenant,

in reply, complimented the working-men on the ability, and even eloquence, they had displayed in their speeches. Some people seemed to think that technical education should really teach the artisan in the school the whole of his trade or business. He did not think that was possible, but what he did think might be done, and was being done, was to give scientific knowledge that would give a certain degree of handiness to the householders which would enable them to apply that knowledge afterwards to their trade with intelligence and power. Everyone should have a knowledge of drawing and geometry, so as in after life to be able to express their ideas with their pencils. The National Board had made great efforts to teach practical agriculture to the boys in rural schools, and they had recently, first in Cork and then in Dublin, established schools to teach dairy work. A great deal also in the matter of needlework had been done. Unfortunately, as he was ready to admit, the Irish have not the same advantage as these in England, because there are not so many schools started here by individuals as in England. He would convey a report to his noble friend Lord Carlingford as to what had been said. With regard to the College of Science and the classes at Leinster House, he thought that the educational system at the College of Science should be extended so as to be available to working-men, and the same might possibly be done with the out lectures at Leinster House. He understood that the National Board were willing to open night classes in Marlborough Street Buildings for working-men, and he understood that they had adopted means of instructing teachers, who were sent through the country, in the use of tools, that they might afterwards impart their knowledge in this regard to the children under their care. He agreed as to the necessity of giving facilities for the proper education of workmen. Nothing will do more to remove discontent than that, and if they did that they should have, he sincerely trusted, a time of peace and content in Ireland. He hoped that this movement and others to raise again industries in this country would succeed, and he assured them that nothing would give him greater pleasure than that he should have had a humble share in forwarding that great work. The deputation then retired.

### MASONS' MARKS.

A MONTHLY meeting of the Newcastle Society of Antiquaries was held on February 27, when it was announced that Mr. Gibson, the castle attendant, had prepared a collection of masons' marks found on the exterior and interior walls of the castle. These he placed on the table.

Mr. Strangeways proposed that the collection should be published in the Transactions of the Society, and that a vote of thanks should be given to the curator for the great trouble he must have taken in the matter.

Mr. Hodges seconded the motion. He said that masons' marks first appeared at a very early point of the twelfth century. At that period they were engraved on the outer face of the stone. Subsequently they were put on the inside, but from the fourteenth century down to the last century they found them appearing on the face of the stone again. The same marks which occurred in the castle appeared in Hexham Abbey, the cathedrals of Carlisle and Durham, and many other buildings, showing that a band of free-masons went about from building to building, and that it was the custom of each man to put his mark on each stone he dressed.

Dr. Armstrong said that each mason was formerly paid according to his work, and each had his mark which he put on the stones he dressed. Any mason forging the mark of a brother mason was liable to death. These marks were found on all the old castles and old buildings throughout the kingdom. If they went to Lumley Castle they could see them by the dozen. In Warkworth Castle, and, indeed, in all the old castles, they would see them, and be able to trace one man's work throughout the whole building. If Canon Tristram was a member of the Society, he was one that could give them the best account of mark masonry. In his travels in the Holy Land Canon Tristram could trace stones intended for the Temple on the way from Joppa to Jerusalem. The stones were all dressed and prepared ready for fitting into the Temple before they left the quarries. Some of the stones met with accidents in the course of transit, and were broken; and these were still lying between Joppa and Jerusalem, with the masons' marks upon them. He suspected antiquaries would find that masons' marks were of a much earlier date than had been stated that night.

Mr. Holmes: And also at a later date. The masons have their marks now. The Chairman: I am afraid it cannot be said they mark the stones now. Mr. Holmes: When the contractor's agent comes round he sees the marks on the stones and measures them. The Chairman said it was very desirable that men should acknowledge their own work; for that would cause them to endeavour to do their work all the better in order to keep up their reputation. Mr. Holmes said that he had an idea that the masons' marks were simply either Runic or letters of the old alphabet. The mason's initial worked in probably with his master's. The motion was cordially carried.

#### The Presidency of the Institute.

SIR,—Many considerations point to the urgent necessity for a society of such high public character and importance as the Royal Institute of British Architects to have for its presiding officer a gentleman of the very first standing. Moreover, we are allowed to understand that the Council have unreservedly abandoned their claim to nominate a president in the way they have recently done. It would be an act of grace, therefore, if they were now to nominate some one who is expressly outside their own circle. There is one gentleman whom I venture to name as being particularly well entitled to the honour: I mean Mr. George Godwin. Not only has he served the profession (you, Mr. Editor, will know under what peculiar difficulties) as a high-class journalist for nearly forty years, but he has made for himself throughout the Empire, and, one may say, the world, a name universally known and held in honour. It may not be in bad taste if I hint further that he is a direct benefactor to the Institute to a large amount—I think the largest amount ever given to the Institute since its foundation. That he is a man of the widest experience of affairs, professional and otherwise, of generous feelings, excellent presence, perfect manners, it is needless to add. I regard it as highly creditable to the Government that he has been placed on the Royal Commission recently appointed in a very important cause with which he is familiar; and I think it would be equally creditable to the authorities of our profession if he were nominated—to be, I feel sure, elected with enthusiasm—as the next President of the Institute.

Yours, &c.,

AN OLD MEMBER OF COUNCIL.

#### The Institute Election.

SIR,—A circular has been sent out by the Council inviting members to "mention" four names for nomination on the house-list for the new Council. We have had no intimation of what this proceeding is intended for, and I am sure it is useless for private members to suppose that, without what was called in the debate on Mr. Ridge's motion a "cabal" or "conspiracy," it can be of any use at all. If the members in any number have a desire to take part really in the election, it can only be done by a preliminary meeting; and I would ask, Why cannot we be invited to meet in that way at the Institute rooms openly? It seems to be the general opinion that something ought to be done as regards future elections, and this is the only way in which it can be done, except by resorting to secrecy. I always thought it a pity that Mr. Street's election three years ago required the aid of private meetings and circulars, but I see that it could not be done in any other way, and, unless a meeting can be called now at the rooms of the Institute, there is no other way open to us for influencing the election as we are held entitled to do. The existing Council have it all their own way, for what I can see, to appoint through the house-list whom they please, if only they will vote for it solid, which they always seem to do. If the members are serious in wishing for new blood, they must do something more than they have done as yet. Somebody must also take the lead; and if two or three try it in different directions, all the better perhaps. We want to be stirred up a good deal more than we are, and I don't see that anyone can be hurt much, whatever happens.

Yours,

A MELANCHOLY FELLOW.

#### Buckfast Abbey.

SIR,—Outside the "charmed circle" of the council and officials of the Society of Antiquaries, no one could have imagined that Mr. Walters had seen Mr. Rowe's book before it was put into his hands by the Secretary, when he was endeavouring to describe his drawing and plans of Buckfast Abbey. They perhaps had more information than was vouchsafed to the Fellows, for they had in a fit of liberality granted a sum of money to continue the excavations. In justice to a painstaking antiquary and an old acquaintance I supplied what appeared to be an omission.

I am, yours &c.

J. TOM BURGESS, F.S.A.

Society of Antiquaries, London:  
March 6, 1884.

#### Re-Arbitrations.

SIR,—In the report of a case in the Court of Appeal—*Fraser v. Ehrensperger*—reported in the March number of the *Law Journal*, confirming the case of *Meier v. Rouse*, it appears to be now clear that without the words "this submission to be made a rule of Court" in the agreement to refer, either party may retire from the agreement at any moment up to the making of the award.

In other words, each party agrees to refer the dispute to arbitration so long as he and his opponent remain of the same mind—an arrangement which is very far from being businesslike. It would appear from this that the arbitration clause in building contracts, as at present drawn, is capable of being made abortive at the instance of either party.

As this is a matter of great importance, it occurred to me that it is not possible to give too great publicity to the decision.

I remain, Sir, yours faithfully,

157 Wool Exchange: HERBERT D. APPLETON, A.R.I.B.A.  
March 3, 1884.

#### Ventilation of Theatres.

SIR,—There are a great many opinions being expressed just at present in the form of papers read and letters to contemporaries, as to how to ventilate a theatre, but there seems to be such an opposition and general confusion of "ideas" upon the subject, that it is greatly to be feared but little good will come of the agitation. It would be a pity, however, that such a favourable opportunity should be allowed to pass for rectifying such a notorious evil as the bad ventilation and vile draughts which exist in almost every theatre.

We think now that attention has been drawn to it, advantage should be taken by theatrical managers of the system of ventilation which Mr. J. P. Seddon, in a paper recently read by him, so warmly recommends, and which he demonstrated to be so successful that by the simple application of it to a theatre in Manchester, the enterprising manager was enabled to retire shortly after with an ample fortune, all previous managers of this theatre having been ruined entirely through the defective ventilation.

We have to thank Mr. Seddon for his valuable advocacy of our system, and for so convincingly proving the efficiency and excellence of our air-pump ventilators, with which the theatre in question is ventilated, there being only two leading theatres in Manchester, the Prince's and the Queen's, both of which are ventilated with our system of ventilation. Should any other "manager" feel inclined to make his fortune, we can only assure him that the services of the same "genii" who so ably assisted the Manchester gentleman are at his disposal, and that success in every case is *guaranteed*. After an offer like this, we think no one will have a right to say that there is no system at present in existence with which a theatre can be efficiently ventilated, and by which the audience may enjoy a play with pleasure to the mind and comfort to the body.

We are, yours truly,

64 Holborn Viaduct:  
March 3.

ROBERT BOYLE & SON.

#### Stained Glass.

SIR,—Having read with great interest your article of this week upon "Glass Painting at the Royal Academy," I should like to avail myself of a small portion of your space to refer to one or two points.

I heartily approve your advocacy of the study and exposition, at the Royal Academy, of the arts of decoration and ornament. There is no branch of an architect's work, as I take it, which offers a more delightful or inexhaustible field for study than that of interior decoration, sadly neglected and woefully misunderstood as it seems to be by many, if not most, modern architects. It is difficult to understand how an architect who has built a church, let us say, or a house in a certain style, can contentedly hand over the decoration of by far the most important part of his work—the interior of the building—to the professional decorator. Yet we see this done every day, with what frequent result of unscholarly inconsistency and vulgar travesty of style your readers know only too well. Painful memories arise as one approaches this subject of Victorian versions of Grecian ornament mixed with strange arabesques, cribbed wholesale from the "Grammar of Ornament," or evolved—Heaven knows how!—from the mystic resources of "the trade," stencilled or painted on the walls and ceilings of rooms in the style of the Italian Renaissance, or, indeed, of any other, for the dictates of "the trade" are not as a rule modified by paltry considerations of style. How many of our beautiful old parish churches are ruined in internal effect by the awful doings of the "ecclesiastical decorator!" Do we not know his playful use of sky blue, gold leaf, and vermilion? Are we not familiar with his vivid grounds plentifully bespattered with "Gothic" emblems, utterly un-Gothic in feeling, in colour, and frequently in position? Have we not seen, in almost every church which has had the misfortune to possess—any time in the last fifty years—a benefactor memorially inclined, the vitreous vulgarity of a memorial window, mock-mediaeval in drawing, hot and glaring in colour, shedding its garish light on pews of treacly-looking varnished pine and floors of shiny tiles, and making one long for a gas explosion sufficiently vigorous to blow these obtrusive caricatures to atoms without harming the more substantial fabric? That immense improvements have been, and are still being, made in the particular art of glass painting as in decorative art generally I admit freely, but

there is still a very great deal to be done, and the improvement might be less gradual and more certain if architects in general would follow the example set by men like Mr. Aitchison and Mr. Bodley, and devote more of their time and energy to the careful study of colour and decorative design, not only in mural decoration or glass painting—which is, after all, a species of mural decoration—but also in hangings, wall-papers, carpets, and all the fittings and furniture of buildings, civil and ecclesiastical. I mention Mr. Bodley's name because I see with pleasure that you include him in the list of those at the head of the profession whom you would desire to hear, and because I am afraid that due credit is only given by a very limited circle to the highly-cultivated intelligence, the scholarly attainments, and the numerous and uncommon decorative achievements of that gentleman. Mr. Bodley is a master of colour, as he evinces by his fearless handling of wall and roof decoration in churches, and his treatment of house interiors. He is one of the very few modern architects who appear to thoroughly sympathise with and consistently practise the ancient method of applying colour throughout to the walls, roofs, piers, arches, and even tracery of churches; and he is, furthermore, skilled in the design and colouring of stained glass. Indeed, it is probable that Messrs. Bodley and Garner have designed more stained glass for churches than almost any other living architects.

I can hardly think that the admiration bestowed upon the work of Mr. Burne Jones by the rising generation of artists is that evoked by eccentricity, unless it is so in the sense that any artist who rises above commonplace, and departs from the usual method of his contemporaries, is to be considered eccentric. I would rather attribute the applause to the "more wholesome sentiment" of which you speak. I can scarcely understand, with you, that "the forte of Mr. Burne Jones might prove to be colour-glass work exclusively," for I think we cannot afford to lose him from the wider field of decorative picture painting. I must not, however, trespass further on your space, as I fear my letter has already grown to unwarrantable length.

Yours faithfully,

8 Gray's Inn Square.

E. P. WARREN.

## LEGAL.

### High Court of Justice.

(Before Mr. JUSTICE WILLIAMS and Mr. JUSTICE SMITH.)

HOOKWAY v. LONGSTAFF.

ARCHITECTS' CERTIFICATES.

This was a special case stated to obtain a decision under a building contract, viz. whether or not the certificate of the architect was, under the clauses of the building contract in question, subject to an appeal to an arbitrator, or whether the architect's decision must be taken as final. The plaintiff was a builder, and the defendant was the owner of a mansion at Morthoe, North Devon. The plaintiff contracted with the defendant to make certain alterations to the house and to execute certain other work in accordance with the architect's drawings and specifications for the sum of 4,998*l.* The point in dispute really turned on the printed conditions of the contract, one of which provided that the architect should be at liberty to make any alterations, additions, or omissions to or from the contract, but that such variations were in no way to vitiate or annul the contract. The value of these was to be ascertained according to the usual mode of meaning, and to be regulated by the prices contained in the schedule. Where, however, the schedule had not been supplied or would not apply, the prices were to be determined by the architect in a reasonable manner. Another condition was to the effect that every dispute, difference, or controversy which arose between the employer and contractor, or between the architect and contractor, except as to matters left to the architect's sole decision, should be decided by him without reference to any other person. In this case the architect had given a certificate in respect of "extras," and the plaintiff had complained of the amount allowed under that certificate, and demanded to have the matter referred to arbitration, on the ground that the architect had not ascertained and determined the matters mentioned in the certificate in a reasonable manner. The defendant had declined to have the matter thus referred, and contended that he was not bound to take such a course; and plaintiff's counsel submitted that his client had this right to refer in consequence of the architect not having ascertained the "extras" in a reasonable way.

Counsel for the defendant pointed out that this was a tripartite contract, the architect being a contracting party as well as the plaintiff and defendant. Under the contract the defendant was to pay only the value as ascertained by the architect; and if the architect had not ascertained the value in a reasonable manner, he did not see why the plaintiff should not bring an action against him. The price the employer had to pay was the amount added to or deducted from the contract by the architect, and this provision had been put in the contract to prevent disputes between the parties.

Mr. Justice Watkin Williams said that he was of opinion that there should be judgment for the plaintiff, who was entitled to have the matter referred to arbitration, because it did not come within the clause as being "matters or things left to the sole decision of the arbitrator."

Mr. Justice A. L. Smith concurred. The case is therefore to be referred, and the costs of the special case will be costs of the arbitration.

### High Court of Justice.

(Before Mr. JUSTICE MATHEW.)

SCALES v. REDFORD AND POTTER.

This was an action for personal injuries alleged to have been incurred by the defendants' negligence. The plaintiff was a master slater; the defendants were a firm of builders. In July 1883 the plaintiff was employed by a firm called Roberts & Co. to slate some houses that the defendants were building at Horsham. On beginning the work the plaintiff found that the ladder which the defendants had fixed leading to the roof of the house was not in a convenient position. He accordingly slackened the rope by which the ladder was tied to the scaffolding at the top, and moved the ladder at the bottom. He then ascended again to tighten the rope at the top, and while he was doing so the rope snapped, and, the ladder falling, the plaintiff came to the ground from a height of 25 feet. Injury was done to his wrist and elbow, necessitating medical supervision for six weeks and cessation of work for fourteen weeks. The defendants' case was that the rope was amply sufficient for the purpose for which it was used, and must therefore have been burst by the plaintiff prising the ladder at the bottom without having first untied it at the top, or must have got cut by the plaintiff dropping a slate upon it. The defendants produced two ends of rope, which their witnesses swore was the rope that had tied the ladder. These ends were of strong rope and in good condition, presenting the appearance of having been separated by a cut.

Mr. Justice Mathew gave judgment for the plaintiff for 75*l.*, summing up the case to the following effect:—The plaintiff had only acted in the usual course of his business, and at the invitation of the defendants. The case for the plaintiff was that the rope had been rotten. To meet this, the defendants had produced a sound rope in Court. He (the learned Judge) was unable to believe that that rope was the one used, though he exonerated the defendants themselves of any knowledge to the contrary. The history of the rope was not traced in a satisfactory manner, and no theories had been advanced that could account for the extraordinary way in which it was divided.

### Sheffield County Court.—Feb. 28.

(Before Mr. J. ELLISON, Judge.)

WALKER, EATON & CO. v. JOHN TURTON & CO.

This action, which had been remitted from the High Court of Justice, was to recover a sum of 26*l.* 0*s.* 10*d.*, balance of account for goods sold and delivered. It involved a question of usage in the iron trade. There was a counter claim. The judge said that with respect to one of the items of the defendants' claim, 18*l.* 16*s.*, it seemed to refer to a general custom in the trade for the defendants as customers or rollers to return to the plaintiffs as founders the old metal, and in this case they had returned two old cog-wheels to the plaintiffs. There was no doubt from the evidence of the defendants' witnesses that there was a practice in the trade, a very common practice, of returning the old metal to the founder as part of payment of the current account. There was no question about it. The real question involved in this issue was this—Is there a custom or an implied agreement between these parties obliging the plaintiffs to take old metal back instead of money? And, if so, how is such an implied agreement made out, and when was it created or when did it exist for the first time? These parties had dealt together for some thirteen years. During that time the plaintiffs had delivered large quantities of manufactured material to the defendants, who had used it, and who had from time to time undoubtedly returned old metal to the plaintiffs as part payment, and as money paid by them towards the current account. It appeared to him that all that had been done in the matter between the parties simply amounted to this, that for the whole period of the time of trading, with the exception of the years 1880 and 1881, during which years the defendants did not appear to have returned any old metal, they had returned the old metal, and he (His Honour) thought simply as a matter of convenience between parties. It was quite clear that it was for their convenience that such usage or practice of the trade should exist; but the question was—Is there any custom or implied agreement by these parties which makes it obligatory on the part of the plaintiffs taking this old metal back as money? He found a negative to that proposition, and said it was simply a matter done for the sake of convenience. There was neither a custom or an implied contract which justified the claim of 18*l.* 16*s.*, therefore, with the exception of 13*s.*, the issue would be found entirely in favour of the plaintiffs.

## WORKS IN PROGRESS.

**St. Arvan's Church, Chepstow**, which has been reopened for divine service, is lighted by Hesperus and Duplex Lamps, the gift of a gentleman connected with the parish. These, in addition to a brass lectern, were supplied by Messrs. Jones & Willis.

**Mr. S. B. Burton**, Newcastle-on-Tyne, has just completed the roofing of the following churches for Mr. C. Hodgson Fowler, architect, of Durham:—Stillingfleet, near York; Hebburn Colliery Company Church, near Durham; and Broadway Church, near Worcester. They were covered by the Hartshill Brick and Tile Company with their red roofing tiles, the tiles for the roof of Broadway Church being strawberry coloured.

**Messrs. Woodhouse & Rawson**, of Queen Victoria Street, have been awarded a diploma of honour for their incandescent lamps exhibited at the Fisheries Exhibition.

**The Walls of the Central Technical Institute**, South Kensington, throughout the entire buildings, are being decorated with "Orr's Durescò," as manufactured by Messrs. J. B. Orr & Co., of Charlton, S.E.

**Messrs. C. C. Dunkerley & Co.**, of Manchester, who have just completed the girder contracts for the Olive Spinning Company (Limited), Oldham, and the Duke Spinning Company (Limited), Shaw, near Oldham, have, we learn, secured the contracts for the girders for the Fern Spinning Company (Limited), Shaw, near Oldham, and Patricroft Spinning Company (Limited), Patricroft, near Manchester.

**The Red Bricks** for Messrs. Holland's new premises in Oxford Street were supplied by the firm of Messrs. Thomas Lawrence & Son, brick and tile manufacturers, &c., of Bracknell. The gauged and moulded and carved brickwork is of first-class workmanship. Messrs. Lawrence are at present again enlarging their works for the coming season.

## CHURCH BUILDING AND RESTORATION.

**Newcastle-on-Tyne**.—St. James's Congregational Church, Bath Road, which has been built in place of the small church at the corner of Grainger Street and Blakett Street, has been opened. The new church and schoolroom, &c., have been erected by Mr. Walter Scott, contractor, from designs prepared by Mr. T. Lewis Banks, Finsbury Circus, London, and the cost of the site, buildings, furnishing, &c., has been 16,500*l*.

**Burton-on-Trent**.—The blank space under the window of the north transept of St. Paul's Church has, at the cost of Mr. Bass, been filled in with a wall arcading of three arches, subdivided into six panels, and carried upon polished and selected Irish marble shafts separated by carved crockets and ball flowers. The mouldings of the arches, &c., are deeply cut under, and enriched with ball flowers, the whole surmounted by a second arcading of narrow niches. The work has been carried out by Mr. H. D. Kershaw, from the designs of Mr. R. Churchill, architect. The carving was executed by Mr. J. Roddis, of Birmingham.

**Llanfechain**.—The ancient parish church of Llanfechain has been reopened after restoration. The work has been done by Mr. David Edwards, contractor, of Llanfechain, the architect being Mr. Douglas, of Chester, and Mr. Muspratt clerk of works. The oak-work in the chancel, screen, seats, and lectern has been done by Messrs. W. & G. Thomas, of Oswestry. The painting of the *Nativity* between the windows over the altar has been executed by Mr. E. Frampton, of London.

## NEW BUILDINGS.

**Tiverton**.—The new Drill Hall and Public Hall erected at Tiverton, from the designs of Mr. Mitchell, architect, of Southampton, has been opened. The tender of Messrs. Manning & Deering, of Tiverton, was originally accepted for the erection of the building at 1,572*l*. Additions subsequently made increase the cost to 2,000*l*, making the total outlay about 3,000*l*. The premises comprise a spacious hall, 80 feet by 50 feet, the ceiling of which is 40 feet high at the apex, and the walls 20 feet. In addition to the main entrance there is a side door. The hall is also provided with two "panic" doors, to enable a crowded house to clear in less than two minutes in case of emergency. A double floor has been laid down, the under one permanently fixed being intended for dancing purposes, and an upper one for general use, made in sections in order to be easily removed. At the southern end of the room is an alcove with platform 17 feet wide by 30 feet long. On either side are retiring-rooms 17 feet by 9 feet each. In front of the hall facing the road is the dwelling-house of the drill instructor, armoury, orderly-room, and suite of rooms used for a gentleman's club. The frontage of the building is of red brick, tuck pointed, with Bath stone dressings.

## ARCHÆOLOGY.

**The Colchester Museum**.—Mr. J. E. Price, F.S.A., has arranged and prepared a catalogue of the Roman and Mediæval antiquities in this museum. The collection is now, for the first time, classified and scientifically arranged, so that instead of a mere gathering of independent specimens of greater or less interest, it becomes a museum in which Roman art and Roman history can be studied with a completeness that cannot often be attained. The collection has an almost world-wide fame, and had it but been possible in past years for the Colchester Museum to have acquired all the remains of Roman Colchester that unorganised excavation has brought to light, it would be unrivalled. Mr. Price's catalogue is not a mere inventory. He has carefully described all the specimens, and where any special interest attaches to them, has introduced historical notices of the class of objects to which they belong, illustrating these notices by reference to other objects of similar kind, and giving sketches and engravings in corroboration of his remarks. The catalogue may almost be called a history in itself of Roman arts and manufactures. It is to be hoped that the result of so much labour—labour of love it must have been, but still labour of no ordinary kind—will not be allowed to remain in MS. in the comparative seclusion of the Colchester Museum. Mr. Price has expressed an intention of elaborating this catalogue into an exhaustive work upon Roman Colchester, dealing with the history and fortunes of the colony from the time of its first foundation down to its final abandonment. Mr. Alma Tadema, R.A., has recently paid a visit to Colchester, inspecting the Town Museum as well as the private collection of Mr. George Joslin, with the object of selecting specimens of Roman pottery for introduction into a forthcoming picture. One of Mr. Alma Tadema's pupils has been engaged for the last month in making beautiful drawings of the Colchester urn, and also of another specimen given to the museum by Monsignor Virtue.

## GENERAL.

**Mr. H. S. Marks, R.A.**, has been "specially elected" by the committee as a member of the Athenæum Club.

**Mr. William Agnew, M.P.**, has presented to the Manchester Art Museum Committee some pictures and casts, specially selected for the particular objects of the Art Museum.

**Messrs. Edbrooke & Burnham**, architects, of Chicago, are the successful competitors for the plan of the new Georgia capitol.

**Mr. J. Medland Taylor**, architect, of Manchester, has prepared plans for the erection of a tower and spire to Poynton Church, which will form a memorial of the late Lord Vernon.

**A Paper** on "Iron Construction" was read by Mr. N. R. Yeomans at the last meeting of the York Architectural Association.

**Messrs. Brown & Humphreys**, architects, of Luton, have dissolved partnership.

**The Normand Memorial Hall**, Dysart, is being erected from the designs of Mr. R. Rowand Anderson, A.R.S.A., Edinburgh. The foundation-stone was laid on Saturday last.

**Sunday-schools**, erected from the designs of Mr. G. D. Oliver, in West Tower Street, Carlisle, have been opened.

**Tenders** for the restoration of Sherborne Abbey Church tower are to be obtained from a few local builders only. Mr. R. H. Carpenter is the architect.

**Messrs. Preston & Vaughan**, of Manchester, have prepared plans for the erection of the Hope Memorial Schools and Mission Church, in connection with the parish of Christ Church, Heaton Norris.

**The Aberdeen Town Council** have authorised the execution of a contract with M. Severin Van Aerschodt, bellfounder, Louvain, for the supply of a peal of thirty-six bells for the tower of St. Nicholas' Church at a cost of 2,690*l*.

**The West Bromwich Town Council** on Wednesday agreed to apply for permission to borrow 53,100*l*. for the construction of a low-level intercepting sewer and subsidiary sewers.

**Pepys' Memorial**.—The result of the labours of the committee formed to consider the best means of obtaining a satisfactory memorial of Samuel Pepys, the diarist, is an appropriate monument, designed by Mr. A. W. Blomfield, which has been erected in the Church of St. Olave, Hart Street, E.C., where Pepys is buried. The monument will be unveiled by the Right Hon. the Earl of Northbrook, K.C.S.I., First Lord of the Admiralty, on Friday, the 14th inst., at 3 P.M., and His Lordship will be assisted on the occasion by His Excellency the United States Minister. We understand that the committee still require some more subscriptions.

**The Panama Canal Works** are, according to the report of the chief engineer, Mr. Dingler, being actively proceeded with on fourteen sections of the canal. Within the last few months four million cubic metres of earth have been removed. About eighty million cubic metres constitute the whole amount of earth to be got away before the canal is completed, and it is hoped that it will be finished in three and a half years.

# The Architect.

## MR. SHAW-LEFEVRE ON LONDON.

THE present First Commissioner of Works has proved himself on many occasions to be exceptionally well qualified for the important office he happens to hold; and when we speak of the office he *happens* to hold, we imply even an augmented admiration of the way in which he performs its work. Mr. SHAW-LEFEVRE has, in short, strikingly distinguished himself from his predecessors of as long a time as one can well remember, by manifesting, not only in a special degree the qualities of a clever man of business,

but almost equally those of a man of what is called good taste. In the Parliamentary system which on the whole suits us so exceedingly well that no one nowadays ventures, except in one or another form of jesting, to acknowledge a passing thought to its prejudice, there is one principle of practice which seems to be universally recognised, namely, that every enterprise connected with the Government shall have at its head, not nominally but really, a Parliamentary debater. Even when at this moment there is one M.P. in the seat of the Lord Mayor and another in the chair of the Metropolitan Board of Works, although it may be said that accident has a good deal to do with such a coincidence, yet every one must recognise in it an instance of the fitness of things; and when it has been argued, as it often has, that the architectural work of the Government, as a most exceptional duty, ought to be placed under the control of some sort of professional expert, not only has the practice been continued of preferring a Parliamentary administrator, but, when such a one could haply be found who was also acquainted with architecture, or any other art, if only as an amateur, the preference has still always been given to the possessor of no such qualification. Matters are changing a little now, but the rule has generally been to call a country gentleman to the office, literally in his capacity of a country gentleman; and, if Mr. SHAW-LEFEVRE is a man of business and a man of a little taste, it is not too much to say that it is still only as the equivalent of a country gentleman that he is generally supposed to have been appointed; indeed we should not be at all surprised to be told that, like Mr. AYRTON (who, by the way, was not a country gentleman, and therefore a failure) he had received his appointment with the frank remark that he could only recognise, as a reason for its bestowal, the fact that he had no personal knowledge of its subject. But be all this as it may, we see in Mr. SHAW-LEFEVRE very much what, under such a system, we ought to desire to see—a working politician whose mind is large enough, his courage earnest enough, and his general culture sufficiently liberal, to admit of his undertaking whatever artistic enterprise comes, amongst the rest, in his way, with that intelligent and painstaking confidence which, if in unfavourable circumstances it is the surest road to failure, is the surest road to success when guided by sound sense and loyalty to the cause. The other day we found a provincial enthusiast sending an invitation with authority to Mr. HERBERT SPENCER, to accept, as we may say, a seat in the House of Commons; an invitation which the philosopher very properly declined to entertain. Suppose some similarly ardent and influential leader were to ask, on popular artistic grounds—which are quite as good as the popular philosophical, if not better—Mr. RUSKIN or Mr. WILLIAM MORRIS, Mr. FERGUSSON or Mr. President JONES, to claim the post of M.P., for the sake of the First Commissionership of Her Majesty's Works; we feel sure we are saying quite enough to secure general approval if we remark that we would very much rather have Mr. SHAW-LEFEVRE than either of them, or all together. We may perhaps put the case thus:—that English public opinion, taking it as it stands, is clearly in favour of the supreme control of public works being in the hands of an unprofessional, and therefore unsophisticated, but experienced public man, who has the good sense to take private advice where it is to be had of the best quality, and the self-reliance to assume the responsibility of

acting upon it to the best of his own rough and ready judgment as a man of business and nothing more.
